People ex rel. Qua vs. Gaffney et al.—Where in a civil service examination to determine eligibles for appointment to the office of sewer, water and street commissioner and to the office of street superintendent of a village three persons were certified, one of whom was a veteran, the veteran was entitled to a preference of appointment under Constitution providing that appointments in the civil service shall be made according to merit, to be ascertained so far as practicable by examination, provided, however, that honorably discharged soldiers and sailors shall be entitled to preference without regard to standing.—New York Supreme Court, 126 N. Y. S., 1027.

Paving Assessment—Corner Lots

McDonnell et al vs. Improvement District No. 145 et al.—Where in levying assessments on property within an improvement district for the paving of a street the commissioners, in assessing certain corner lots, considered the fact that they fronted on another street already paved, and for that reason did not receive benefit in the same proportion as other lots fronting entirely on the streets improved, and therefore should not bear so great an assessment, that fact did not establish as a matter of law that the assessment was based on an erroneous theory, nor show that the commissioners were guilty of an abuse of discretion authorizing the vacation of the assessment in a court of chancery.—Supreme Court of Arkansas, 133 S. W. R., 1127.

Water Companies—Rates—Ordinances

Contra Costa Water Co. vs. City of Oakland et al.—The legislative body fixing rates for water furnished by a corporation supplying a city with water, on determining the present value of the property used in the public service, must fix such rates as will allow the corporation a fair return over and above its operating expenses, taxes and current repairs, and the annual depreciation in the property, and the questions of the value of the property and the amount of expenses, allowance for depreciation and fair compensation are for the legislative body, and the courts will not set aside its action on the ground that it deprives a corporation of its property without fair compensation unless that fact clearly appears. In the absence of a finding on the question of the value of the property of the corporation the court cannot determine that the compensation afforded by the ordinance is not reasonable, and, where reasonable, the corporation cannot complain in the courts because of the methods used by the City Council in arriving at the conclusion embodied in the ordinance.—Supreme Court of California, 113 P. R., 669.

Construction of Improvements—Negligence

Reynolds County Telephone Co. vs. City of Piedmont.—Where a telephone company laid its cable under a street without obtaining the city's consent, as required by statute, the city was not liable for damage to its cable by its being struck by a pick of one of the city employees attempting to loosen the rock and cement to remove the cable in repairing the sewer, where it appeared that the injury was caused either unintentionally or by the city employee's failure to carefully guard the point of his pick, the city not being liable unless it wilfully or recklessly injured the cable.—Springfield Court of Appeals, Missouri, 133 S. W. R., 141.

Pavement Maintenance—Construction of Contract

Mack Paving Co. of New York vs. City of New York.—A contract to repave the streets of a city and to maintain the same for a specified period after acceptance, which stipulates that the contractor agrees to make repairs, and during the period of maintenance to take up, lay and restore on notice the pavement over trenches for water and gas pipes and sewers or other purposes at a specified price, does not give the contractor an exclusive right to relay a pavement during the period of maintenance, and the act of the city in permitting a railway company, required by Railroad Law, as amended by Laws 1892, to keep in repair the part of the streets used by its tracks, to take up and repair a street at its own expense by employing another contractor, is not a violation of the contract, since the railroad company, not being a party to the contract, is not bound thereby, and since the city does not agree to pay for such work.—New York Supreme Court, 127 N. Y. S., 738.

Establishment of Sewer District—Validity

Mayer et al. vs. City of Shakopee et al.—Laws 1903, which delegates to cities of the fourth class the power to establish sewer districts, is not unconstitutional because it requires that each lot or tract of land within the district shall be assessed for the cost of the improvements, in the ratio of area in square feet to the total assessable area of the district. By the provisions of Chapter 312, Laws 1903, in establishing sewer districts and sewers therein, the Common Council is required to exercise its judgment so as to include within the district such real estate as will be benefited by the improvement, and to apportion the cost thereof on all of the property according to the benefits. In the establishment of a sewer district and sewers therein by the Common Council of the city of Shakopee the evidence is not sufficient to show that the Council proceeded upon an illegal principle, applied a wrong rule of law or acted upon a demonstrable mistake of fact.—Supreme Court of Minnesota, 130 N. W. R., 77.

Taxation—Underground Railroad

People ex rel. Hudson & Manhattan R. Co. vs. State Board of Tax Com'rs et al.—The mere fact that the value of special franchises to construct and operate an underground railroad under the streets of the city of New York cannot be ascertained with accuracy is not ground for annulling an assessment of the franchises, where the owner urged that the property was overvalued or valued at a higher proportionate value than that placed on other property on the same roll. Under Tax Law authorizing a petition complaining of an assessment by reason of overvaluation, and requiring the petition to state the extent of such overvaluation, and authorizing the court to order a reassessment to make it conform to the valuations of other property on the same roll, etc., a petition on certiorari to review an assessment of special franchises must state the valuation of the franchises and set forth the material facts to show a disproportionate valuation in order to enable the court to determine the questions of overvaluation and of higher proportionate valuation than that placed on other property. Where a corporation, on certiorari to review an assessment of its special franchises to operate an underground railroad under the streets of the city of New York, does not show the probable cost of equipment of its lines and the annual operating expenses, with a view to show that the net income, after allowance for depreciation and interest on the investment capitalized, will not equal the assessment, it is not shown that the assessment is unauthorized, either under the net earning rule or on the theory of the cost of reproduction of the tangible property in connection with the value of the intangible property, and the assessment must stand. Under Tax Law defining the terms "land," "real estate" and "real property" to include land, underground railroads, including the valuation of franchises to construct and operate the same, and defining a "special franchise" to include the value of the tangible property of a corporation situated in or under or above any street, a corporation owning special franchises to operate an underground railroad under city streets owns special franchises subject to taxation, though only so small a part of the railroad is constructed and in operation as is insufficient to meet operating expenses, taxes and interest, and the franchises, if possessing a value, are taxable, though they are not used. The State may tax a corporation on its special franchises, granted to it by the State, or by authority from the State wholly within its limits, though the corporation is engaged in interstate commerce, because the tax is not on the business of the corporation.—New York Supreme Court, Appellate Division, 127 N. Y. S., 918.

Land Condemnation—Compensation

In re Simmons et al., Board of Water Supply.—A municipality condemning land should be held to at least its lowest value.—Evidence held to show that wards for land taken by New York City for water supply purposes are too low. The value of rural church property condemned for municipal water supply purposes should be fixed at the value of the land as enhanced by the buildings thereon, taking the reasonable cost of replacing them and considering their state of repair and depreciation.—New York Supreme Court, 127 N. Y. S., 940.

Street Improvements—Special Funds

O'Neil vs. City of Portland.—Where the expense of improving a city street is to be paid from a special fund created by assessment on abutting property, a failure of the municipality to comply with any of the requirements in the charter, essential to supplying such fund or an unreasonable delay in enforcing such provision or collecting and paying over the money, gives the contractor a right of action ex delicto against the corporation for damages, notwithstanding a provision therein that he shall look for payment only to the special fund. A complaint of a plaintiff who had a contract with a city to improve certain streets, to be paid from assessments collected, alleging that owing to the negligence of the city in making an assessment, and its failure to exercise due diligence in prosecuting suits brought by property owners affected, whereby it has already failed to provide a special fund to pay for the improvement for nearly five years, whereby plaintiff has been damaged, states a cause of action.—Supreme Court of Oregon, 113 P. R., 653.

Pavement Maintenance—Construction of Contract

Asphalt Paving & Contracting Co. vs. City of New York.—Where a contract for an asphalt pavement over a stone block pavement bound the contractor to keep the pavement in repair for fifteen years, and with a sufficient foundation and an asphalt pavement would begin to need repairs in four or five years, the contract will be deemed to contemplate the necessity of repairs during at least ten of the fifteen years, and not to be a guarantee that the pavement, laid with the best material and workmanship, would not require repairs for fifteen years, and the contractor cannot avoid making repairs within the prescribed period on the ground that defects were not due to inferior workmanship or material but to defective plans of the pavement. If defects in the plan of a pavement or insufficiency of the pavement render the contract requiring the contractor to make repairs impossible of performance, both parties to the contract would be excused from further performance, and neither could recover damages for the part not performed. Where a paving contract provided that notice to make repairs should be served on the contractor either personally or by leaving it at its residence or on its agent in charge of the work, the service upon another company acting as agent of the contractor in making repairs under the contract was sufficient.—New York Supreme Court, 127 N. Y. S., 794.

Towns—Actions—Parties

Town of East Greenwich vs. Guenond; Guenond vs. Superior Court.—Under Gen. Laws 1909, declaring that the inhabitants of every town shall be a body corporate and may sue in their corporate name, and providing that every suit by a town shall be brought in the name of the town, and a chapter authorizing a warrant in forcible entry and detainer, where complaint under oath is made by complainant or some one in his behalf, etc., a town sergeant, though authorized by a vote of the town council of a town to take all steps necessary to eject any person occupying certain real estate, may not as sergeant make complaint on behalf of the town in forcible entry and detainer; but the action must be brought in the corporate name, even though chapter authorizing the town council to sue in the name of the town be applicable, since that requires the action to be brought in the name of the town by the town council.—Supreme Court of Rhode Island, 78 A. R., 1015.

Highways—Construction—Damages

Adkins vs. Crawford County.—The court below erred in sustaining a general demurrer to the petition in a suit brought against a county, wherein it was alleged by the plaintiff that she was the owner of certain lands lying within the county referred to and that the commissioner of roads and revenues of said county had cut a public road through her land and had taken her land for the public use without her consent, and by the manner of cutting said road had caused large quantities of rainwater to be diverted onto her cultivated land, resulting in damages to the land and rendering a large part of the same unfit for cultivation, to her injury and damage in a stated sum, and that she had demanded damages in writing from said commissioner who had refused compensation for the injury and damage done.—Supreme Court of Georgia, 70 S. E. R., 335.

MUNICIPAL APPLIANCES

Pick-up Street Sweeper Exhibited in New York

ONE of the most interesting of the devices for cleaning street pavements, which were recently exhibited in New York for the benefit of a committee of the Board of Estimate and Apportionment which had been appointed to make a general study of the subject, is the Emerson street sweeping machine. This machine is auto-propelled and operated. It loosens the scale of mud from the street, sprinkles lightly in front of a broom which picks up the sweepings and delivers them to a bin which is a part of the apparatus. At the same time a moderate draught of air produced by a fan sucks the dust into the machine so as to reduce the dust nuisance to a minimum. In addition to the committee, composed of Commissioner Thompson of the Department of Water Supply, Gas and Electricity and Borough President McAneny of Manhattan, the operation of the machine was observed by officials of the Street Cleaning Department, the Commissioner of Accounts and representatives of various civic societies. Whatever may be the opinion of these observers regarding the advisability of adopting the Emerson system—the question of costs was not taken up—the verdict was unanimous that the sweeper did good work and did not fail or break down at any time. Consulting Engineer Very of the Department of Street Cleaning calls it a practical working machine; the Commissioner of Accounts says it swept the street well, removing dirt from depressions of at least an inch in depth; Secretary Robert S. Binkerd of the Civic Club says it cleans the pavements as well as any street sweeper.

The general outline of the Emerson sweeper, as shown by the illustration, is that of a large covered van. The extension at the rear carrying the rotary

brush and conveyor is the only conspicuous feature which differentiates it from an ordinary commercial vehicle. The auto-apparatus occupies the usual position of such machinery. The covering of the van, carrying the dust bin, is made of aluminum to save weight. On top of the body proper is a tank which carries water for the sprinkling device which is located immediately in front of the brush so that the water is picked up before spreading. Under the machine, between the front and rear wheels, is a rake controlled by the operator, which loosens the scale of dirt from the pavement. The dust bin is emptied through bottom doors, the hinges of which show in the cut. The chains and sprockets that drive the broom and conveyor are plainly shown. The chauffeur is seated in a closed space in the usual position. A seat is provided at the rear near the top of the body, where an operator sits and controls the lifting and lowering of the broom and its casing as well as watching the quality of the work done.

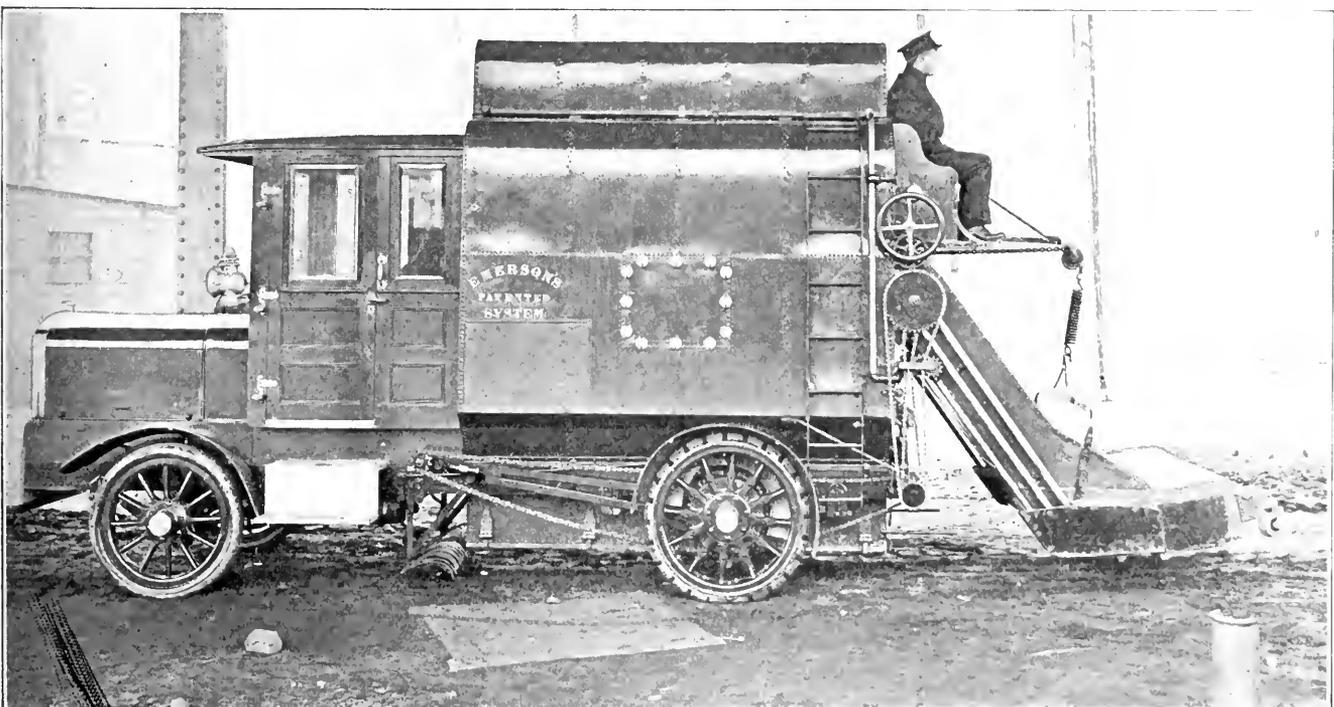

The company had two machines on exhibition. The smaller of these sweeps a width of 5 feet. It has an 11-foot wheel base, is 23½ feet long over all, weighs 3 tons empty and has a capacity of 5 cubic yards. This capacity is estimated to be sufficient to carry the collections of half a day's work. The dirt becomes compacted quite hard in the bin so that the quantity carried is greater than might be supposed. The larger machine sweeps a width of 9 feet, weighs 8 tons, has an 11-foot wheel base and measures 26 feet over all and has a storage capacity of 10 cubic yards. The water tank for the small machine carries 250 gallons and that on the larger machine 650. In the large machine the water is forced through the sprinkler by air supplied by a small compressor. The brooms are about 15 or 18 inches in diameter and revolve rapidly. They are made

SWEEPERS WORKING IN GANGS

of different materials—hickory, rattan, steel—to meet varying conditions. The speed of the machine may be anything up to 10 miles per hour. The speed during the tests, according to eyewitnesses, was about that of a horse walking, or three miles an hour. The amount of water used is about 40 gallons to each 1,000 square yards.

The lack of definite recommendations so far regarding the machines is due to the fact that it is realized that the adoption of the Emerson system is a big proposition. The machines are not for sale and the Emerson Contracting Company, inventors and owners, desire to take large contracts for street cleaning. Regarding the cost officials of the company state that it would not be any greater than by methods now employed, and in addition there is a sanitary advantage in the fact that the dirt is picked up immediately instead of being left in the gutters for a few hours, as is often done. Moreover the dust nuisance, it is claimed, is eliminated. The proper operation of the system requires the use of two or preferably more machines working in gangs. To clean a

AUTOMOBILE STREET SWEEPER, WHICH PICKS UP THE SWEEPINGS

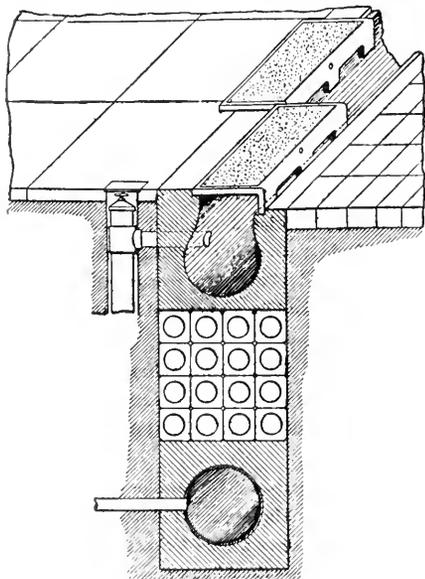

strip 5 feet wide and a mile or so long would not accomplish much good because by the time the machine returned to the starting point wagons would have tracked dirt over the first swath. Therefore the machines should be operated together, as shown in the illustration. To make the system complete a gutter sweeping machine, also owned by the company, should be used. This does not pick up dirt, but gets in close to the curbing and throws the dirt out where the large machine can pick it up. This plan does away with one of the greatest inconveniences and sources of expense in connection with ordinary machine street sweeping, since in this work it has never been possible to get rid of the services of the laborer and the cart.

Curb-Conduit System

The Marriott curb-conduit system, invented by James C. Marriott, Park Row Building, New York City, is designed to facilitate street cleaning, surface drainage and snow removal. The simplest form of the system consists in placing an open conduit at the curb line of a street and connecting it at intervals to a water pipe provided with a valve and a sewer system or body of water. To dispose of snow, where this system is installed, it is heaped by mechanical sweepers or other means near the curb-conduit. When this has been done in a certain section the valve in the supply pipe is opened and the snow is shoveled into it; the snow is partly melted by the latent heat in the water and the rest floated off to the sewer.

The advantage claimed for the operation of the system in ordinary surface drainage is that open gutter streams are abolished. The capacity of the conduit is intended to be such as to do away with the necessity of storm sewers. The use of a perforated plate over the gutter affords access of the storm water, and the plate makes the surface of the pavement substantially continuous.

The illustration shows how the simplest form of the system may be combined with equipment for public utilities. The arrangement shown obviates tearing up roadways to make connections with water, gas, telephone and electric service. At a short distance below the conduit it is proposed to

CURB CONDUIT SYSTEM

20TH CENTURY ROAD OILER AND PRESERVER

construct an electric conduit. If these should be owned by a municipality revenue from the leasing of ducts would be a possibility. Below the electric conduit water and gas mains or sewers might be installed. Regarding the water supply the inventor suggests the use of river or salt water; that is, a cheaper supply than that suitable for drinking purposes. This could be used in some instances for cleaning and sprinkling streets, flushing the lavatories of office buildings, manufacturing and miscellaneous purposes.

A diagram prepared by the inventor shows four types of construction in reference to the matter of covering. One design shows the cover, consisting of an open grating, carried out on the grade of the sidewalk, the vertical portion of the cover practically forming a curbing and provided with open inlets for water. Another style varies from this only in the absence of the grating. A third style has circular perforations in the plate which is laid continuously with the grade of the roadway. The curb conduit may also be left open without any plate.

Storage Battery Car

THE Edison-Beach storage battery car was recently given a successful official test on the York and Dauphin street lines, Philadelphia, Pa., in the presence of Mayor Reyburn and officials of the city and the Rapid Transit Company. The car weighs 13,100 pounds, has seating capacity for 26 and standing room for 20 more. The wheel base is 8½ feet. The power is supplied by a 100-cell Edison storage battery located beneath the seats, which run lengthwise of the car. These are claimed to be able to run the car 225 miles under favorable conditions.

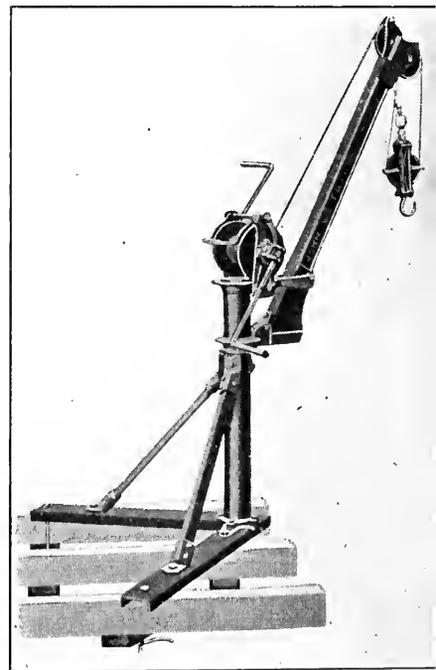

The 20th Century Road Oiler and Preserver

A road oiler in which the oil is sprayed over the road by means of a gasoline engine and pump has been placed on the market by Walter S. French & Co., Moorestown, N. J. The apparatus consists of a tank wagon of ordinary design, a gasoline engine and pump at the rear, a horizontal distributing pipe with a series of vertical nozzles directed downward from it. Two men are required to operate the machine, a driver and an attendant who is provided with a seat at the rear at one side where he can control the gasoline engine and the valves of the distributing apparatus as well as observe

the quality of the work done. In order to make the oil work easier and use no more than is necessary the oil in the tank is heated by water from the water jacket of the engine which is carried through radiators in the bottom of the tank by large pipes. The system of nozzles through which the oil is forced is controlled by a single lever acting instantaneously on the flow of oil, which is easily controlled by the operator. The manufacturer states that the control is so accurate that the oil can be shut off and on within a single inch of a given line, a feature of great advantage when passing over a cross-walk.

Portable Steel Derrick.

JOHN L. TAYLOR, 1034 West Lake street, Chicago, Ill., manufactures a portable steel derrick suitable for unloading curbstone and flagging from cars and for many other purposes. The derrick is constructed entirely of malleable iron and steel, has roller bearings and circle swing. The speed is adjustable. One man operates both cranks and can hoist 1,500 pounds.

A HANDY PORTABLE DERRICK

NEWS OF THE SOCIETIES

City Marshals and Police Chiefs' Association of Texas.—What it is hoped will be a big reunion of the peace officers of the Southwest will be held in Fort Worth, Tex., May 17 to 19, at the time of the seventeenth annual convention of the City Marshals and Police Chiefs' Association of Texas. Invitations have been sent out asking the attendance of the officers, and those in charge will be prepared to care for 1,000 peace officers and hope that many will attend. Secretary-Treasurer M. T. Forrest of Houston, of the Texas association, is the authority for the statement that extensive preparations are making for the reunion. At this meeting it is hoped there will be originated a widespread movement for the suppression of crime and the punishment of criminals in the Southwest. Recently a meeting of criminologists was held in Washington, D. C., whereat methods for the mutual aid and assistance of various police departments were formulated, and the proposed meeting here will endeavor to do similar work, but to evolve methods that will apply with more especial force to the Southwest and its needs as to police protection. Noted speakers familiar with the work of running down criminals, on methods of preventing crime and so on will be present to consider and discuss these questions. For the meeting all elective peace officers, members of the association, will be furnished free transportation and the committee on transportation is now trying to get specially low railway rates for the others who may attend the meeting. The transportation committee is J. H. Maddox, Commissioner of Streets in Fort Worth; Carroll Pates, City Marshal, San Angelo; T. J. Coggins, special agent of the Santa Fe at Temple; George Ellis, ex-Chief of Police, Houston, and John R. Snider, Chief of Police, Amarillo. In the circulars relating to the meeting peace officers are urged to lay aside other business and attend the meeting, for it will be well worth their while to do so. Mayor W. D. Davis, Chief of Police Polk, the City Commissioners, all of the city and county officials and the entire city police force will constitute the reception committee.

Architecture and Building Show, New York.—An architecture and building show is to be held at the New Grand Central Palace, New York City, May 6-13 inclusive. It is planned to make this the first annual exhibition and conference of American architectural building, contracting and engineering interests. Building materials and manufacturers' supplies will be placed on exhibition and a programme of lectures of interest to architects, engineers and contractors is being arranged. Further information regarding the show may be had from A. D. V. Storey, general manager, Architecture and Building Show Committee, No. 110 West Thirty-fourth street, New York City.

Grandville Avenue Improvement Association, Grand Rapids, Mich.—At a meeting March 23 City Engineer L. B. Cutcheon addressed the members on the subject of Grade Separation. He was introduced by President Brower of the association. Myron H. Walker explained the difficulties which confronted the charter commission.

International Municipal Congress.—The executive committee of the League of California Municipalities, of which Mayor Hodgehead of Berkeley is president, recently took steps to carry out the resolution adopted at San Diego last September regarding participation by the cities of California in the International Municipal Congress and Exposition to be held in Chicago this year. The plans under consideration by the league include the exhibition of stereopticon views showing not only municipal achievement and public buildings but also the principal private buildings of our cities and towns. These views will be made from photographs and will be in colors. They will be thrown on screens by automatic machinery and will enable each view to be exhibited at least fifty times a day. Besides this it is proposed to issue 50,000 illustrated booklets as souvenirs for free distribution at Chicago. These will be profusely illustrated with half-tone engravings. The expense is to be borne by the cities and public spirited citizens desiring to take advantage of the unusual opportunity thus afforded to show the world the municipal progress that has been made in San Francisco and the State. The League intends to make a strong effort to secure the next Municipal Congress and Exposition for San Francisco in 1915. Mayor P. H. McCarthy has addressed a letter to the delegates in this regard, and the Supervisors unanimously passed a resolution inviting the cities of the world to hold a Municipal Congress and Exposition in San Francisco in 1915 under the auspices of the League of California Municipalities. The delegates who will attend the International Municipal Congress and Exposition at Chicago in September of this year have been authorized to formally extend to the cities of the world, on behalf of the people of this city, an earnest invitation to attend and hold the next congress in San Francisco.

New England Water Works Association.—A special meeting of this association will be held at the Hotel Kimball, Springfield, Mass., Wednesday, April 12, 1911. Programme—12 o'clock m.—Meeting of the executive committee. 1 o'clock p. m.—Lunch will be served at the Hotel Kimball. 2 o'clock p. m.—Representatives of the city government will welcome the association. E. V. French, vice-president and engineer of the Arkright Mutual Fire Insurance Company of Boston, Mass., will present a paper on Desirable Pressure at Hydrants. The general subject of Fire Protection will be discussed by William H. Daggett, Chief of Fire Department, Springfield, Mass., and others.

Chicago Association of Commerce.—At a meeting at the Hotel La Salle J. P. Hovland spoke of the movement, to be aided by the association, of beautifying the downtown section. He said that the business men downtown were anxious that the central section should suggest to visitors some of the beauty of the outer city.

Youngstown Engineers' Club.—The members of the club met March 23 in their quarters in the Maloney Block. The meetings are rapidly growing in attendance and the club is one of the most flourishing in the Mahoning Valley. The principal topics of discussion at this meeting were the various bills regarding engineering matters pending in the Legislature.

Toledo Heights Citizens' League.—A new municipal improvement society with the above title was recently organized. The organization will act in conjunction with the South Side League, recently formed for a similar purpose. The following officers were elected: President, Dr. H. H. Havinghorst; vice-president, Dr. F. A. Cobb; second vice-president, E. D. Fearing; secretary, George Johnson; treasurer, Michael McDermott.

National Arts Club.—Efforts to make New York more attractive will be made manifest at a show soon to be held in the galleries of the National Arts Club, No. 119 East Nineteenth street, New York City. The Municipal Art Society will include exhibits by such city departments as the Park, Dock, Board of Water Supply, etc. The president of the Municipal Art Society is Bert Hanson, former Commissioner of Police; the secretary, Charles H. Israels, an architect.

Conference of New York Mayors.—William P. Capes, of Schenectady, secretary of the Advisory Committee on the Mayors' Conference to be held at Poughkeepsie, N. Y., May 25 and 26, has announced that the speakers who have already sent their acceptances are Governor John A. Dix; Mayor William J. Gaynor, of New York; E. A. Fisher, City Engineer of Rochester; A. Prescott Folwell, editor of the MUNICIPAL JOURNAL AND ENGINEER, New York; W. D. A. Ryan, of Schenectady, head of the illuminating engineering department of the General Electric Company and the greatest authority on street lighting, who is to give an illustrated lecture on street lighting; C. R. Hall, head of the Department of Examiners of Municipal Accounts in the State Comptroller's office; Hon. William Prendergast, Comptroller of New York City; Hon. Homer Folks, of New York, secretary of the State Charities Aid Association; Lawson K. Purdy, Tax Commissioner of New York, general land and tax agent of the Erie Railroad, and State Senator Harvey D. Hinman, of Binghamton. There are six speakers to whom invitations have been sent that are yet to be heard from.

Kay County (Okla.) Good Roads Association.—The association has adopted a new idea in the construction of culverts, suggested by Neal A. Pickett, Arkansas City. The idea is to build open concave cement gutters across the roads to carry off storm water. It is not intended to use the culverts when there are permanent streams. The gutters or culverts will be so shallow that they will not be an obstacle to vehicles.

Civic Club of Binghamton, N. Y.—At a regular meeting, March 22, Mrs. Frank D. Lyon gave a stereopticon lecture upon the subject River Banks. Views of cities, some of them larger, many of them smaller than Binghamton, which have beautified their river banks to a remarkable extent were shown in sharp contrast to the view of the banks of Binghamton's two rivers, strewn with garbage and ashes and surmounted with buildings of the most disreputable order, and used, to a large extent, as signboards for the advertisement of all sorts of commercial commodities. The speaker made a number of apt suggestions in regard to the ways in which the waterfront could be improved. Of special merit was that regarding the conversion of Chenango Point, the junction of the two rivers into a park.

National Electric Light Association.—Charles H. Hodskinson, master of transportation of the National Electric Light Association, is already taking active steps to organize his important work in advance of the convention to be held in New York, May 20 to June 2. At the time of the St. Louis convention last year, when the membership was 5,500, the registered attendance was 2,780. The membership has now crossed the 7,100 line and will not be less than 7,500 at the time of the annual convention, so that on the same basis there will be from 3,500 to 4,000 present in registered attendance. This implies heavy transportation and Mr. Hodskinson has therefore formed the following active committee, which is taking up its duties in co-operation with Mr. Hodskinson. By the middle of April practically all the details will have been arranged as to trips, rates, etc., and will then be announced. It is possible that other names may be added to the committee.

R. H. Ballard, Southern California Edison Company, Los Angeles, Cal.

W. J. Barker, Denver Gas & Electric Company, Denver, Col.

E. J. Bowers, Kansas City Electric Light Company, Kansas City, Mo.

J. A. Britton, Pacific Gas & Electric Company, San Francisco, Cal.

F. A. Coupal, Buffalo General Electric Company, Buffalo, N. Y.

E. Creed, Toronto Electric Light Company, Toronto, Canada.

J. E. Davidson, Pacific Power & Light Company, Portland, Ore.

P. Doty, St. Paul Gas Light Company, St. Paul, Minn.

J. B. Eaton, Rochester Railway & Light Company, Rochester, N. Y.

G. A. Freeman, Commonwealth Edison Company, Chicago, Ill.

F. H. Gale, General Electric Company, Schenectady, N. Y.

A. F. Giles, General Electric Company, Atlanta, Ga.

W. J. Grambs, Seattle Electric Company, Seattle, Wash.

M. S. Hart, Consumers' Electric Light & Power Company, New Orleans, La.

H. A. Holdredge, Omaha Electric Light & Power Company, Omaha, Neb.

H. M. Hope, Stone & Webster Corporation, Boston, Mass.

F. N. Jewett, Wagner Electric Manufacturing Company, St. Louis, Mo.

A. H. Manwaring, Philadelphia Electric Company, Philadelphia, Pa.

A. Maughan, Utah Light & Railway Company, Salt Lake City, Utah.

J. C. McQuiston, Westinghouse Bureau of Publicity, East Pittsburgh, Pa.

A. A. Serva, Fort Wayne Electric Works, Fort Wayne, Ind.

Chicago Electric Club.—Some interesting statistics relative to the operation, transportation facilities and engineering features of the Illinois tunnel system, which underlies the greater portion of the downtown business district of Chicago, were presented by W. E. Worth, superintendent of the company, in an address before the Chicago Electric Club on March 22.

The Illinois Tunnel Company's system comprises approximately sixty-two miles of track, which is all located in what is commonly termed the loop district of Chicago. Tracks are laid under practically every principal street in this district and the company has stations at many of the important buildings in the city.

One of the most important functions of the tunnel service is the re-

moval of excavations from buildings under construction. The speaker cited several instances in which all excavations for new caissons had been made under an old building before it had been torn down preparatory to rebuilding.

All excavated matter is transported to the company's disposal station alongside the Chicago River, where by means of electrically operated conveyors the earth is removed from the cars, raised to the water level and dumped into scows to be shipped and dumped into Lake Michigan.

Transportation of coal is another important feature of the company's service. The tunnel system is connected with a large number of power plants in its district to which it supplies coal and removes cinders. The cinders are disposed of in the same way as excavated material.

The transportation facilities as regards general freight were explained as being exceptionally good, the system being connected with every railroad entering Chicago, save one. There are four public receiving stations where freight is accepted for transportation to the railroad stations.

The tunnels are about 45 feet below the street level. The dimensions of the bore are 6 feet wide by 7 feet 6 inches high. The cars, which are made up into trains of ten cars, are 13 feet long by 4 feet wide. The motor cars now used for regular service are equipped with two twenty-five-horsepower motors. All current is purchased from the Commonwealth Edison Company and is supplied at 250 volts, direct current. The trolley system of operation is employed.

In reply to a question as to the ventilation Mr. Worth said that the system was equipped with eighty or ninety open-air shafts which furnish the requisite draft. The average temperature in the tunnels the year round is fifty-five degrees. Regarding switching Mr. Worth described the system employed, which is a combination automatic-electric method, invented by a member of the company.

Following the address brief remarks were made by W. N. Matthews, H. M. Wilson and V. Crawford.

National Conference on City Planning.—Plans have been completed for the national conference of the City Planning Association to be held in Philadelphia May 15, 16 and 17. President Taft and many widely known specialists in the line will attend. This will be the third meeting of the association. On Monday, the opening day of the convention, the delegates will be welcomed by Mayor Reyburn and the members of the local committee in charge. The first regular session will be called at 3 o'clock in the afternoon and the first paper will be read by Frederick C. Howe, embracing a discussion on German municipal real estate policies and the controversial topic of taxing the unearned increment of land. Mayor Reyburn's address of welcome will be replied to by Frederick Law Olmstead, president of the conference.

A number of interesting addresses are announced for the second session on Monday evening, when Ernest Flagg will talk on the "Proper Location of Public Buildings," and Frank Miles Day on the "Use of Parks for Buildings of Various Kinds." Mr. Day will tell of the attempts to erect buildings in Central Park, New York, and those in the parks of all cities in the

country for libraries, recreation buildings and bathhouses.

Among the speakers for other sessions are Lawrence Veiller, secretary of the National Housing Association; Lawson Purdy, president of the Department of Taxes and Assessments, New York; Professor Goodnow, of Columbia; Spencer Baldwin, of Boston University, and City Solicitor Alcorn. On Tuesday afternoon the delegates will be taken to the University of Pennsylvania on a tour of inspection, where a reception will be tendered by the trustees of the Archaeological Department.

One session will be devoted to a discussion of the link between water and rail transportation, and Wednesday morning's session will be presided over by Nelson P. Lewis, chief engineer of the Board of Estimate and Apportionment of New York City. Acting Director Haaskarl, of the Department of Wharves, Docks and Ferries, will read a paper. Equally interesting topics and speakers have been arranged for all the sessions, including John Nolen, of Cambridge, Mass.; George W. Tillson, chief engineer of the Borough of Manhattan; George S. Webster, chief engineer of the Philadelphia Bureau of Surveys; Walter L. Fisher, Secretary of the Interior; Assistant City Solicitor Andrew Wright Crawford, Ernest L. Heydecker, Frank B. Williams and Philip Kates.

American Society of Civil Engineers.

—At the next meeting to be held at the society house, on Wednesday, April 5, 1911, at 8.30 p. m., a paper entitled "The Going Value of Water Works," by Leonard Metcalf and John W. Alvord, member of the American Society of Civil Engineers, will be presented for discussion. This paper was printed in the "proceedings" for February, 1911. The usual collation, provided by subscription of resident members, will be served after the meeting. Chas. Warren Hunt, Secretary.

South Division Civic Association of Milwaukee.

—At a meeting March 23 the following officers were elected: First vice-president, Anton Lohr; second vice-president, A. P. Kunzelmann; third vice-president, Fred W. Reuter; fourth vice-president, W. J. Kroeger; secretary, George C. Nuesse. During the year the association has backed many improvements that have been put into effect. The following are claimed to be in whole or in part due to its activity: A high pressure water supply on the south side, creation of the office of tree warden, public comfort stations, agitation to clean up yards and houses, opening of the school halls to non-sectarian meetings, supplying of schools with trees and shrubs on Arbor Day, cross-town car line agitation, proposed Chicago & North-Western station, removal of poles and wires from National avenue, selection of the Fifth Ward Park after indecision for eight years, abatement of offensive Menomonee Valley smells, planning by the railroads for track elevation on the south side, rebuilding of Sixteenth street viaduct, greater privileges for children in Eighth Ward Park, bringing of track elevation experts to the city, abatement of the smoke nuisance in the Menomonee Valley.

Civic League, Petersburg, Va.—A committee has been appointed to look into the methods of garbage disposal in other cities.

Calendar of Meetings

- April 6-8.**
American Electrochemical Society.—Annual Meeting at New York City.—Secretary, Joseph W. Richards, Lehigh University, South Bethlehem, Pa.
- May.**
City Commission Congress.—Meeting. Galveston, Tex.—Mayor Lewis Fisher, Chairman of Committee, Galveston, Tex.
- May 11.**
Massachusetts Highway Association.—Quarterly Meeting in conjunction with the New England Conference on Street Cleaning, Springfield, Mass.
- May 15-17.**
National Conference on City Planning.—Philadelphia, Pa.—Flavel Shurtleff, Secretary, 19 Congress street, Boston, Mass.
- May 18-19.**
Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25.**
National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26.**
National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 29-June 2.**
National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14.**
National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-10.**
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.**
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.**
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June.**
New England Conference on Street Cleaning.—Springfield, Mass.—Corresponding Officer, Carol Aronovici, 55 Eddy street, Providence, R. I.
- June 11-16.**
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.**
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.**
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.**
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- August 15-18.**
Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 19-22.**
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.**
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.**
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6.**
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

PERSONALS

ARNOLD, W. C., Democratic candidate for Mayor of Weston, W. Va., was elected by a good majority.

COOMS, P. H., has been appointed City Engineer of Bangor, Me.

CREIGHTON, GEORGE, has been appointed Street Commissioner of Nyack, N. Y., succeeding Michael Crowley.

DEARBORN, G. W., has been elected Mayor of Amherst, Va., succeeding C. L. Scott, resigned.

GRAINGER, CHARLES F., of Louisville, who is president of the Board of Water Works, has been reappointed a member of the board by Mayor W. O. Head.

GREENE, L. O., Mayor of Albert Lea, Minn., was thrown from his automobile and sustained severe injuries. City Engineer Barneck was also thrown out and severely injured.

HALDEMAN, B. A., assistant engineer of the Comprehensive Plans Committee, read a paper before the Engineers' Club of Philadelphia on March 18 entitled "A Review of the Progress of City Planning."

HOLLIBAY, ALEX, Socialist candidate for Mayor of Two Harbors, Minn., was elected by an overwhelming majority.

HOPEMAN, A. M., has resigned as City Engineer of Fargo, N. D., to become President of the newly organized Hopeman Engineering & Construction Company.

HUGO, F. M., Mayor of Watertown, N. Y., gave a talk on Municipal Government before the Fortnightly Club of Oswego last week.

JONES, JOHN A., has been re-elected City Engineer of Lewiston, Me.

MACARTNEY, MORTON, has been reappointed City Engineer of Spokane, Wash.

MURPHY, M. D., has been appointed Street and Sewer Director of Wilmington, Del., succeeding John G. Gray, whose term expired.

NEWMAN, FRANK, has been appointed City Marshall of San Antonio, Tex., to succeed Charles T. Van Riper, deceased, who had been Chief of the Police Department for several years.

NISSLER, C. C., has been appointed City Engineer of Lewistown, Mont., succeeding O. F. Wasmansdorff, resigned.

RICKARDS, BURT R., formerly chief of Laboratories for the Ohio State Board of Health, has been appointed Associate Professor of Municipal and Sanitary Dairying at the Agricultural College of the University of Illinois.

SEESTED, HENRY M., has been appointed Inspector of Roads, Bridges and Culverts, Kansas City, Mo.

SHIELDS, BERNARD J., has been appointed Assistant Chief of the Fire Department of Albany, N. Y.

STANFORD, H. CLAY, has been elected Mayor of Kissimmee, Fla.

SWIFT, RODNEY, will serve again as engineer for Auburn, Me. At a recent meeting of the Water Commissioners Mr. F. E. Bisbee was elected Superintendent and Mr. L. L. Rand, Engineer.

TIMMONS, JOHN H., formerly of Niagara Falls, has been elected Mayor of the Village of Mayville, Chautauqua County, N. Y.

TURPIN, J. R. E., City Engineer of Rawlins, Wyo., and formerly Assistant Division Engineer of Utah division Union Pacific Railroad, and Lyman Eldridge, formerly Assistant Engineer with the N. Y. C. & H. R. R., have formed a partnership for the general practice of civil engineering, with offices in Hugus Building, Rawlins, Wyo.

TRADE NOTES

Cast Iron Pipe.—Chicago: Inquiries are quite numerous and prices remain firm. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: The volume of small orders is quite satisfactory. Higher asking prices than those last quoted have been named for the small sizes of water pipe. Quotations: 4 to 6-inch, \$23; 8 to 12-inch, \$22; over 12-inch, average, \$21. New York: Rather more activity is reported in purchases by private companies. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—Outside sellers of lead are doing a good business, and the buying movement extends all over the East. Contractors who use a large quantity of lead in conduit work have been buying large quantities. Quotations: New York, 4.45c; St. Louis, 4.30c.

Where Guessing Stops.—Under this caption the Knickerbocker Company, Jackson, Mich., manufacturers of the Coltrin concrete mixer, is sending out an attractive folder calling attention to the fact that to-day concrete work is exacting and that specifications must be closely followed. The advantages of a concrete mixer which regulates the proportions accurately and automatically are accordingly obvious.

Factory Location.—A company which proposes to erect an auto-sweeper plant, reported to be the Emerson Contracting Company, No. 1 Madison avenue, New York, is seeking a location for a factory to employ about 50 men in New Castle, Pa. The Board of Trade is endeavoring to facilitate the negotiations which contemplate the use of river front privileges which belong to the city. In addition to the frontage the company will purchase land to the value of about \$15,000.

Indian Road Oil.—One of the hand-somest brochures that has been received at the office of the MUNICIPAL JOURNAL AND ENGINEER for many a day is the souvenir of the Grand Prize Race over the Savannah course, Savannah, Ga., November 11-12, 1910, published by the Indian Refining Company, First National Bank Building, Cincinnati, O. The illustrations are of various scenes during the race; the decorations, Florida moss, Spanish bayonet and the like, give a local coloring. A letter from David Bruce Brown, winner of the Grand Prize, says in part: "This course is the finest in the world. The perfect condition of the road is largely due to the treatment of asphalt oil as furnished and applied by the Indian Refining Company, of Cincinnati, O., rendering it free from dust or any tendency to skidding. I think when you stop to consider the short space of time which was given to prepare the road for the practice and race, and the fine condition of the course when the race was ended it leaves no doubt as to the superiority of the Indian Refining Company's asphalt oil as a road preserver."

Value of Water Company.—Officers of the People's Water Company, Millville, N. J., have offered to sell their plant to the city for \$180,000. Some time ago the Water Commissioner fixed the price of the plant at \$222,500, but Council refused to purchase it at that figure. The plant was assessed by the city assessors last year at \$140,000, and from this amount the company appealed to the County Tax Board.

Auto Combination Fire Wagon.—A realistic exhibition of an auto combination hose and chemical wagon made by the Kelley Motor Truck Company, Springfield, O., was given last week in Gloucester, Mass. The machine had been driven from Cambridge, and happened to have its chemical tank charged. While waiting outside of the Dale avenue engine house for the arrival of councilmen who were to inspect it an alarm was sounded. Several firemen jumped in and were taken by Agent Fred A. Howard to the fire, which was on a shingle roof, and was being held in check by a bucket brigade. The chemical stream soon extinguished the fire. The machine weighs 6,800 pounds. It has a capacity of about 1,200 feet of fire hose and 200 feet of 3/4-inch chemical hose. The tank has a capacity of 40 gallons. It also carries two three-gallon hand extinguishers, one 24-foot compound extension ladder, one 10-foot single fire ladder. The engine is of 35-horsepower and can make a speed of about 40 miles an hour.

Unusual Delivery of Concrete Mixer.—The Standard Scale and Supply Company, Chicago, Ill., recently made a quick delivery of a concrete mixer under unusual circumstances. A customer at Gary, Ind., had a breakdown on their mixer, which was of another make, and it was of the utmost importance to have another mixer on the job the next morning. The subject was taken up with the railroad company, and they could not guarantee delivery by freight, and the mixer, which was mounted on truck and equipped with gasoline engine, was too large to conveniently load in express cars, so an automobile moving van was secured and the completed mounted outfit loaded on this van at 6 o'clock in the evening and the next morning at 8 o'clock it was delivered at Gary, Ind., about 30 miles from Chicago, complete and ready for operation. The mixer referred to has a capacity of about 100 yards per day, and because of the Eclipse simple construction it was possible to load the complete outfit without taking it apart, and the machine being of moderate weight, enabled the automobile to handle it without any difficulty even on the country roads.

Informal Bid.—The absence of a single word was responsible for the lowest bidder losing a contract for the laying of over 25,000 lineal feet of cement curb in the borough of Haddon Heights, N. J. W. Penn Corson and Albert D. Pine, both of Camden, were the lowest bidders, with Corson having a trifle the best of it. But when one of the members found that Pine had bid on "screened" gravel while the Corson bid was just for plain "gravel" it was unanimously voted to award the contract to Pine.

Cement and Clay Sewer Pipe.—The Sewer Committee of the Portland Ore., Council has recommended that an ordinance be ordered placed on the ballot at the next election providing for open competition between clay and cement sewer pipe on all sewer work. At present the specifications call for either one kind or the other.

Contractors' Plows.—The Syracuse Chilled Plow Company, Syracuse, N. Y., will add a six-story and basement brick and steel warehouse, 41 x 92 x 213 feet to its plant on Marcellus street. It will be connected with the main factory by an overhead bridge.

Cement Manufacture.—Under the caption From the Raw to the Finished Product, the Chicago Portland Cement Co., Chicago, Ill., has published a 68-page booklet describing the manufacture of Chicago AA Portland Cement. The mills are located at Oglesby, Ill. The whole process is described in an interesting way and handsomely illustrated. The various stages are: Stripping the soil; drilling; excavating, mixing and crushing raw materials; conveying the raw mix to the mill; automatic unloading; drying; grinding; burning; cooling the clinker; grinding, preliminary and final of clinker; weighing and sacking. Altogether it sounds like a good many processes to put a material through which sells for about a dollar and a half a barrel. At the end of the book are separate articles on a new reinforced concrete plant built of the Chicago AA cement; the power house of the cement plant and the installation of a 210-ton McCully crusher.

Blaw Forms.—The Blaw Collapsible Steel Centering Company, Pittsburg, Pa., have published a 150-page book on the Catskill Mountain Water Works for the Extension of the Water Supply of New York City. While intended largely to explain the use of Blaw collapsible forms in connection with this work, the book contains much valuable information and is worthy of a place in a library. A sketch of the history of New York water projects, particularly the various Croton works, occupy the opening pages. An account of the preliminary investigations for a new supply follows. Then are described in succession: The Catskill supply; the Ashokan reservoir; Kensico reservoir; Hill View reservoir; Catskill aqueduct, the cut and cover construction, with description of forms used; grade tunnels; pressure tunnels; tunnel forms; steel pipe siphons; construction camps and sanitary precautions; a list of contractors. A copy of the specifications under which all contracts are done concludes the book. Reproductions of a large number of valuable photographs, perhaps 50 or 75, showing construction work of all sorts and in all stages of progress, are included in the pages.

Canadian Cement Project.—The Associated Portland Cement Company, London, England, is said to be contemplating the establishment of a number of plants in Canada at points scattered from the Atlantic to the Pacific. This would involve the expenditure of millions of dollars in construction.

Pipe Covering.—A company has been organized at Grand Rapids, Mich., to make an improved pipe covering. The principals are Glendon A. Richards and I. H. Wilson.

Pneumatic Service.—The Ohio Mail and Parcel Transportation Company, Cincinnati, O., operating under patents of the American Pneumatic Service Company, Boston, Mass., has applied to the City Council of Cincinnati for a right of way for a pneumatic tube through the streets of the city from the post office to the Grand Central depot. The tube is to be 30 inches in diameter, the largest hitherto ever used being only 8 inches.

Auto Fire Apparatus.—The Robinson Fire Apparatus Company has purchased the corner of Twentieth and Ferry streets for \$30,000. The company manufactures automobile fire engines, and it is understood will enlarge its present quarters on the site.

Concrete Company.—The Hopeman Engineering and Construction Company, Moorehead, Minn., has been organized to take over the business of the late J. V. Godfrey. A. M. Hopeman, formerly City Engineer, is president and manager.

Water Company's Report.—The forty-fifth annual report of the Annapolis Water Company was recently made by President Harry J. Hopkins. The receipts for the year were \$27,343.54 and the disbursements \$20,176.39. The year just closed was remarkable on account of the severe drought which exhausted the reserve in the storage reservoir of 16,000,000 gallons. With a view to averting a recurrence of this condition James H. Harlow, consulting engineer, has been engaged to make recommendations regarding the enlargement of the reservoir and the diversion into the reservoir of a nearby stream.

Crushing Plant.—The Michigan Limestone and Chemical Company, Calcite, Mich., will build a large stone crushing plant this spring. Work will commence this week on the excavations.

Contractors Ahead of Schedule.—The Guild Contracting Company, Chattanooga, Tenn., which is constructing an extensive sewerage system in Charleston, S. C., will complete the pipe laying and pavement repair in about three months, according to City Engineer J. H. Dingle. The company also has the contract for the pump wells and also an outfall sewer, so that they will be at work in Charleston for a much longer time.

Steam Roller.—The Iles Contracting Company, Louisville, Ky., has been incorporated with \$3,000 capital stock by Charles Stilger and others. A steam roller is about the most important item of equipment to be purchased.

Police Signal System.—A factory for the manufacture of a modern police signal system, including a semaphore and red light for the calling of policemen; also a checking system for policemen when they report at regular intervals, may be established in Salt Lake, Utah, in the near future. At police headquarters, Salt Lake, a demonstration was recently made of the new system before prominent members of the city government and police officials. The new system was recently perfected in Salt Lake by Earl J. Kingsley, the inventor.

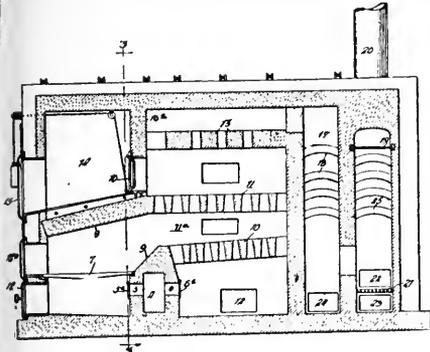

Enlarge Plant.—The pay roll of the James B. Clow & Sons plant at Coshocton, Ohio, shows an enrollment of 251 men, many of whom are high-salaried employees. For the month of January the company paid \$10,600 in wages, and for the month of February \$11,000. The hydroelectric power which will operate the plant was turned on last week. The plant will double its capacity, working a double shift, giving employment to twice the present number of men, making a total of 500. As fast as possible machinery will be added and other improvements made until the company employs the promised number 1,000 men. According to President Himebaugh this date is not in the remote future. Water pipe is one of the principal products of the concern.

Seagrave Auto Apparatus.—The following contracts have been recently received by the Seagrave Company for auto apparatus: Five pieces for Los Angeles, Cal.; 2 for Rockford, Ill.; 1 for Waukegan, Ill.; 1 for Shreveport, La.

PATENT CLAIMS

986,853. MANURE AND GARBAGE INCINERATOR. Gerhardt J. Patitz and Cornelius Sippel, Chicago, Ill., assignor to Kaestner & Co., a Corporation of Illinois. Serial No. 492,401.

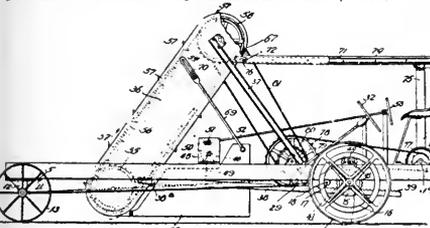

In an incinerator, the combination of a drying chamber and a combustion chamber, having a wall therebetween, a fire chamber below the drying chamber communicating with the combustion chamber, said combustion chamber having an auxiliary grate surface forming the bottom thereof, and an arch forming the top there-

of, said arch having restricted openings in the center thereof, and a relatively enlarged opening at the end thereof, adjacent the wall between the drying chamber and combustion chamber, whereby a ready outlet for the heated gases passing from the combustion chamber is provided adjacent the wall between the combustion chamber and drying chamber, substantially as described.

987,249. DITCHING-MACHINE. Henry Matthies, Chicago, Ill. Serial No. 571,271.

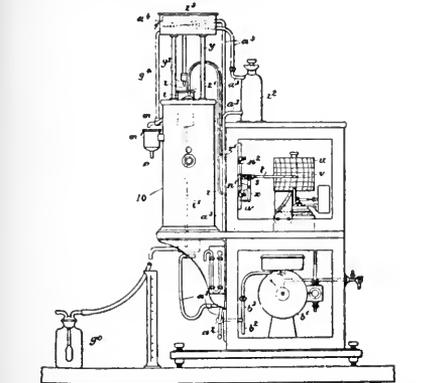

In a ditching machine, excavating elements comprising an endless chain, means for imparting travel thereto, a series of plates mounted upon said chain, shovels

pivotaly mounted at intervals upon said plates, said shovels each comprising a blade and a bifurcated base extending rearwardly from the blade, and a pair of opposed excavating knives mounted upon each side of the shovel.

987,537. RECORDING GAS-CALORIMETER. Clifford Howell Beasley and Fredric George Beasley, Smethwick, near Birmingham, and Richard Henry Bradbury, Oldbury, England, assignors of one-fourth to Parkinson and W. & B. Cowan, Limited, Birmingham, England. Serial No. 555,518.

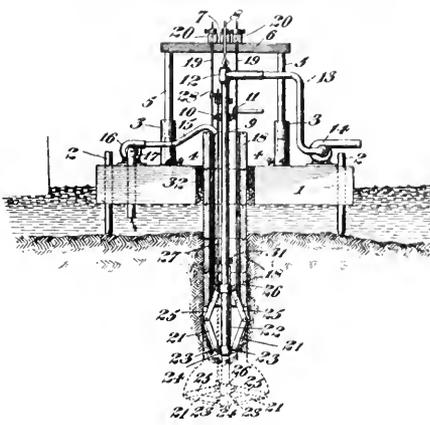

In a gas calorimeter, in combination, a burner, a closed shaft inclosing the burner, a burner connection which passes through the shaft, the latter having a combustion chamber in which the burner is arranged,

water heating tubes through which the products of combustion are forced upon said chamber, and means for supplying air and gas under pressure considerably greater than atmospheric pressure to the burner, the air and gas thus supplied serving to force the products of combustion through said tubes.

987,266. FOUNDATION APPARATUS. Stewart K. Smith, Vintondale, Pa. Serial No. 595,177.

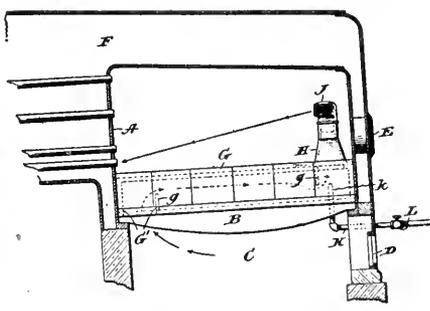

In apparatus of the character described, an expansible cutting tool adjustably

mounted on a hollow shaft, means for revolving the same, and suction or pumping devices connected with said hollow shaft for receiving the excavated material there-through.

987,316. METHOD OF PROMOTING COMBUSTION. John H. Parsons, Ridley Park, Pa., assignor to Parsons Engineering Company, Wilmington, Del., a Corporation of Delaware. Serial No. 556,426. Renewed Oct. 26, 1910. Serial No. 589,262.

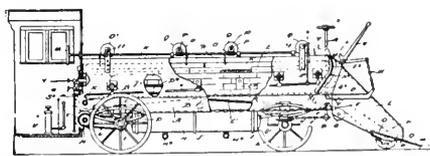

The art of promoting combustion in furnaces consisting in igniting a body of fuel supported on a grate, supplying air below the ignited body of fuel, introducing above said body of fuel heated air in the general direction of the draft of the furnace and in

such volume as to oxidize the combustible gases and consume the carbon particles arising from the body of fuel, the volume and velocity of the introduced air being such as to cause an entraining action on the air passing through the bed of fuel whereby the amount of air passing through the bed of fuel is regulated by the regulation of the volume and velocity of the air introduced above the fuel.

987,343. ROAD-MACHINE FOR MELTING SNOW. Clem M. Brooker, Lakewood, Ohio. Serial No. 563,684.

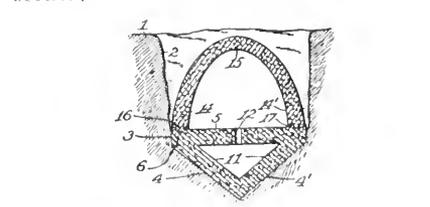

In a snow melting machine, the combination of a fire box, a conveyer traveling

within the fire box, and means to feed snow onto the conveyer by forward movement of the machine.

987,398. SEWER CONSTRUCTION. Joseph L. Potter, Indianapolis, Ind. Serial No. 587,525.

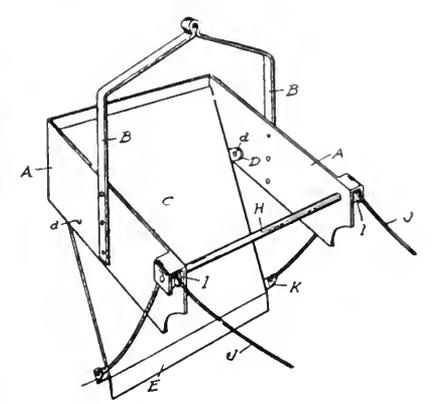

A sewer comprising base sections having each a triangular external contour in cross-section, the sections having flat tops and

joined together, and main sections upon the flat tops of the base sections and joined together, the main sections extending across the joints between the base sections.

987,352. APPARATUS FOR EXCAVATING AND TRANSPORTING SOIL AND SIMILAR SUBSTANCES. George E. Field, Comstock, N. Y., assignor of one-half to Atlantic, Gulf and Pacific Company, a Corporation of West Virginia. Serial No. 453,199.

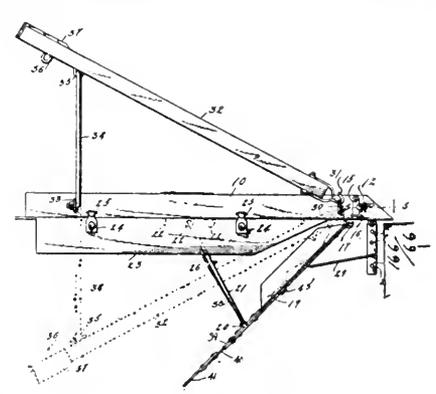

A bucket provided at its front end with a securing device, and at its rear end with

two pulleys arranged at an angle to the horizontal axis of the body-portion of the bucket, and separated sufficiently to permit a cable to pass between the same.

987,476. DITCHING AND GRADING MACHINE. John D. Martin, Owensboro, Ky. Serial No. 597,498.

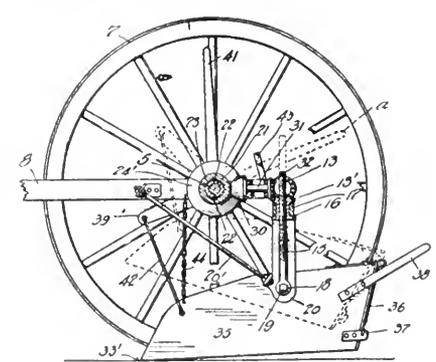

A machine of the class described, comprising a beam, a scraper blade hinged to the forward end of the beam, means for securing said scraper blade in different angular adjustments with respect to the

beam, an arm swingingly mounted on said beam for movement from one side thereof to the other, and an earth engaging blade carried by said arm adapted to be actively disposed when the arm is moved to a position on the opposite side of the beam from the scraper blade.

987,621. SELF-LOADING CART. Norman L. Goodwin, Tacoma, Wash. Serial No. 569,215.

In apparatus of the class described, the combination with an axle, a frame secured to the axle and wheels journaled upon the axle ends, vertically movable rods, a scraper tiltably connected to said rods, mechanical connections between one of said

wheels and said rods for effecting the raising and lowering of the rods with corresponding movements of the scraper, and means for tilting the forward end of the scraper downwardly for loading purposes and upwardly to enable the load to be discharged from the rear end of the scraper.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
BRIDGES				
Pennsylvania	Pittsburg	Apr. 7, 10 a.m.	Constructing reinforced concrete arch bridge	Jos. G. Armstrong, Dir. Pub. Wks.
Indiana	Fort Wayne	Apr. 8, 10 a.m.	Constructing a steel bridge over the Maumee river, also demolishing two old steel bridges and concrete abutments and one culvert, also forming the concrete bridge piers and one culvert, also forming the concrete bridge piers	Calvin H. Brown, County Auditor; John T. Scott, Asst. Knox Co.
Indiana	Vincennes	Apr. 8, 10 a.m.	Constructing 3 bridges in Knox County	Calvin H. Brown, County Auditor; John T. Scott, Asst. Knox Co.
New Jersey	Camden	Apr. 10, 11 a.m.	Constructing culvert over Bates' Mill Stream, alternate build wooden bridge at same place	Frederick W. Gereke, Chm. Bridge Com. Frank M. Halcomb, County Clerk. Board of Co. Comrs.
Kansas	Kansas City	Apr. 10	Repairing 5th St. Bridge over Kansas river	Board of Co. Comrs.
Ohio	Nenia	Apr. 12, 11:30 a.m.	Con. superstructure & appurtenances of the Louis Hill Bridge	Commissioners Licking County
Ohio	Newark	Apr. 12	Constructing various bridges in Licking County	Board of Co. Comrs.
Pennsylvania	Chambersburg	Apr. 14, 11 a.m.	Erecting reinforced concrete bridge over Mill & Run	E. K. Radt, Ck. County Comrs.
Indiana	Decatur	Apr. 14	Constructing the Abe Reley bridge	Board of Co. Comrs.
Oregon	Portland	Apr. 14, 2 p.m.	Constructing West Burnside Bridge	S. P. Fielis, County Clerk
Wisconsin	Kenosha	Apr. 15, 4 p.m.	Rebuilding and altering Main St. Bridge	R. H. Mohr, City Engr.
Kansas	Lawrence	Apr. 15, noon	Constructing 2 stone abutments on 1st St. earlier span	W. R. Green, County Clerk.
Idaho	Moscow	Apr. 15, noon	Constructing bridge across Parula Creek	Homer E. Estes, Ck. Bz. Co. Comrs.
New Mexico	Las Vegas	Apr. 17	Constructing 3 bridges	Lorenzo Delaigo, Probate Clerk.
Ohio	Warren	Apr. 17, 1 p.m.	Construct concrete bridge over Little Snyva Creek, Liberty twp.	Frederick T. Stone, County Auditor.
Kentucky	Paducah	Apr. 17	Constructing a reinforced concrete bridge over the Ohio river	L. A. Washington, City Engr.
Ohio	Niles	Apr. 17, 1 p.m.	Constructing concrete bridge over Little Snyva Creek, Liberty twp.	Frederick T. Stone, County Auditor.
Pennsylvania	Wilkes Barre	Apr. 18, 2 p.m.	Constructing sixty bridges	James M. Norris, County Comp.
Pennsylvania	Easton	Apr. 18	Constructing a reinforced concrete bridge	Comrs. Northampton County.
Illinois	Aurora	Apr. 20, 2 p.m.	Constructing a new bridge	City Clerk.
Illinois	E. St. Louis	Apr. 25	Constructing 3 iron bridges in Madison County	H. D. Sexton, Pres. Bd. Trustees.

LIGHTING AND POWER

Omaha	Fort Nebraska	Apr. 10, 11 a.m.	Constructing an extension of the electric lighting system at Fort Omaha	Capt. W. L. Clarke, Con. Q. M. U. S. A. W. P. Heal, City Clerk
Sask. Can.	Moose Jaw	Apr. 10, 8:30 p.m.	Furn. 2 electrically driven central pumps and auto starters	
Nebraska	Omaha	Apr. 11, 8 p.m.	Lighting streets with incandescent street lamps, three years including extinguishing, cleaning, repairing and maintaining and painting posts once a year	Dan B. Butler, City Clerk. Roy J. McQueen, Supt. Lamps & Lt.
Maryland	Baltimore	Apr. 12, 11 a.m.	Supplying ornamental lamp posts	
Alabama	Troy	Apr. 17	Furn. 1 stationary steam engine 400 H.P., 150 lbs. initial pressure; 1 electric generator, 250 kva., 60 cycles 3-phase, 2,300 volts; 1 pump, electrically driven capacity not less than 300 gals. per minute against 100 lbs. working pressure; 1 motor to drive pump; transmission line material for 3-phase line 3 1/2 miles long, size of wire No. 4 B&S.	A. B. Campbell, Supt. E. & W. Dept. Magnus Peterson, Secy. Civic B. Con.
Manitoba, Can.	Winnipeg	May 1, 11 a.m.	Furnishing ornamental lighting standards	

FIRE EQUIPMENT

Y.—Widening 23d st. from 2d ave. to 8th ave., for repaving roadway as widened, as well as the present roadway between 8th ave. and 10th ave., all with wood block pavement: (a) Republic Contracting Co., 18 Broadway, (b) U. S. Wood Preserving Co., 165 Broadway: 23,460 sq. yds. wood block pavement, including sand cushion, except the railroad area. (a) \$3.87, (b) \$2.73; 3,030 sq. yds. wood block pavement, including sand cushion in the railroad area, no guarantee. (a) \$3.87, (b) \$2.73; 100 sq. yds. sheet asphalt pavement, including binder course, (a) \$2.50, (b) \$1.90; 5,100 cu. yds. Portland cement concrete. (a) 1c., (b) \$5.85; 11,120 lin. ft. new blue-stone curbs, (a) 80c., (b) \$1; 2,000 lin. ft. old blue-stone curbs, reset, (a) 80c., (b) 40c.; 300 lin. ft. platform flags, to be cut to line, (a) \$1, (b) \$1.25; 660 lin. ft. new header stone, (a) 35c., (b) 45c.; 400 cu. yds. fill, (a) 1c., (b) 5c.; 40 noiseless heads and covers, complete, for sewer manholes, furnished and set, (a) \$15, (b) \$15.50; 10 new corner catch basins, (a) \$250, (b) \$250; 3 corner catch basins, (a) \$250, (b) \$200; 3 side catch basins, (a) \$250, (b) \$200; totals, (a) \$118,448, (b) \$119,275; regulating and repaving with wood block pavement on concrete foundation 2d ave. from 74th st. to 83d st., Republic Contracting Co., 18 Broadway, 11,350 sq. yds. wood block pavement, including sand cushion, except the railroad, \$3.45; 1,060 sq. yds. wood block pavement, including sand cushion in the railroad area, no guarantee, \$3.45; 2,200 cu. yds. Portland cement concrete, 1c.; 2,300 lin. ft. new blue-stone curb, 85c.; 2,000 lin. ft. old blue-stone curb, reset, 35c.; 13 noiseless heads and covers, complete, for sewer manholes, furnished and set, \$15; 470 lin. ft. of header stone, 35c.; total, \$45,851.90; regulating, grading, curbing, flagging, etc., Bennett ave., extending from W. 181st st. to Broadway, opposite Nagle ave., Marrone Contracting Co., 357 E. 116th st., 9,400 cu. yds. earth excavation, \$2.40; 7,500 cu. yds. solid rock excavation, \$1.45; 1,700 cu. yds. loose rock excavation, 1c.; 6,000 cu. yds. filling, to furnish, exclusive of that secured from excavation, \$1.35; 1,800 cu. yds. dry rubble wall, to take down, 50c.; 1,000 cu. yds. dry rubble masonry for retaining wall and culverts, \$1; 50 cu. yds. concrete for foundations, \$1; 3,300 lin. ft. of guard rail, 15c.; 7,500 lin. ft. new curb, 50c.; 28,600 sq. ft. new flagging, \$2; 2,600 sq. ft. new bridgestone, 72c.; 35 sq. yds. granite pavement, 24c.; total, \$32,971.

Utica, N. Y.—Paving: Canal st., Breese

st., to Schuyler st., Barber Asphalt Paving Co., with asphalt, \$8,741.12; H. P. Burgard Co., Buffalo, asphalt, \$9,754.75; Fay st., Lafayette st., to Columbia st., Barber Asphalt Paving Co., asphalt with artificial curb, \$2,616.30; with natural curb, \$2,763.80; H. P. Burgard Co., asphalt with artificial curb, \$2,833.25; with natural curb, \$3,066.35; Barber Asphalt Paving Co., railroad strip with brick \$944.20; Hammond sandstone, \$1,212; H. P. Burgard Co., railroad strip with brick, \$910, Hammond sandstone, \$1,170; Root st., Catherine st. to Erie Canal, Barber Asphalt Paving Co., asphalt, \$1,320.30; H. P. Burgard Co., asphalt, \$1,463.15; John R. Baxter, Jr., with Shawmut brick, \$1,518.35; J. W. Johnston, Shawmut, Mack or Corning brick, \$1,440.10; Metropolitan block, \$1,484.10; N. D. Peters, Shawmut or Corning bricks, \$1,469.50, Hammond sandstone blocks, \$1,887.50; Wurz ave., Miller road to North Genesee st., Barber Asphalt Paving Co., asphalt, with artificial curb, \$15,216.10, with natural curb, \$16,298.60; H. P. Burgard Co., asphalt with artificial curb, \$17,105.30, natural curb, \$18,271.40; John R. Baxter, Jr., Shawmut brick and artificial curb, \$17,007.80; natural curb, \$17,787.20, Hammond sandstone and natural curb, \$22,749.40; J. W. Johnston, Shawmut, Mack or Corning brick and artificial curb, \$16,774.-0, with natural curb, \$17,770, Metropolitan block and artificial curb, \$17,351.10; natural curb, \$18,347.10; N. D. Peters, Shawmut or Corning brick and artificial curb, \$17,048, natural curb, \$18,130.50; Hammond sandstone and natural curb, \$23,612.

Youngstown, O.—Bettie ave. grading, J. McGraw, \$943.30; J. Cumisky, \$1,018; E. J. Kane, \$1,032; Miller Bros., \$1,075.50; J. McCarron, \$1,160.50; Kennedy Bros., \$1,124.50; S. H. DeGroot, \$1,249.50; Anthony O'Haro, \$1,139; M. P. Connelly, \$1,481; J. P. Morrison, \$1,640; William Hynes, \$2,035.

Youngstown, O.—Paving streets: Oak St., Watt St. and Truesdale Ave., Anthony O'Horo, \$27,441.50; H. P. Connelly, \$28,200; Turner & Olson, \$28,439; J. McGraw, \$28,667.30; Kennedy Bros., \$29,060.60; William Hynes, \$29,170; Mullin & Quinn, \$29,284.60; W. E. Gartland, \$29,298; James McCarron, \$29,352.40; P. F. Farragher, \$29,395.30; A. Colucci, \$29,401.80; H. A. Miller, \$29,429.90; Chambers & Heasley, \$29,755.50; E. J. Kane, \$29,777.50; Miller Bros., \$29,987.90; J. P. Morrison, \$29,918.80; J. Comiskey, \$30,149; Youngstown Construction Co., \$30,653.20; Logan Ave., Broadway and city limits, S. H. DeGroot, \$35,766.30; M. P. Connelly, \$35,901; W. E. Gartland, \$35,995.50; A. Colucci, \$36,230.20; Chambers & Heasley, \$36,419.50; Kennedy Bros., \$36,420.50; Turner & Olson, \$36,467; Youngstown Construction Co., \$36,651.50; James McCarron, \$36,701.50; Miller Bros., \$37,048; J. Comiskey, \$37,423; P. F. Farragher, \$37,491; H. A. Miller, \$37,632.50; William Hynes, \$37,818; Mullin & Quinn, \$37,917.50; J. McGraw, \$37,954.40; J. P. Morrison, \$38,810; Duquesne St., Edwards St. and Greenwood Ave., P. F. Farragher, \$6,872.40; Kennedy Bros., \$6,783.50; J. P. Morrison, \$7,064.50; M. P. Connelly, \$6,837.50; Turner & Olson, \$6,752.70; S. H. DeGroot, \$6,682.20; J. McGraw, \$7,152.20; James McCarron, \$6,819.50; Chambers & Heasley, \$6,897.80; William Hynes, \$6,900.50; Youngstown Construction Co., \$6,626.10; J. Comiskey, \$6,946; H. A. Miller, \$7,007.70; Mullin & Quinn, \$5,637.50; W. E. Gartland, \$7,157; J. Colucci, \$6,568; Miller Bros., \$6,595.30; Bread-street, Market and Hillman, Mullin & Quinn, \$10,522.75; W. E. Gartland, \$11,177.90; A. Colucci, \$10,936.15; Youngstown Construction Co., \$10,610.50; J. Comiskey, \$11,235.50; E. J. Kane, \$10,752; H. A. Miller, \$11,510.50; J. McGraw, \$10,922; James McCarron, \$10,871.75; Chambers & Heasley, \$11,165.95; William Hynes, \$11,281.50; M. P. Connelly, \$11,274.80; Miller Bros., \$10,494.15; S. H. DeGroot, \$10,481; J. P. Morrison, \$11,186; Kennedy Bros., \$10,825.80; P. F. Farragher, \$11,009.71; Superior St., Federal and Delaware, S. H. DeGroot, \$12,574; J. P. Morrison, \$13,236.50; Kennedy Bros., \$13,690.30; P. F. Farragher, \$13,674.70; J. McGraw, \$13,647.70; James McCarron, \$13,036.90; Chambers & Heasley, \$14,074.50; William Hynes, \$12,771.20; M. P. Connelly, \$13,364.20; Turner & Olson, \$13,635.50; Youngstown Construction Co., \$13,911.30; A. Colucci, \$12,658; E. J. Kane, \$13,637.50; H. A. Miller, \$13,071.10; Mullin & Quinn, \$13,072; W. E. Gartland, \$14,528.50; J. Comiskey, \$13,470; Miller Bros., \$13,747.90.

Beaumont, Tex.—Paving Pearl, Main, Milam and other streets: Davis Bros. of Houston, \$2.77 per sq. yd. for wood blocks; James Wellman, bitulithic, \$2; brick, \$2.80; wooden blocks, \$2.88; the Eureka Construction Co., of Tulsa, Okla., bitulithic, \$2; brick, \$2.59; asphalt, \$2.12 wooden blocks, \$2.83; Creosote Wood Block Construction Co., Gulfport, Miss., \$2.70 for creosoted wooden blocks.

Galveston, Tex.—Grading and shelling Lamarque-Texas City road, 1-1.3 miles, W. D. Haden, excavating 17c., embankment 17c., creosoted lumber \$65, pine lumber \$27,

Burlington, Wis.—Bids received Mar. 24 for brick and cement paving, cement curb and gutter; 5,460 cu. yds. of excavation is included in price bid for paving; sand-gravel-crushed stone cost 75c. per su. yd. delivered on streets; contract awarded to Fred Eul, Menasha, \$21,922.15; bid included \$118.10 for retaining curb.

Contractor.	12,645 square yards of cement pavement, 5-inch concrete base.	2,240 square yards of brick pavement, 6-inch concrete base.	5,875 lineal feet of com. curb and gutter 2-ft. gutter.	5,970 lineal feet of cement curb.
1 R. R. Birdsall, Racine, Wis.	\$1.12	\$1.70	\$0.60	\$0.40
2 Jno. Brogan, Green Bay, Wis.	1.23	2.02	.48	.33
3 J. Rasmussen & Sons, Oshkosh, Wis.	1.23 1/2	1.87	.48	.37
4 Western Improvement Co., Racine, Wis.	1.34	1.99	.58	.44
5 N. F. Reichert, Racine, Wis.	1.17	1.66	.53	.40

11 McGrath Construction Co., Green Bay, Wis.	1.26	1.83	.49	.29

Building retaining wall, to Fred Eul, \$1,710; other bidders: Jno. Brogan, \$2,600; Chris. Peterson, \$1,710, and G. M. Agner, Burlington, \$2,280.—P. J. Hurltgen, City Engineer.

excavating culverts 35c., mudshell \$1.98; F. Freund, excavating 15c., embankment 16c., creosote lumber \$65, pine lumber \$35, excavating culverts 17½c., shell \$1.87½c.; Han-son & Sons, excavating 16c., embankment 17½c., creosote lumber \$67, pine lumber \$38, excavating culverts 18½c., shell \$1.89½c.; Suderman & Dolson, excavating 15c., embankment 15c., creosote lumber \$60, pine lumber \$50; excavating culverts 25c., shell \$1.61; J. C. Kelso, excavating 16c., embankment 16c., creosote lumber \$60, pine lumber \$30, shell \$1.94.

Everett, Wash.—Construction of three and a half miles of road between Gold Bar and Index, two sections: For both sections lowest bid was submitted by Ferch & Goss, \$23,168.46; firm will get the work. The bids submitted are as follows: Section D, two miles, A. C. Goerig, \$13,186; Cross, Chadbourne & Rollens, \$12,857; Charles Daley & Co., \$13,607.80; Yost & Waddle, \$22,643.82; American Pile Driving Co., \$15,722; A. R. Swanson, \$17,691.10; Section E, one and one-half miles, A. C. Goerig, \$14,313; Cross, Chadbourne & Rollens, \$12,606; Ferch & Goss, \$12,800.42; Yost & Waddle, \$16,710.76; American Pile Driving Co., \$13,151.

Fort Monroe, Va.—Constructing concrete walks, macadam roads, etc.: R. H. Richardson, Hampton, Va., concrete walks, 13c. per sq. ft.; macadam roads, 98½c. per sq. yd.; catch basins, \$14.39 each; tile drains, 6-in. laid, 22c. per lin. ft.; J. H. Brinson, Hampton, on same items, 12½c., 90c., \$10, 18c.

Fond du Lac, Wis.—Total bid of the John Rasmussen & Sons Co., Oshkosh, for paving 6th st., Main to Fond du Lac ave., with reinforced cement amounts to \$17,792.50; G. H. Stanchfield, city, bid \$17,884.05; John Brogan, Green Bay, \$18,167; McCugo-Bullock Co., city, \$18,272.30, and Christ. Johnson, Oshkosh, \$20,042.10.

Wausau, Wis.—Paving 3d st., (a) with creosote blocks, (b) with vit. brick, price given per sq. yd.: C. Johnson, (a) \$2.53, (b) \$2.36; Advance Construction Co., (a) \$2.71, (b) \$2.42; McGrath Construction Co., (a) \$2.75, (b) \$2.45.

SEWERAGE

Denver, Col.—City proposes to construct lateral sewer in a portion of Sub-District No. 3 at a cost of \$122,319.—J. B. Hunter, City Engineer.

Bradentown, Fla.—Citizens are urging bond issue for extending sewer and water system.

West Palm Beach, Fla.—Citizens will vote May 2, extension of time, on \$16,000 bonds for extension of sewer system.

Barnesville, Ga.—Citizens will vote April 18 on \$50,000 bonds for extension of sewer system, etc.

East St. Louis, Ill.—Board of Local Improvements has passed resolution for formation of sewer drainage district and construction of system of sewers at total cost of \$280,000.—Silas Cook, Mayor; W. J. Crocken, City Engineer.

Anderson, Ind.—Plans are being prepared for 8-ft. sewer from center of city, 14 miles south, including dredging of Green Branch Creek; estimated cost, \$100,000.

Indianapolis, Ind.—Board of Public Works has confirmed resolution for sewer system in Jackson Park; cost \$81,600.

Clinton, Ia.—Council intends to repeal all former resolutions and notices in regard to construction of completion of sewer in Sewer District No. 46 and will not take bids on April 4 as contemplated; new bids will be taken about May 2.—K. C. Hart, City Engineer.

Humboldt, Kan.—Council has passed ordinance creating sewer district and calling for construction of such improvements costing about \$20,000.

Jonesville, Mich.—Council has passed resolution to construct sewer along the principal business portion of Chicago st.; total cost not to exceed \$1,540.

Gilbert, Minn.—Village Board is planning to install sewers at cost of over \$30,000.

Chatham, N. J.—Councils of Madison and Chatham have received report from the engineers in charge of joint sewer construction favoring the building of a siphon through Chatham rather than a gravity conduit, portions of which would have to be elevated; additional cost, which will be borne entirely by Madison, will be in neighborhood of \$12,120; report is binding upon towns.

Monmouth Beach, N. J.—Council has decided to install modern sewerage system in near future.—J. P. Manahan, Mayor.

Ocean City, N. J.—Committee from the Board of Trade has reported in favor of \$75,000 bond issue for an adequate and permanent system of surface drainage.

Sparks, Nev.—Council is considering calling election on \$25,000 bonds to construct sewers.

Dunn, N. C.—City has selected White & Platt, Durham, to prepare plans for sewerage.

Red Springs, N. C.—City has selected White & Platt, Durham, as engineers in charge of construction of sewer system; surveys are completed.

Coshocton, O.—City has sold \$12,400 sewer and paving bonds to H. D. Beach & Co.

Grand, O.—Engineer Wilson has estimated cost of storm sewer on State st. at \$6,000 and on Liberty st., \$4,000.

Marysville, O.—J. A. Kimmier, Columbus, will prepare plans for installation of proposed sewerage system.

Niles, O.—Council has authorized Board of Control to ask for bids for construction of sewage disposal plant to cost \$75,000.

Stuebenville, O.—Bids will be received about May 1 for constructing sewers in Stony Hollow road; cost \$14,000.—J. N. Fuch, Engineer.

Lebanon, Pa.—Bids will be received about May 1 for building sewage disposal plant to cost about \$120,000.—W. Crowell, City Engineer.

New Castle, Pa.—Council is considering issuance of \$47,000 bonds for sewer and street improvements.

Blacksburg, Va.—City is considering laying out 3.5 miles 6-in. and 8-in. sewer pipe.—F. W. Eheart, Mayor.

Lusk, Wyo.—Bids will be received April 17 for \$14,000 sewer bonds.

Regina, Sask., Can.—Citizens have passed \$18,000 by-law for sewerage.

CONTRACTS AWARDED

Ft. Logan, Col.—To National Construction Co., Denver, by the Quartermaster's Department, for construction of a sewage disposal system, \$29,030.

West Dundee, Ill.—Construction of sewer system from plans of J. W. Miller, Elgin, to E. Scheffler, Gary, Ind.

Bridgeton, N. J.—Completion of sewage disposal plant, to T. J. McGovern, Trenton, N. J., \$20,770; other bidders: Hard & Worm, \$22,364.50; Bond & McAlley, \$22,826; Barber & Perrin, \$23,443.20; J. W. Heller, \$23,489; B. F. Sweeten & Son, \$25,682.25.—Clyde Potts, New York City, Engineer in Charge; J. B. Jones, City Clerk.

Lestershire, N. Y.—Building East Main st. sewer extension, to Contractor Serafina, Binghamton, \$1,099.

Niagara Falls, N. Y.—Building tunnel trunk sewer in Lafayette ave., to Read-Coddington, \$45,000.

Rochester, N. Y.—Building sewer on Frank st., to Hagaman, Miller & Hagaman, \$5,787.25.

Cincinnati, O.—By Service Director Sundmaker, sewer Rittenhouse st., to M. F. Quill, \$999.80; Potomac ave. and adjacent streets, to Charles L. Wright, \$8,543.80; West 8th st., to Connelly Construction Co., \$7,353.50.

Dayton, O.—Construction of number of sewer extensions: Edmund st. sewer, to Hecker & Kirchner; Johnson and Morton sts., to John F. Cook; Hart st., to Hecker & Kirchner; Phillips ave., to Shafer & Dill; Orchard ave., to A. J. Kammer; Bickham st., to Shafer & Dill.

Grandview Heights, O.—Furnishing labor and materials necessary to construct sewer with outlet outside of the corporate limits: John C. Beasley, Columbus, \$18,797; Joseph Westwater Co., Columbus, \$23,252; C. I. McCrocken & Co., Columbus, \$19,507.

Newberg, Ore.—To T. S. Shepperd, Portland, for constructing sewer system, \$75,940.

Chester, Pa.—Furnishing 35 No. 1 inlets, to Edmund Butler, as follows: Open mouth, \$87; grate top inlets, \$87.

Rochester, Pa.—Sewering part of Jefferson and Enon sts., to Contractor J. L. Conner, Freedom.

Burlington, Wis.—Building sewers, to C. E. Reed, city, 1,258 ft. 15-in. vit. pipe, 45c.; 938 ft. 12-in. 34c.; 518 ft. 10-in. 28c.; 290 ft. 8-in. 25c.; 7 manholes, \$23 each; 18 10-in. ¼-bent, \$3 each; total bid, \$1,109.96; totals of other bidders: Fred Eul, Manasha, \$1,308.18; Johnson & Thompson, Racine, \$1,213.48; N. F. Reichert, Racine, \$1,335.10; Jas. McCabe, Fond du Lac, \$1,151.45; J. Rasmussen & Sons, Oshkosh, \$1,757.20; McGrath Construction Co., Green Bay, \$1,908.20; John Brogan, Green Bay, \$1,547.32; the Swanson Co., Chicago, \$1,710.60.—F. J. Hurtigan, City Engineer.

BIDS RECEIVED

Wheaton, Ill.—Bids received March 23 for sewer extension: (a) Radcliffe Plumbing & Heating Co., city, (b) the Swanson Co., 834 N. Clark st., Chicago, (c) Chas. M. Porter Co., 702 S. La Salle st., Chicago, (d) G. Maffioli & Son, Rockford, (e) John Hayes Son's Co., Naperville, (f) H. C. Goeltz, Oak Park, (g) Illinois Engineering and Construction Co., 2017 Ogden ave., Chicago; furnishing pipe, 1,764 ft. vit. pipe per foot, (a) 11c., (b) 14c., (c) 13c., (d)

13., (e) 15c., (g) 12c.; 50 "Y" connections, (a) 50c., (b) 30c., (c) 50c., (d) 30c., (e) 50c., (g) 23c.; trenching, laying pipe and backfilling per ft., (f) 5c.; 221 ft. of 5-6 ft. cut, (a) 25c., (b) 35c., (c) 35c., (d) 40c., (e) 40c., (g) 48c.; 1,255 ft. of 6-7 ft. cut, (a) 30c., (b) 40c., (c) 47c., (d) 50c., (e) 50c., (g) 56c.; 400 ft. average 8-ft. cut, (a) 35c., (b) 55c., (c) 58c., (d) 60c., (e) 65c., (g) 72c.; four manholes, each, (a) \$17, (b) \$25, (c) \$25, (d) \$25, (e) \$25, (f) \$30, (g) \$20; two lampholes, each, (a) \$5, (b) \$3.50, (c) \$4.50, (d) \$5, (e) \$5, (f) \$6, (g) \$7; one flush tank, (a) \$46.10, (b) \$60, (c) \$60, (d) \$60, (e) \$50, (f) \$60, (g) \$55; hauling and breakage, (a) \$98; extra for cutting and replacing 33 ft. of macadam paving, (a) \$20, (b) \$10, (c) \$10, (d) \$10, (e) \$10, (f) \$6.50, (g) \$10; totals, (a) \$1,032.89, (b) \$1,301.06, (c) \$1,332.52, (d) \$1,380.22, (e) \$1,430.50, (f) \$1,503.96, (g) \$1,570.56.

Baltimore, Md.—Construction of storm water drains, Storm Water Contract No. 12: C. B. Clark & Co., Huntington Ave. and 31st St., city, \$83,246; McCauley-Manton Co., Ave. M and Ocean Parkway, Brooklyn, N. Y., \$88,439; The David M. Andrew Co., \$98,859; The Whiting-Middleton Construction Co., Sexton Bldg., \$99,981; Ryan & Reilly, Coleman Bldg., Philadelphia, Pa., \$99,705; B. F. Sweeten & Son, \$100,646; David Peoples, 60 Knickerbocker Bldg., \$100,415; W. H. & C. F. Thompson, 627 Law Bldg., \$112,228; Wm. McCarthy & Co., \$113,039; James Ferry & Sons, Inc., Grafton Sta., Pittsburg, Pa., \$143,333.—Calvin W. Hendrick, Chief Engineer, Sewerage Company.

Hamilton, O.—Building storm sewer on Hanover st.: Wirtz & Trunk, \$1,090.21; Garver Construction Co., \$1,070.01; W. H. Louthan, \$1,054.02; Frank P. Davis, \$977.50.

North Vancouver, B. C., Can.—Laying storm sewers on Mahon, Chesterfield, St. Georges', St. Andrew's and St. Patrick's aves., from the water front to 3d st.: M. P. Cotton & Co., \$36,972; Palmer Bros., \$40,080.83; Mathew and James McDougall, \$37,146.25; Romino Pinto, \$35,958.25; L. P. Laplacca, \$43,451.62; McAlpine-Robertson Construction Co., \$41,200; R. McLean & Co., \$28,620; W. Allan Kennedy, \$40,449.

WATER SUPPLY

Greenville, Ala.—Citizens have voted \$15,000 bonds for duplicates for water system and to pay off interest on bonded indebtedness.

Gurdon, Ark.—Council has granted 30-year franchise to J. B. and J. G. Gresham to construct water works and electric light plant.

Menard, Ark.—City will expend about \$60,000 on water works improvements.—John Thompson, Chairman Board of Improvements.

Corning, Cal.—Bids will be received about April 20 for construction of water works and sewer system; plans by W. F. Lunning, Red Bluff; cost about \$68,000.

Ontario, Cal.—Bids will soon be asked for construction of three reinforced concrete reservoirs, with capacities of 400,000, 1,000,000 and 2,000,000 gals. each.—F. E. Trask, Homer Laughlin Bldg., Los Angeles, Consulting Engineer.

Santa Ana, Cal.—S. S. Forney, Los Angeles, has petitioned County Board of Supervisors, Orange County, for franchise for 5 years, to lay water pipes in roads.

Alamosa, Col.—Citizens have voted to construct system of water works.

Colorado Springs, Col.—Engineer Hiram Phillips, St. Louis, Mo., has recommended increasing of capacity of water works plant by increasing 16-in. main at cost of \$130,000.

Washington, D. C.—Plans for including cost of high pressure fire service in the appropriation estimates for 1912 are being prepared by District Commissioners and will be forwarded to Congress; cost of the service will amount to about \$750,000, according to the estimates of Water Department.

Bradentown, Fla.—Citizens are urging bond issue for extending water and sewer system.

Ocala, Fla.—Council is considering election on \$100,000 bond issue to either build water works or purchase and improve those now in use.

Barnesville, Ga.—Citizens will vote April 18 on \$50,000 of bonds for extension of water, sewer, light systems, etc.

Fairburn, Ga.—J. B. McCrary & Co., Atlanta, are preparing plans for proposed water works; cost \$30,000.

Macon, Ga.—Water Committee will recommend laying of water mains on river bed in order to furnish water to North Highlands; cost about \$8,000.

Sparta, Ga.—Walton & Wagner, Atlanta, are preparing plans for water works and sewer system; cost about \$35,000.—John D. Walker, Mayor.

Burley, Ida.—Louis C. Kelsey, civil and hydraulic engineer, 402 Dooly Bldg., Salt Lake City, has submitted report and recom-

mendation to Council for construction of water works system; proposed to obtain water supply from wells and pump into a steel tower tank; estimated cost \$45,810.55.

Rockford, Ill.—Citizens will soon vote on \$200,000 bonds for the construction of water works.

Columbus, Ind.—Council has selected engineer to prepare plans for filtration plant.

Montpelier, Ind.—John P. Boyd, receiver for the Light and Water Co., has been given power to expend sum not to exceed \$1,500 for purpose of drilling two or more large water wells.

Anita, Ia.—Town has secured the services of the W. K. Palmer Co., Engineers, 717 Dwight Bldg., Kansas City, Mo., in connection with the remodeling of water works plant and the installation of municipal electric lighting plant and system; total appropriation will be approximately \$30,000; further particulars and information can be obtained from the office of the Engineers.

Brockton, Mass.—City proposes to expend \$125,000 to improve water service.

Longmeadow, Mass.—Board of Water Commissioners has recommended construction of reservoir capable of storing 350,000 gals. of water; also a pump house engine and pump.

Uxbridge, Mass.—Bids will be received about April 15 for laying water mains at estimated cost of \$8,000.—W. E. Rawson, Superintendent.

Grand Rapids, Mich.—Engineers Riggs & Sherman, Toledo, will at once prepare plans for 60-in. intake pipe.

Port Huron, Mich.—Commissioners have completed plans for replacing damaged and broken water mains at north end of city; estimated cost \$8,000.

Pacific, Mo.—Fuller-Coult Co., St. Louis, has been selected to prepare plans and estimates for water works.

Princeton, Mo.—Plans are being prepared by Rollins & Westover, Consulting Engineers, Beals Bldg., Kansas City, Mo., for construction of system of water works.

Jersey City, N. J.—Legislature has passed bill to allow Street and Water Board to spend \$500,000 for renewal of worn-out water pipes.

Woodbury, N. J.—Citizens are urging election of \$75,000 bonds to enlarge water mains.

Holland Patent, N. Y.—Village will build and maintain dam across Beaver Brook to store water.

Red Springs, N. C.—City has selected White & Platt, Durham, as engineers in charge of constructing water works and sewerage system; cost \$35,000; surveys completed.

Fargo, N. D.—Plans and specifications for filtration plant has been approved by Council; plans will contain a provision for municipal electric light plant; bids will be asked; City Auditor was also instructed to advertise for bids for boilers and pumping engines for filtration plant and power house.

East Liverpool, O.—Citizens have defeated proposition to issue \$175,000 bonds to build well water system.

Springfield, O.—Director Klein and Superintendent Cotter, of Water Works Department, will advertise for bids for force main from new to old pumping station in about two weeks.

McAlester, Okla.—Citizens will vote on bonds for building additional dam and construction of pipe line to Gaines Creek for purpose of pumping water distance of 8 miles to present water works; cost \$150,000.

Tulsa, Okla.—Superintendent Sands has recommended purchase of two 150-h.p. horizontal engines with tubular boilers, purchase of one 4,000,000-gal. high pressure pump, one 4,000,000-gal. low pressure pump, 2,000 ft. of 20-in. c.-i. pipe, 3,800 ft. of 14-in. pipe, 11 tons of 14 and 20-in. special pipe, 26,000 ft. of 6-in. and 16 tons of 6-in. special pipe, enlarging and rebuilding of pumping station and additional concrete sedimentation basin to cost \$30,000.

McMinnville, Ore.—City will remove wooden water mains on streets to be paved and replace same with cast-iron mains.

Bradford, Pa.—City proposes to lay 2,490 ft. 6-in. and 260 ft. 4-in. water mains on portions of Clarence pl., Charlotte, Euclid, Palmer and B aves.—B. A. Wise, City Engineer.

Morristown, S. D.—Cost of constructing water works has been estimated at \$10,000.—J. P. Healey, Town Clerk.

Vermillion, S. D.—W. K. Palmer Co., Engineers, 717 Dwight Bldg., Kansas City, Mo., has been engaged as engineers in connection with remodeling of water works system which is soon to be taken over by the city, and also in connection with design and construction of modern electric lighting plant and system; particulars can be had from the office of the Engineers.

Clarksville, Tex.—Citizens will vote April 25 on \$10,000 bonds to make repairs and extensions to municipal water works system.

Kirkland, Wash.—City is considering construction of water system, including drilling of well, erection of standpipe and installation of gasoline pumps.

Regina, Sask., Can.—Citizens have passed \$15,000 by-law for water works.

CONTRACTS AWARDED

San Luis Obispo, Cal.—Furnishing water pipe and connections necessary for a water pipe line from dam to the new reservoir, to H. Reed & Co., city, Conysee lock joint c.-i. pipe and fittings, \$11,146; company bid \$12,669 on steel riveted pipe; to Crane Co., San Francisco, for lock joint pipe, \$11,314; Baker Iron Works, Los Angeles, steel riveted pipe, \$11,734.

Wheaton, Ill.—To John Hayes Son's Co., Naperville, for water extension, 235 ft. of 6-in. pipe, 1 hydrant, etc., \$258.

Boone, Ia.—Constructing water mains from Des Moines River pumping station to the Boone city water works pumping station, together with suction mains at river station, to Des Moines Bridge and Iron Co., Des Moines, \$6,240.

South Bend, Ind.—Board of Public Works has decided to buy 6,800 ft. of pipe from Glamorgan Pipe and Foundry Co., Lynchburg, Va.

Fort Madison, Ia.—To Hagarty & Serog, Keokuk, for the digging of four deep city wells, from which water will be pumped for use in city instead of from Mississippi river.

Boston, Mass.—To Gibby Foundry Co. for furnishing 500,000 lbs., more or less, of iron castings, 2 1/2/1000, per lb.; to Essex Brass Foundry Co. for furnishing composition castings required by the water service, 8,000 lbs. No. 1 composition castings 20 3/4 c., 30,000 lbs. No. 2 composition castings 18 3/4 c.; 8,500 lbs. No. 3 composition castings 14 c.; to United States Cast Iron Pipe and Foundry Co. for furnishing 2,880 tons of class B iron pipe, 6, 8, 10, 12, 16 and 36-in., \$20.70, and 25 tons of special castings for the water service, \$47.

Lynn, Mass.—Furnishing 20 tons of soft pig lead, to C. F. Buckby, Peabody, 4 1/2 c. per lb.

Pittsfield, Mass.—Supplying city with 3,800 tons of water pipe, to Charles Miller & Sons, Utica, \$82,926; other bidders: United States Cast Iron Pipe and Foundry Co., New York, \$83,344; Warren Foundry Machine Co., New York, \$89,024; R. D. Wood & Co., Philadelphia, \$83,252.60; Standard Cast Iron Pipe and Foundry Co., Bristol, Pa., \$86,806.

Lansing, Mich.—Furnishing 3,000-gal. centrifugal pump with 200-h.p. motor, to Allis-Chalmers Co., Milwaukee, \$2,700.

Mount Clement, Mich.—To the Fairbanks-Morse Manufacturing Co., Beloit, to build and install big pumping engine for Municipal Water Works plant; \$5,606 net.

Geneva, N. Y.—Pump to be installed at pumping station, to Snow Pump Works, Buffalo, \$15,000.

New Lexington, O.—Constructing water works, to National Co., South Bend, Ind.

Altus, Okla.—To the Terry Construction Co., Poteau, for completing ditching, about four miles, for water and sewer systems.

Fairfax, Okla.—To J. B. Davidson, 435 Lee Bldg., Oklahoma City, Okla., for construction of water works system.—E. T. Archer & Co., Beals Bldg., Kansas City, Mo., Engineers.

Altoona, Pa.—By Board of Water Commissioners for various supplies for the department: Pipe and special castings, to United States Pipe and Foundry Co., Scottsdale; gate valves, to Daring Pump and Manufacturing Co., Williamsport; fire hydrants, to R. D. Wood & Co., Philadelphia; extension valve boxes, to Bigham & Taylor Co., Buffalo, N. Y.; manhole valve boxes, to J. W. Bain, Altoona; jute packing, to Thos. Jackson & Son, Reading; lead, to Latham Bros. & Co., Philadelphia; brass corporation goods, to Hayes Manufacturing Co., Erie; hauling, to Wilkinson & Co., Altoona; trenching, to Isaac Bender, Altoona.

Wheeling, W. Va.—Building small pump house on hilltop, to U. C. Hamilton & Sons, \$2,090.

Aberdeen, Wyo.—To James Kennedy, Fargo, N. D., for construction of 8,694 ft. of 10-in. and 6,550 ft. of 14-in. water main, \$24,850.

Brandon, Man., Can.—Water works supplies, to James Robertson & Co., Winnipeg, for headpipe, \$1.86 per 100 lbs.; pig lead, \$1.03 per 100 lbs.; to Johnson & Co., Brandon, for brass goods, "Mueller" manufacture

BIDS RECEIVED

Kingsbury, Cal.—Construction of municipal water system, George A. Rogers, \$25,971; Braun, Russell & Williams, \$23,759; F. C. Roberts, \$25,770; Western Engineering & Water Supply Co., \$25,917; P. S. Austin, \$26,310; Pacific Fire Extinguisher Co., \$25,731.

Fort Wayne, Ind.—Furnishing Board of Works 400 tons of 16, 12, 6 and 4-in. water pipe to be purchased for extension and perfecting department's circulating system: United States Cast Iron Pipe Co., \$23.85 straight; Lynchburg Foundry Co., \$23.85 for three sizes and \$24.85 for 4-in. pipe; Glamorgan Pipe and Foundry Co., \$23 for 16-in., \$23.50 for 12-in., \$24 for 6-in. and \$25 for 4-in.; the James B. Clow & Sons Co., \$23.85 for three sizes and \$24.85 for 4-in. pipe.

Bozeman, Mont.—Lining Bozeman Water Works Reservoir with concrete: S. Birch & Sons' Construction Co., Fargo, N. D., \$13,819; Fred M. Brown, city, \$14,510; J. M. Penson, Williston, N. D., \$16,118.80. Bid of the S. Birch & Sons' Construction Co. was as follows: Extra excavation, 85c. per cu. yd.; gravel fill, \$2; concrete footings, \$9.75; waterproofing, 35c. per sq. yd.; reinforced concrete, \$2.—Will S. Hartman, City Engineer.

Norwood, O.—Furnishing 2.75 miles 8 to 12-in. standard t.-c. pipe, Wm. P. Mahoney, lowest bidder, \$16,456.

Grandview Heights.—Furnishing and laying water pipes: James Westmaster Co., Columbus, Ohio, \$31,727; C. T. McCracken & Co., Columbus, \$32,475; T. C. Brooks & Son, Jackson, Mich., \$30,530; Harry T. Shaw, Columbus, \$28,407; William M. Graham, Columbus, \$2,579.

Pittsburg, Pa.—Constructing Mission St. Pumping Station building and appurtenances, Golden & Crick, 3512 Fifth St., lowest bidder, \$94,707.

LIGHTING AND POWER

Cummins, Ark.—Board of Penitentiary Commissioners is considering installation of electric light plant of 200 lights capacity, erection of 15,000-gal. cypress tank, drilling deep well and installation of water and sewerage system at State convict farm.—J. H. Page, Little Rock, Secretary.

Gurdon, Ark.—Council has granted 30-year franchise to J. B. and J. G. Gresham to construct electric light plant and water works.

Boulder, Col.—Highland Power Co. is preparing to construct high-head hydroelectric power plant.—H. von Schon, Wayne County Savings Bank Bldg., Detroit, Mich., Consulting Engineer.

Fort Lauderdale, Fla.—Fort Lauderdale Ice and Light Co. will construct electric light plant.—Henry R. Brown, President.

Barnesville, Ga.—Citizens will vote April 18 on \$50,000 bonds for extension of electric light plant, etc.

Farmington, Ill.—Farmington Light and Power Co. has been incorporated to operate heat, light and power plant; capital, \$30,000.—T. Bass, W. M. Anderson and H. E. Worden, Incorporators.

Elwood, Ind.—Council has granted franchise to manufacture and furnish artificial gas to Elwood consumers to the "home company" consisting of W. H. Hoppenrath and his successors assigned.

Farmland, Ind.—Council has accepted electric light ordinance offered by Ed Goodrich and "Jet" Moorman, Winchester, to light town for \$1,400 a year, plant to be in operation by August 1.

Kendallville, Ind.—Fred Iess, Chairman Light Committee, is interested in proposed installation of boulevard lighting system.

Shoals, Ind.—Southern Indiana Power Co. is preparing to erect power plant and dam.

Anita, Ia.—W. K. Palmer Co., Engineers, 717 Dwight Bldg., Kansas City, Mo., have been secured in connection with installation of municipal electric lighting plant and system and remodeling of water works plant; cost \$30,000.

Fraser, Ia.—The Ft. Dodge, Des Moines and Southern Railroad Co. will construct power plant to cost \$18,500.

Chesterfield, Mass.—E. E. Davis, Engineer, Northampton, is planning to build a dam and power plant along Westfield River.

Danvers, Mass.—Electric Light Commissioners will purchase site for power station and supply current to Middleton Electric Light Co.

Holyoke, Mass.—Plans have been devised for putting wires underground in Holyoke in Main st. from Sargeant to Lyman st., Dwight st., High st. from Prospect to Cabot and between Maple and Railroad and Bond sts.; estimated cost \$100,000.

Buffalo, Minn.—Franchise has been granted to J. A. Bonner to construct and operate electric light plant for 20 years.

Luverne, Minn.—Clausen Engineering Co., St. Paul, has estimated cost of electric light and water plant at \$35,000 to \$41,000.

Tower, Minn.—Citizens have voted \$16,000 bonds to develop power at Park Falls for furnishing light and power to city.

Columbia, Mo.—Water and Light Commissioners have been authorized to advertise for bids for new power house and equipments to cost about \$69,600.—J. S. Bicknell, City Clerk.

Bridgeport, N. J.—Gas plant, destroyed by explosion, will be rebuilt at once.

Elizabeth, N. J.—Estimates on cost of installing and maintaining extra gas lights on Broad st. and Morris ave., as suggested by Mayor Stem, have been submitted by the Elizabethtown Gas Co.

Classboro, N. J.—Bids for installation of an electric light plant at the Gloucester County Almshouse are asked by Board of Freeholders.

Newburgh, N. Y.—Newburgh Light, Heat and Power Co. will erect power station at Balmville; Frank E. Estabrook has submitted plans.

New Castle, Pa.—Council is considering resolution for issuance of \$100,000 bonds for installation of municipal electric light plant.

Oreland, Pa.—The Philadelphia Suburban and Electric Co. has purchased site for erecting gas and electric light plant.

Philadelphia, Pa.—Finance Committee has approved ordinance appropriating \$60,000 for improved lighting of Independence Square and for restoration of Congress Hall.

Summeytown, Pa.—Electric light plant will be built by James S. Miller to furnish light to the surrounding villages.

Lexington, S. C.—Citizens have voted to grant Lexington Electric Light and Power Co. exclusive franchise to furnish lights for town at \$1,200 per year; plant will be installed at once.—W. W. Barr, President of company.

Vermillion, S. D.—W. K. Palmer Co., Engineers, 717 Dwight Bldg., Kansas City, Mo., have been selected as engineers in connection with design and construction of modern electric lighting plant and system and remodeling of water works system.

Memphis, Tenn.—City Commission has passed resolutions asking Legislature to authorize city to issue bonds covering cost of constructing city lighting plant; the result is to be left to popular vote.

Brenham, Tex.—Council is considering installation of gas plant and distributing system; cost of plant will be about \$40,800.

Sunset, Tex.—Lone Star Gas Co. will light Main st. with gas for two years.

Portsmouth, Va.—Council will consider ordinance to compel placing underground of all wires.

Hamilton, Ont., Can.—Board of Control has recommended Council to engage E. J. Sifton, Vancouver, electrical expert, to report on cost of a municipal lighting, power and street lighting system.

Thessalon, Ont., Can.—City is considering installation of electric light plant of power house and installing another boiler, engine and generator.

CONTRACTS AWARDED

Monticello, Ark.—Installation of electric light plant to contain two 72-in. x 16-ft. return tubular boilers, 75 and 100-kw, direct-connected, alternating generators, with switchboards, wiring, piping, fittings, boiler feed pumps, feed water heater and all appurtenances, to the Ball Engine Co., Erie, Pa., for machinery, \$11,725; to Oglesby Bros., Monticello, for concrete building.

Tremont, Ill.—Constructing two reinforced concrete bridges in Elm Grove Township, to Porter-McCulla Contracting Co., Mackinaw.

Columbia City, Ind.—To Fort Wayne Electric Works, for installing electric power system for the village.

Webster City, Ia.—Electric light improvements, to C. E. Atkinson, city, \$9,897; other bidders: W. J. Zitterell, Webster City, \$9,935; Stepson & Peterson, Webster City, \$11,796; Cook Construction Co., Des Moines, \$11,548.

Webster City, Ia.—Erection of municipal electric light and power plant, to C. Atkinson, city, bid covered only the building and was \$9,897.

Franklin, Pa.—Lighting city for nine years, to Franklin Electric Co.

Fairmount, W. Va.—Furnishing two 250-h.p. boilers, to E. Keller Co., Williamsport, Pa., \$6,136.

Strathcona, Alta., Can.—Machinery for the municipal electric plant: One 600-kw generator, to Chapman & Walker Co., Toronto, Ont., \$10,160; to German, Clancey & Gridley, Edmonton, Alta., for Burham regulator, \$750; for engine, to Goldie & McCulloch Co., Galt, Ont., \$12,900; for boilers, to the Canada Foundry Co., Toronto, Ont., \$12,700; for smoke stacks, fans, \$7,304, and two feed pumps, \$1,167.

BIDS RECEIVED

Vineland, N. J.—Engine and generator for power house; For generator, Westinghouse Electric Co., \$2,103; General Electric Co., \$1,850; Rumsey Electric Co., \$1,920; Fort Wayne Electric Co., \$1,600; Triumph Electric Co., \$1,881; for engine, Hoovens, Devens, Rentschler Co., \$2,550; Ball Engine Co., \$3,317; Erie City Iron Works, \$2,710.

FIRE EQUIPMENT

Helena, Ark.—City is planning to build \$5,000 fire house.

Oakland, Cal.—Architect F. D. Voorhees has been selected to prepare plans for erection of \$13,000 fire house on Montgomery st.

Pasadena, Cal.—Citizens will vote April 21 on \$18,000 bonds for auto fire engine, hose cart and hose for Menton st. fire company.

Edison, Ga.—Fire department has been organized with Chas. E. Jennessy as Chief; equipment will be purchased.

Murphysboro, Ill.—Council has decided to purchase 40-gal. chemical engine.—J. L. Schmidgall, Mayor.

Newport, Ky.—Council is considering erection of fire house and improvement of fire alarm system.

Thibodaux, La.—City is considering installation of auto fire apparatus.

Beverly, Mass.—Town has voted \$650 for hose wagon.

Chicopee, Mass.—Residents of Aldenville have asked city for auto truck.

Holyoke, Mass.—Citizens of Aldenville are urging purchase of fire truck.

Monson, Mass.—Engineers have asked town to purchase auto truck.

Pittsfield, Mass.—Finance Commission has recommended \$5,000 appropriation for auto truck.

Southbridge, Mass.—Firemen favor 50-h.p. auto truck with two chemical tanks.

Springfield, Mass.—Council is considering plans for addition to Pine st. fire station and station and tower at North and Patton sts.

Iron River, Mich.—Village will consider purchase of combination hose and chemical wagon, drop harness, etc., on April 6.—Chas. McFarland, Chief; J. B. Henley, Secretary Fire Department.

Reno, Nev.—Council is considering purchase of auto fire engine.

Hollis, N. H.—Purchase of chemical engine is being considered.

Kearny, N. J.—Council is planning to purchase auto chemical wagon.

Perth Amboy, N. J.—Committee on Fire will secure estimates for combination fire wagon for McClellan Engine Co.

Owego, N. Y.—Village is issuing \$15,000 bonds for erection of fire house.

Rensselaer, N. Y.—Ring Fire Company is considering replacing by auto truck of horse and apparatus now used.

Devil's Lake, N. D.—Council will issue \$10,000 bonds for erection of fire station.

Cincinnati, O.—Fire Chief Archibald has submitted to Safety Director Small recommendations for additional fire protection; for California, one combination auto hose and chemical wagon, with the erection of a new fire house; estimate of cost, including the first year's pay to the men, \$23,776; same equipment for Delhi and Sayer, the estimated cost being \$17,776; College Hill and Mount Airy, automobile hose and chemical engine with full complement of men and a new engine house at cost of \$27,075.

Beggs, Okla.—Council will purchase gasoline engine and 500 ft. of hose.

Matamoras, Pa.—Town will organize fire department; 1000 ft. of hose will be purchased.

Port Kennedy, Pa.—Fire company has been organized.—H. S. Hittell, President.

Edgerton, Wis.—Council has empowered Committee to purchase and install a fire alarm system; bell tower will also be erected and all yard hydrants will be ordered out.

Worland, Wyo.—Volunteer fire department has been organized.—F. Kent, Chief.

CONTRACTS AWARDED

Lexington, Ky.—By City Council Committee, to Miles Automobile Co., Louisville, lowest of six bidders, for one Knox triple combination engine and hose wagon, \$8,600; one Knox combination chemical engine and hose wagon, \$5,600; 2,500 ft. of hose, one deluge set with patent platform; two perfection holders with patent reducers.

Long Branch, N. J.—Furnishing engine, to American-La France Fire Engine Co., Elmira, N. Y., \$4,700.

Utica, N. Y.—Constructing central fire station on corner of Elizabeth and Burnet sts., to R. Richards & Son, \$50,822; contract for plumbing and gas fitting in building, to the McKeough-Danquer Plumbing Co., \$2,528.

BIDS RECEIVED

Washington, D. C.—Erecting fire house at Rock Creek road and Georgia Ave., N. W.; W. E. Mooney, \$21,175; Arthur L. Smith, \$22,755; Burgess & Parsons, \$23,500; Hoge & Luehert Co., Inc., \$22,432; Allan T. Howison, \$21,965; Skinner & Garrett, \$22,640; Randolph L. Jennings, \$22,780, and W. H. McCray, \$24,943.

BRIDGES

Marysville, Cal.—Supervisors are discussing proposition of building two new bridges in districts of Supervisors Mellon and Casey.

Washington, D. C.—Bridge spanning Rock Creek Park at Colvert st. will be reconstructed at once at cost of about \$12,000; plans by District Engineer Bailey.

Doctortown, Ga.—Wayne County Commissioners, Jessup, and Liberty County Commissioners, Hinesville, are considering construction of bridge over Altamaha River at Doctortown.

Muncie, Ind.—The Delaware County Commissioners are asking for bids for construction of four bridges.

Leavenworth, Kan.—Engineer John O'Neill has estimated cost of erecting bridge across Three Mile Creek on South 3d st. at \$21,319.

St. Paul, Minn.—Plans are being prepared for construction of proposed Great Western bridge over Mississippi River.

St. Louis, Mo.—Mayor Kreismann will recommend election on bonds for proposed municipal bridge.

West Seneca, N. Y.—Town Board has been empowered to build iron bridge across Cazenovia Creek at Lein's Park at cost of \$12,000.

Valley City, N. D.—City will soon ask for bonds for 75-ft. span steel foot bridge, width 6 ft., to be erected at entrance to City Park.—C. A. Mahre, City Engineer.

Hamilton, O.—County Commissioners are considering erection of bridge over Four Mile Creek.

Marion, O.—County Surveyor Edward S. Ault is preparing plans and specifications for abutments of five bridges to be built by County over the Little Scioto River.

Toledo, O.—Arnold W. Brunner, New York, will be employed to prepare the plans for beautification of Cherry St. Bridge, if the recommendation of Service Director Cowell, seconded by Mayor Whitlock, is approved by Council.

Natrona, Pa.—Allegheny and Westmoreland Counties Commissioners are considering erection of bridge between Natrona and Braeburn; cost about \$225,000.

Pittsburg, Pa.—County Commissioners are planning to erect 16 bridges this year at cost of \$281,150.

Pawtucket, R. I.—Council has passed ordinance providing for appropriation of \$20,000 for construction of bridge at North Main st.

Columbia, S. C.—W. G. Childs, J. Pope Matthews, Clarence L. Kibler, Julian B. Friday and G. C. Taylor will constitute Bridge Commission to be named by the Governor to have charge of bond issue of \$75,000 to be used in purchasing or erecting new bridges across Congaree and Broad Rivers.

Galveston, Tex.—Bids will be asked by County Commissioners for erection of bridge at head of Dickinson Bayou.

Lampasas, Tex.—County has voted bonds for erection of bridge across the Lampasas.

Wichita Falls, Tex.—Citizens have voted \$151,000 bonds to build wagon bridge across Wichita River.

CONTRACTS AWARDED

Mount Holly, N. J.—By Burlington County Board of Freeholders, to the Ferro Concrete Co., Harrisburg, to construct bridge at Wallace's Mill.

Petersburgh, N. Y.—Constructing reinforced concrete arch bridge of 85-ft. span over Hoosick River, to Cole-Mortland Co., Bennington, Vt., \$2,700.

Chambersburg, Pa.—Building concrete bridge at Spring st.; to Nelson-Merydith Co., \$649; other bidders: Aug. Wolf, \$717.40; A. Buchanan, \$819; Kriechbaum & Son, \$664; Hood st. concrete bridge, to Kriechbaum & Son, \$1,075; other bidders: Nelson-Merydith Co., \$1,648; Aug. Wolf, \$1,379.30; A. Buchanan, \$1,579.

Fredericksburg, Va.—By Spotsylvania Road Board, to I. D. Ireland, Richmond, for building concrete girder bridge over Hazel Run on improved Spotsylvania road, \$1,843.

BIDS RECEIVED

Pittsburg, Pa.—Constructing piers of the new bridge to be erected between the Point and the Northside; Dravo Contracting Co. lowest bidder, \$182,750; other bidders: Crawford Construction Co., \$196,836; C. M. Driven, \$198,737; Charles McDermitt, \$206,000; John Monks & Sons, \$196,950; Missouri Valley Bridge and Iron Co., \$194,500; Drake & Stratton, \$209,500; Friday Contracting Co., \$207,789.

MISCELLANEOUS

Gadsden, Ala.—Comissioner's Court is considering purchase of dump cart for convict gangs to use on road.

Los Angeles, Cal.—C. D. Cox, Detroit, Mich., has been appointed as landscape engineer by Park Commissioners; will map out improvements for various parks of city.

St. Augustine, Fla.—Mayor Eugene Masters has recommended that asphalt road oil be applied upon all shell streets.

West Palm Beach, Fla.—Citizens will vote May 2, extension of time, on \$32,000 bonds for city dock and sea wall.

Liberal, Kan.—County Commissioners are considering plans for erection of \$10,000 jail.

Henderson, Ky.—Mayor W. I. Thompson will recommend to Council to set aside \$2,000 for purpose of oiling 2d st, Hlinois Central Railroad to Main, and Main for its full length.

Rockville, Md.—Board of County Commissioners are considering erection of jail.

Fitchburg, Mass.—Finance Committee will recommend purchase of auto patrol and ambulance.

Lawrence, Mass.—Special Committee has recommended purchase of auto combination patrol and ambulance.

Somerville, Mass.—Municipal incinerator plant has been destroyed by fire.

Hoboken, N. J.—Council is considering erection of \$100,000 addition to city hall.

Paterson, N. J.—Board of Works has decided in favor of destructor system of garbage disposal.

Ridgefield Park, N. J.—Plans and specifications by C. B. Deer, Preston st., for municipal building to be erected on corner of Hackensack road and Park st., have been adopted by Board of Trustees; bids will be advertised for.

Akron, O.—Board of Control has rejected all bids for erection of public comfort station at Main and Market sts.

Columbus, O.—Ordinance has been approved by Council Streets Committee directing Service Director to purchase 30 horses or mules and 15 sets of double harness for street cleaning department at a total cost of \$7,000.

Columbus, O.—Finance Committee has approved \$43,000 bond issue for municipal removal of rubbish, ashes and manure; money is to provide for purchase of horses and wagons enough to operate system until July 1.

Bend, Ore.—Council has decided to erect \$10,000 city hall.

Prineville, Ore.—Citizens will vote May 1 on erection of \$10,000 city hall; plans prepared.

Woodburn, Ore.—Erection of city hall is being considered.

Fort Worth, Tex.—City is preparing to install police and fire alarm underground

system in business district; cable will be laid in conduits; cost \$30,000.

Bennington, Vt.—Citizens will vote on \$2,000 bonds for erection of city hall.

Olympia, Wash.—City hall to cost \$150,000 will be erected at 3d ave. and Main st.

Milwaukee, Wis.—Committee on Public Buildings has decided to report favorably on resolution to have plans drawn for public bathhouse on the shore of Lake Michigan in South Shore Park.

Milwaukee, Wis.—Council has agreed to issue \$100,000 bonds for contagious disease hospital on south side.

Regina, Sask., Can.—Citizens have passed \$22,000 by-law for street cleaning.

CONTRACTS AWARDED

Middletown, Conn.—Sprinkling streets for coming year, to A. Brazos & Sons, \$2,375.

Boston, Mass.—To J. P. O'Riorden for furnishing teams for watering and oiling streets in the East Boston district, \$5.40 for two-horse hitches; other bidders: Chelis Rossetti, \$5.35; A. De Stefano, \$5.48; Hugh Nawn Contracting Co., \$5.75 for two-horse and \$8 for three-horse hitches.

Boston, Mass.—Watering and oiling streets in various city districts, as follows: South Boston and Dorchester North, to Frank E. Wilson, \$4.88 for 2-horse hitch; other bidders, Thomas F. Lynch, \$5; John H. Winsloe Contracting Co., \$4.94 on 2-horse and \$6.49 on 3-horse hitches; Hugh Nawn Contracting Co., \$5.15 and \$8 on 2 and 3-horse hitches, respectively; Charles-

town, to J. P. O'Riorden, for 2-horse hitch, \$5.40; other bidder, Hugh Nawn Contracting Co., \$5.75 for 2-horse and \$8 for 3-horse hitches; Brighton, to Joseph McGreevey, \$5.35 for 2-horse and \$6.50 for 3-horse hitches; other bidders, Hugh Nawn Contracting Co., \$5.75 for 2-horse and \$8 for 3-horse hitches; John Kelley, 2-horse, \$5.45; Joseph Sprissler, \$5.50; West Roxbury, to M. McGinnis & Co., \$5; other bidders, Joseph Sprissler, \$5.50; John Kelley, \$5.45, on 2-horse hitch; Hugh Nawn Contracting Co., \$5.15 on 2-horse and \$8 on 3-horse; Dorchester and Ashmont, to John H. Winsloe Contracting Co., \$4.84 on 2 and \$6.49 on 3-horse hitches; other bidders, John J.

Loonie, \$5.30; Joseph Sprissler, \$5.50; Hugh Nawn Contracting Co., \$5.15 on 2 and \$8 on 3-horse hitches; Roxbury South and Jamaica Plain, to James E. Noble, \$5; other bidders, John Kelley, \$5.25; Joseph Sprissler, \$5.25 on 2-horse hitch; Hugh Nawn Contracting Co., \$5.25 on 2 and \$8 on 3-horse; J. McGreevey, \$5 on 2-horse and \$6.50 on 3-horse hitches; South End and Roxbury North, to Joseph Sprissler, \$4.85; other bidders, N. McCabe & Son, \$4.98; John Kelley, \$5.45 on 2-horse hitch; Hugh Nawn Contracting Co., \$5.25 on 2 and \$8 on 3-horse; James E. Noble, \$5.10 on 2 and \$6.50 on 3-horse; Joseph McGreevey, \$4.95 on 2 and \$6.50 on 3-horse hitches; North and West Ends and Back Bay, to William Gilligan Co., \$5 on 2 and 3-horse hitches; other bidders, John T. Keough & Bro., \$4.85 on 2 and \$6.75 on 3-horse; Hugh Nawn Contracting Co., \$5.25 on 2 and \$8 on 3-horse; Joseph McGreevey, \$5.25 on 2 and \$6.50 on 3-horse hitches.

Boston, Mass.—Additions and alterations to L st. bathhouse, to Christopher F. Brown, \$27,936; other bidders, Rendle & Stoddard, \$29,936; A. Varnerin Co., \$31,844; John J. Flynn, \$32,400; William H. Keyes & Co., \$37,221.

Buffalo, N. Y.—To Velie Motor Vehicle Co., Moline, Ill., to furnish two auto ambulances, \$7,300.

Little Falls, N. Y.—Sprinkling streets, to Owen Rogers, \$680.

Cincinnati, O.—Building Celestial st. steps, to Ross Bros., \$6,892.80; building comfort station and bandstand in Burnet Woods, to Wm. Miller & Sons, \$6,258.

Hazleton, Pa.—Furnishing of metal signs warning autoists to run slow, to T. C. Bright & Co., two lines, \$87. Collecting and removing garbage to Louis Meiss, \$1,500. Cleaning sewer inlets to N. Eposito, \$1,349.

York, Pa.—By Highway Committee of Council for city carting during ensuing fiscal year, to the General Supply and Construction Co., to furnish six one-horse carts and drivers at 23.8c an hour, and John W. Stahl, double teams, when required, at 38c an hour.

Spokane, Wash.—Furnishing police emergency auto, to Metropolitan Motor Car Co., 1318 Second ave., for \$3,500 locomobile.

SAVE YOUR TREES

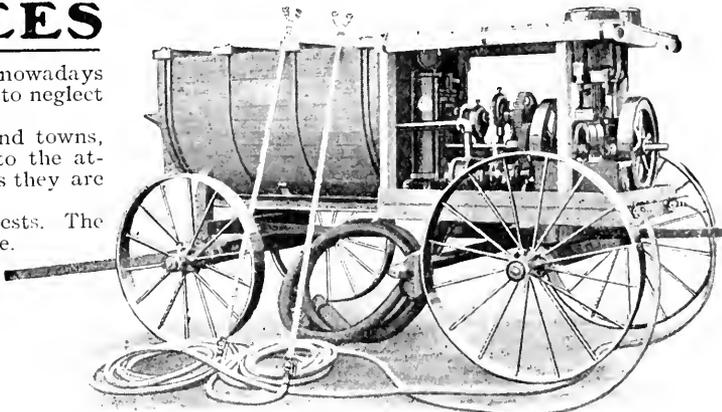

The private citizen who owns a fruit orchard nowadays knows that he might as well cut down his trees as to neglect to spray them.

The large and beautiful shade trees of cities and towns, which by the way add more than anything else to the attractiveness of a place, will surely disappear unless they are sprayed.

It is easy to keep the upper hand of the insect pests. The orchardist does it and takes it as a matter of course.

The cost of a **Spraying Outfit** to "Save the trees" is insignificant as compared with the value of the trees. Drop us a line and we will send you our catalogue, also give you full information on the subject if desired.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Pennsylvania	Dormont	Apr. 7, 8 p.m.	Grading, curbing and paving portion of Greenmount ave.	H. M. Stille, Chm. Street Com.
Pennsylvania	Edgeworth	Apr. 10, 7:30 p.m.	Grad. and improve. Woodland Rd. with Kentucky Rock Asph.	R. W. Dixon, Chm. Street Com.
Texas	Galveston	Apr. 10, 11 a.m.	Paving with mudshell, clam shell, gravel or other material about 3,500 cu. yds.	John M. Murch, County Auditor. Geo. R. Starns, Dir. Pub. Wks.
Pennsylvania	Philadelphia	Apr. 10	Resurfacing and repairing various streets and avenues.	John J. Wenner, Clk. Bd. Pub. Serv.
Ohio	Cincinnati	Apr. 12, noon	Grading, setting granite curbs and paving with brick portions of Bardes and Benton alleys.	John W. Gauthier Dir. Pub. Serv.
Ohio	Akron	Apr. 12, noon	Laying sidewalks.	John J. Wenner, Clk. Bd. Pub. Serv.
Ohio	Cincinnati	Apr. 12, noon	Grading, setting granite curb and paving with brick portion of Ahler alley.	John J. Wenner, Clk. Bd. Pub. Serv.
Illinois	E. St. Louis	Apr. 14	Improving 38th street and an alley.	Jas. F. Parr, Asst. City Engr.
Ohio	Columbus	Apr. 14, noon	Paving Summit street with asphalt or brick.	City Clerk.
Ohio	Cincinnati	Apr. 14, noon	Grading, setting granite curb and paving with brick portion of Ross Alley.	John J. Wenner, Clk. Bd. Pub. Serv.
Indiana	Rushville	Apr. 15	Constructing macadam road in Anderson twp.; 2 gravel roads in Ripley and Poscy townships.	J. M. Stone, County Auditor.
New York	Johnstown	Apr. 17	Paving portion of West and East State streets, about 11,815 sq. yds. bituminous macadam and 3,000 stone curbing and 1,885 sq. yds. cobble gutter.	Grover E. Yardon, City Clerk. City Clerk.
North Dakota	Grand Forks	Apr. 17	Paving various streets.	Jos. R. Thatcher, Director.
New Jersey	Washington	Apr. 17	Macadamizing 6.04 miles of road.	
Ohio	Dayton	Apr. 18, noon	Grading and paving with macadam, brick, sheet asphalt, creosoted wooden blocks or other material various streets and avenues.	J. C. Ely, Dir. Pub. Serv.
New York	N. Tarrytown	Apr. 18	Improvement to highways in the town of Mt. Pleasant.	Edw. F. Hennessey, Town Clerk.
Michigan	Morenci	Apr. 21, 1 p.m.	Paving various streets with brick.	C. R. Kellogg, Village Clerk.
New Jersey	Moorestown	Apr. 24	Constructing macadam road on Central ave. & No. Church rd.	Wm. B. Lippincott, Chm. Twp. Com.
Ohio	Ashland	Apr. 24	Grading and paving with brick Diamond Alley.	Edgar Koehl, City Clerk.
Florida	Jacksonville	Apr. 28, 10 a.m.	Resurfacing St. Johns ave. about 27,000 sq. yds. with as. mac.	Gail L. Barnard, County Engr.
Ohio	Cincinnati	Apr. 28, noon	Improving the Eight Mile road in Anderson township.	Stanley Struble, Pres. Bd. Co. Comrs
SEWERAGE				
Minnesota	Duluth	Apr. 7, 10 a.m.	Extending sanitary sewer in various streets.	Olof G. Olson, Pres. Bd. Pub. Wks.
Ont., Can.	Walkerville	Apr. 11, noon	Constructing brick sewer in portion of Victoria road.	Cecil H. Robinson, Town Clerk.
New York	Binghamton	Apr. 12, 4 p.m.	Constructing sewer in Charles street; furn. vitrified pipe and appur; furn. sewer cleaning machine.	S. W. Murray, Clk. Bd. C. & Sup.
Ohio	Toledo	Apr. 13, noon	Constructing sanitary sewer in various streets.	Fred Shane, Secy. Bd. Pub. Serv.
New York	Buffalo	Apr. 15, 11 a.m.	Constructing 18, 15, 12 and 10-in. sewers in various streets.	Francis G. Ward, Comr.
Iowa	Burlington	Apr. 15	Furnishing a direct connected centrifugal pump and steam turbine; w. w. surface condenser and air pump, etc., etc.	Frank Lawler, Supt. Citizen W. Co.
New York	Fulton	Apr. 17	Furnishing c.i. water pipe and standard castings.	J. A. Foster, Pres. Bd. Pub. Wks.
Ohio	Niles	Apr. 18	Constructing a 3,000,000-gal. water filtration plant.	Board of Control.
New York	East Aurora	Apr. 18	Constructing sewer system including disposal plant, value of work about \$110,000.	Alfred Brotherhood, Pres. Bd. V. T.
Manitoba, Can.	Winnipeg	Apr. 19	Constructing a wooden stave conduit pipe line.	H. N. Ruttan, City Engr.
Ohio	Toledo	Apr. 27, noon	Installing complete high pressure fire system.	John M. Babcock, Clk. of Council.
Florida	Pensacola	May 2	Constructing 15,060 lin. ft. storm water drains from 10 to 66-in. in dia.; and 23,880 lin. ft. of san. sewers from 6 to 24-in.	John A. Merritt, Chm. Bd Bond Tr.
WATER SUPPLY				
Ontario, Can.	Berlin	Apr. 13	Furn. c. i. pipe, hydrants, valves, lead, water tower.	Bowman & Connor, Con. Engr.
North Dakota	Fargo	Apr. 27	Furnishing a high duty crank and fly wheel pumping engine with a capacity of 4,000,000 gals. each 24 hours; constructing a water purification plant complete 4,000,000 gals daily.	E. R. Orchard, City Auditor.
BRIDGES				
Texas	Galveston	Apr. 10, 11 a.m.	Constructing wooden bridge over Todds Bayou.	John M. Murch, County Auditor.
Texas	Galveston	Apr. 17, 11 a.m.	Constructing reinforced concrete bridge.	John M. Murch, County Auditor.
LIGHTING AND POWER				
Ohio	Hamilton	Apr. 13, noon	Furnishing 30 or more ornamental cast iron lamp posts.	C. M. Robertson, Clk. Dept. P. Serv.
MISCELLANEOUS				
Minnesota	Minneapolis	Apr. 11, noon	Furnishing one electric hospital ambulance.	Richard Tattersfield, Secy. B. C. & C.
New York	Schenectady	Apr. 12, 2:30 p.m.	Constructing a cottage at the pumping station.	Harry F. Miller, Secy. Bd. C. & Sup.
New Jersey	S. Orange	Apr. 18	Oiling about 8 miles of street during coming season.	William H. Kemp, Chm. Twn. Com.

STREET IMPROVEMENTS

Washington, D. C.—American Minister Fred W. Carpenter, of Tangier, has forwarded copies of specifications for construction of road from Martil River to Tetuan, and one plan, drawn to scale, in profile of the road; award, which is estimated to cost about \$40,000, will be made publicly at Tangier on May 30. Address No. 6489, Bureau of Manufactures.

Orient, Me.—Town has appropriated \$1,000 for highways.—I. D. Robbins, Town Clerk.

Orange, N. J.—Mayor Julian A. Gregory has recommended paving of Main st.

Columbia, S. C.—Cost of paving Gervais st., Sumter to Pulaski, has been estimated at \$8,089.29 per block.—John McNeal, City Engineer.

Granger, Tex.—Citizens have voted \$100,000 bonds to build good roads in Justice Precinct No. 2, Williamson County.

Lockhart, Tex.—Citizens have voted \$50,000 bonds to build good roads in this Precinct.

Dayton, Wash.—City is considering several blocks of paving.—Geo. Jackson, Mayor.

CONTRACTS AWARDED

Colfax, Ia.—Paving to cost \$50,000, to Turner Improvement Co., Des Moines.

Findlay, O.—To Taylor & Biggs, city, for construction of nine miles of pike in Huron County, \$42,000.

Seattle, Wash.—Building Chas. Davie's road, to W. N. Lord, \$6,449.

SEWERAGE

Washington, D. C.—Report from American consul in a European country states that local publication has recently announced that bids will be received for construction of sewer system; Consul writes that time for submitting bids is short, but he believes that he can secure an extension in case any American firms are unable to present their bids within the time limit already fixed; if American contractors decide to present tenders they should cable consulate, stating definitely how long time is needed, with the assurance that bids will be forwarded if extension of time is granted. Address No. 6485, Bureau of Manufactures.

Lehighton, Pa.—Citizens are urging installation of sewers.

Madison, S. D.—Citizens will vote Apr. 18 on \$65,000 bonds for sewer purposes.

WATER SUPPLY

Susanville, Cal.—Susanville Water Co. is planning to lay larger water mains.

Baxter, Ia.—Citizens will vote on \$14,000 bonds for installation of water works plant.

Kenton, O.—Citizens will vote Apr. 11 on \$40,000 bonds to rebuild water works.

Rawlins, Wyo.—City Board of Trustees has ordered surveys made and plans drawn for extensions and improvements to present water supply system as follows: Construction of one rein. concrete reservoir of 500,000 gals. capacity, one reinforced concrete reservoir of 100,000 gal. capacity, laying of 8,000 ft. of 6 and 8" c.-i. water mains, installation of one motor-driven air com-

pressor plant to raise 400 gal. per min from well 130 ft. deep, one motor-driven direct-connected 4" centrifugal pump to pump against a head of 120 ft. and deliver 400 gal. per min. Plans will be completed financial arrangements made and bid asked for in this work about June 1st. Turpin & Eldridge, Civil Engineers, Hugu Block, are making the plans and will supervise the construction when built.

CONTRACTS AWARDED

Dallas, Tex.—Furnishing 500 water cut off boxes, to Dallas Foundry Co., 60c. per box.

Ogden, Utah.—To Moran Contracting Co. for concreting city reservoir No. 1, \$14,597.85; other bidders: McKay & Reed, \$15,797.85; J. P. O'Neill Construction Co., \$17,270.60; Gilles Construction Co., \$17,689.29; Lynch-Cannon Engineering Co., \$17,746.31; Wheelwright Construction Co., \$18,763; Wm Doyle, \$19,679.20.

LIGHTING AND POWER

Los Angeles, Cal.—Franchise for building electric lighting system in Eagle Rock district has been sold by Board of Supervisors to Eagle Rock Water Company.

Eldora, Ia.—Park Dam Power Co. has been granted franchise for installation of light and power plant.

Roland, Ia.—Citizens will vote Apr. 18 on \$8,000 bonds for installation of electric light plant.

Langford, S. D.—Franchise has been granted to C. B. Hersey Co. to install electric light plant.

FRONT VIEW OF CARR SQUARE ENTRANCE AND COMFORT STATION

PARK ENTRANCE AND PUBLIC COMFORT STATION

Ornamental Brick and Stone Structure, Under Which are Shower Baths and Toilet Rooms—Used by Half a Million People in a Year—Details of Arrangement and Construction

By CHAS. CLAUDE CASEY

THE Park Department of St. Louis has given the patrons of Carr Park, one of the congested district breathing places, what seems to be an unusual building. It is an ornamental park entrance built over an underground bath house and comfort station.

As will be seen from the photographs, the structure has the appearance of a park entrance and would hardly impress anyone passing the street in front of the park as anything else. From the inside of the park it looks different only in that the two small buildings at each side of the entrance proper have pillars, one marked "men" and the other "women."

Immediately in front of the entrance on the inside is another pillar, or wide post, of brick and masonry, and just beyond this is a stairway leading down in front of which is a heavy stone-capped railing and gate.

Another feature that makes the entrance unusual is that the

paving, both inside and outside of the structure, is of glass—the ordinary vault lights so common in business districts but not often found in such locations. This makes a smoother walk, or pavement, than granitoid, the glass squares being set in an iron frame and cement. It also delivers sufficient light to the rooms below, which otherwise would be little less than dungeons.

The idea of the building originated in the park department of which Phillip C. Scanlan is the head, and the plans were drawn under the direction of C. M. Talbert, assistant to Andrew J. O'Reilly, then president of the Board of Public Improvements. Mr. Talbert is now first assistant to Maxime Reber, present head of the board, and supervised the construction.

The cost of the building was \$16,500. It is a permanent structure of concrete, brick, stone and tile, the last being used for the roof covering and part of the floors. Marble slabs

separate the water closets in the comfort station, on both the men's and women's sides. The stairways are of steel and concrete, with iron railings.

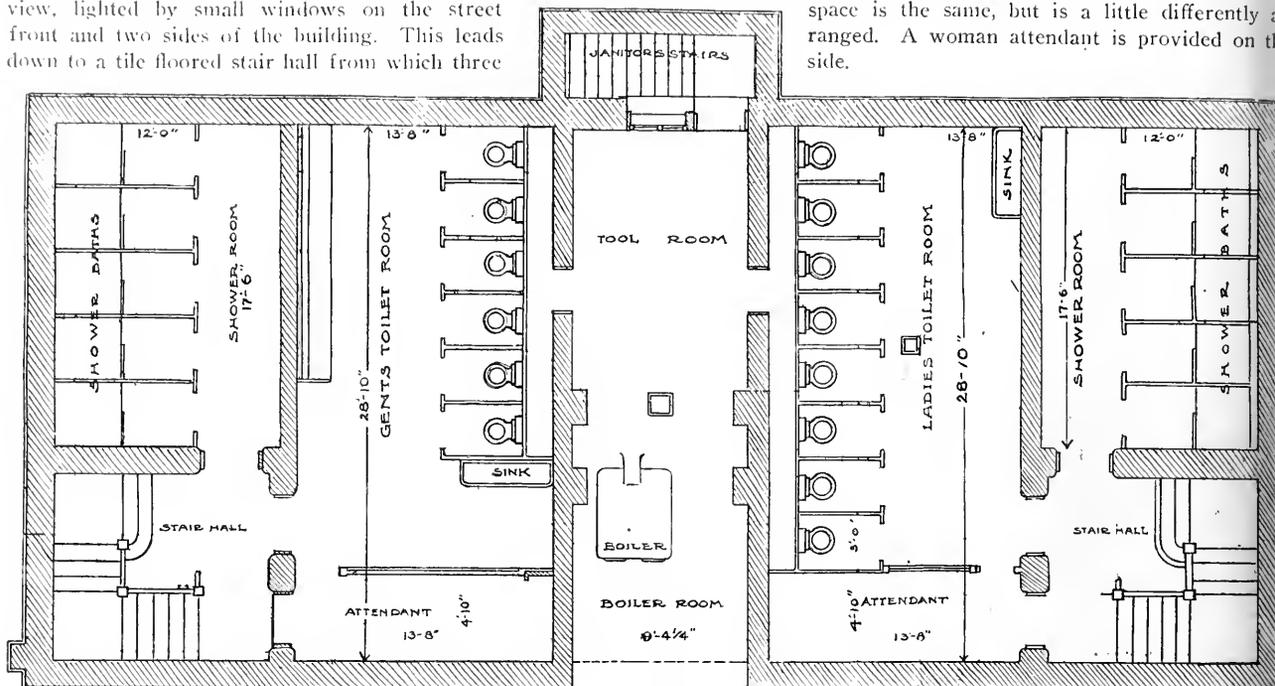

Though the widest part of the structure above ground, from front to back, is 12 feet, exterior measurement, the underground area is nearly 2500 square feet, or 31 feet 10 inches by 67 feet 8 inches, with a room 17 feet x 18 feet projecting from the main underground buildings under the sidewalk at the front of the entrance.

Entering the strong heavy door in the rear of the little buildings at either side, a stairway of ample size comes into view, lighted by small windows on the street front and two sides of the building. This leads down to a tile floored stair hall from which three

length. This slab is 21 inches wide and 14 feet long. Along the wall to the right are six water closets, divided by marble slabs, each space being 3 feet by 4 feet 6 inches.

The third door opening from the stair hall opens into shower bathroom. This is provided with five shower baths. This was originally intended to divide these with marble slabs in spaces 3½ feet square, with a tiny dressing room, 3½ x 4 feet adjoining, provided with doors, but this idea was abandoned and the showers are all open.

The women's side is the same as the men's reversed, except that two additional closets take the place of the urinal. This space is the same, but is a little differently arranged. A woman attendant is provided on this side.

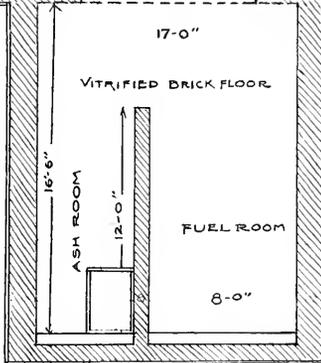

ENTRANCE AND PUBLIC COMFORT

STATION. PLAN OF BASEMENT

doors open. One of these doors leads directly into the railed-off office, and is usually open from the middle up, a cut or "dutch" door being provided. The other opens into a little waiting space in front of the attendant's office, which is 4.5 x 13.6 feet. This office has a maple floor, big lockers, desk, etc. The space between the attendant's room and the toilet room is the same length and a foot wider than the attendant's room.

The men's toilet room is 13 feet 8 inches by 19 feet 10 inches, with a concrete floor, draining to the center. Along the wall to the left is a marble slab urinal, in the floor, draining to a sewer opening at its mid-

Between the two separate parts of the station is a space, 9 feet 4 inches by 31 feet 10 inches, used as a tool room and boiler room for heating the underground apartments and water for the shower baths. The entrance to this is entirely separate from that to the other apartments, a stairway being provided behind the ornamental stop, back of the entrance proper referred to above.

The masonry pillar which stands back of the entrance, and which serves as a stairway, built along strong heavy lines, the same as the balance of the building, and is further made useful and ornamental by utilizing it as a drinking fountain. An iron

INTERIOR OF MEN'S TOILET ROOM

ONE CORNER OF SHOWER BATH ROOM

argyle projects from the center in front, delivering a small stream of water to the wide concrete basin below.

An ash room, 5 1/3 x 16 1/2 feet, and a fuel room, 8 x 16 1/2 feet, with vitrified brick floors, project under the sidewalk toward the street, with openings in the walk for dumping coal and removing ashes.

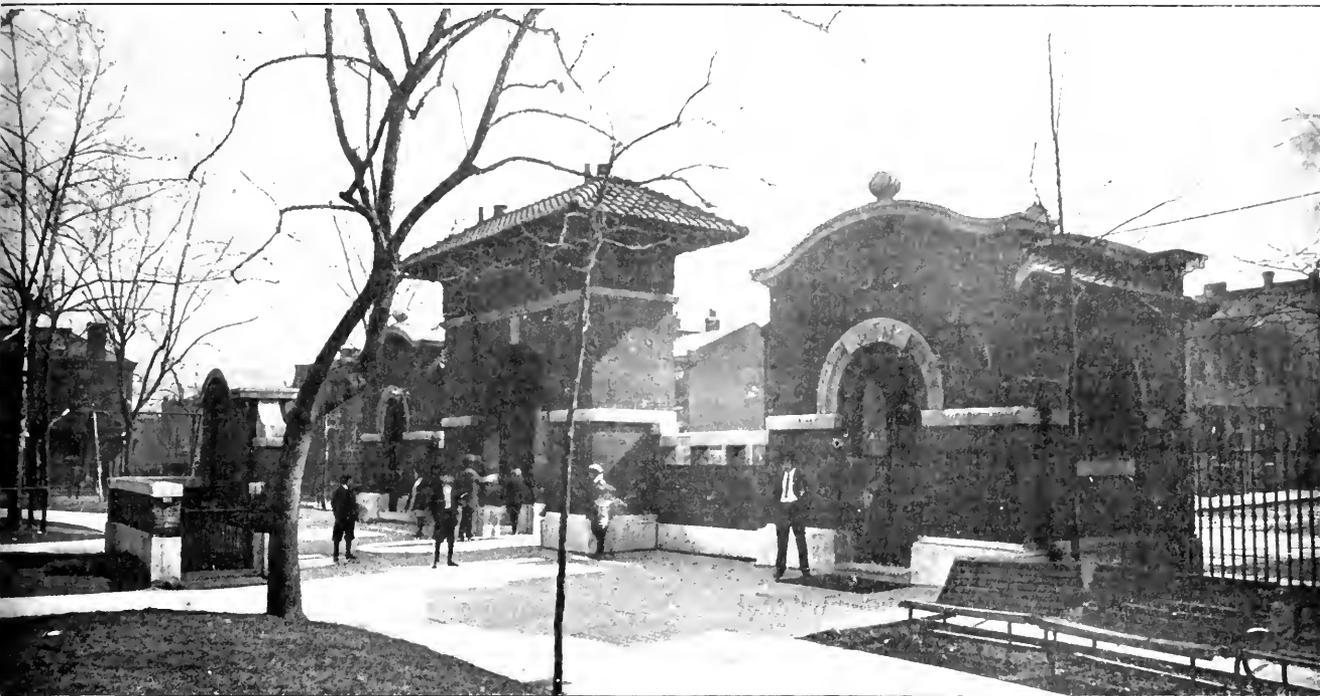

To render the underground rooms dry, a coating of coal tar pitch 1 inch thick was applied to the outside of the concrete walls. This makes the rooms as dry as they would be if above ground.

ACID MINE DRAINAGE AND POLLUTION

(From Annual Report of Board of Health of Altoona for 1910.)

It has long been the opinion of those who have studied the health conditions of Altoona that the city water was comparatively free from bacterial life, and that the acid condition due to mine drainage from the Baker and Glen White mines was an important factor in maintaining that condition.

The results of a series of experiments made by the Pennsylvania Department of Health indicate that this opinion has a solid foundation. The conclusions arrived at in the laboratories

ENTRANCE AND COMFORT STATION VIEWED FROM INSIDE PARK

The comfort station is used by thousands of people in the summer months when the park becomes the front yard of the people living in the tenements of the congested district. It has been estimated by the park department that fully 1,000 people live in each of the blocks that bound Carr park. Benches are placed close together in the one-block breathing space, but in good weather during the summer it is difficult to find an empty space on a bench at night. Occasional public band concerts add greatly to the attendance at the park.

Figures kept by the park department show that 338,162 men, women and children used the comfort station privileges of the building in the nine and a half months between April 6, 1910, when it was opened, and January 29 last, the latest figures available.

It was intended originally to make the little shower bath rooms of service to the general public, but another and larger bath house has been built eight or ten blocks away, and the general purpose of the new place was abandoned. It is used daily by several thousand children, however, during the playground season. Boys and girls by the dozen run into the apartments assigned to their use and after stripping to the skin stand under the cool showers to wash off the dirt and perspiration after their healthful play.

Two sinks, with towels, are provided also, one on each side, for the use of the public. On the men's side the sink is in the little waiting space just outside the attendant's railing; but in the women's side it is set back against the wall in the end of the toilet room.

Two attendants are employed all the year around, one for the men's side and one for the women's. These employees also serve as janitors and keep the places clean. The park keeper is in charge.

of the Health Department are as follows: "Mine drainage will prevent the growth of typhoid bacilli after the lapse of one hour. Mine water will markedly limit the growth of colon bacilli so that they die off progressively and cannot be cultivated after a lapse of twenty-four hours. The organisms lived for three days, but could not be found on the fourth day in one experiment in which the dilution was high." "The only inference that can be drawn from the experiments is that, so far as the risk of the most serious of all water pollutions is concerned, that by the typhoid bacillus and its companion and index, the colon bacillus, and inferentially the cholera bacillus, which is known to succumb readily to sulphuric acid, the attempt to exclude mine water from streams which may eventually become sources of drinking water would be a mistake. Evidently neither of these organisms can live for any considerable time in water containing these wastes in any appreciable quantity. Especially is this true of that most dangerous and elusive bacillus, that of typhoid fever. Data are not yet available to indicate to what distance from the mine the protective influence of these wastes will extend." Since the only sewage that finds its way into our water supply is at the head of the streams, and for the most part above the mines, the distance from the mines to which the protective influence of the drainage would extend is not of much importance to us.

In the same report attention is called to the fact that during high water in the streams, when the water is coming down in torrents, the volumes of fresh water overcome the acidity of the mine waters and, the dilution being sufficient, preclude any germicidal effect of the acid mine water. In the Altoona water supply, however, this danger is reduced to the minimum by the flood channel, which, running parallel with the reservoirs, carries away all the water during heavy rains.

SEWAGE DISPOSAL EXPERIMENTS

Conducted in Philadelphia During Past Two Years — Screening and Sedimentation — Contact, Sprinkling and Intermittent Filters — Sludge Disposal

In 1905 the Pennsylvania State Legislature passed an act authorizing the Commissioner of Health, the Governor and Attorney-General to prevent the discharge of sewage into any of the waters of the State, and in exercising this authority they directed the city of Philadelphia to submit to the Department of Health, on or before the year 1912, a comprehensive plan for the collection and disposal of the sewage of the city. In order to carry out this order the City Council directed the Department of Public Works to establish an experimental station for studying the methods of sewage disposal available for treating the sewage of the city. In 1908 there was organized a division of the Bureau of Surveys of this department known as the sewage disposal division, which was placed under the direction of principal assistant engineer Geo. E. Datesman. The assistant engineer in charge from Sept. 21, 1908, has been W. L. Stevenson. There have also been engaged in this work a chemist, an assistant chemist and a bacteriologist. This operating force began experimental work on March 23, 1909, and continued the same until May 15, 1910. A description of the experimental station and of the experiments then being conducted was published in MUNICIPAL JOURNAL AND ENGINEER for October 27 and November 3, 1909.

The Bureau of Surveys has just published a report of the experiments conducted and the results and conclusions derived therefrom, this giving a full and complete description of all apparatus and methods, with tables and diagrams and also photographs of the apparatus, the whole forming a very complete statement of the experiments conducted and containing a great deal of valuable information concerning practically all methods of sewage disposal which have come into general use. We hope in future issues to abstract a number of the more interesting and important descriptions of the results from these experiments, but for the present will give merely a summary of the conclusions as found in the report. These, it will be seen, cover screening and sedimentation, slate and ordinary contact beds, sprinkling filters, sand filters, disinfection and dilution; also a special consideration of sludge and the methods of disposing of it. This summary is of considerable interest, but it fails to give any indication of the many small points in connection with the construction and maintenance of sewage disposal plants which were studied and elucidated by this investigation.

SUMMARY OF CONCLUSIONS.

Fine Mesh Screening

The 35 mesh per inch screen removed one-third of the suspended matter in the crude sewage as applied; prevented the formation of scum in subsequent sedimentation tanks, and prevented the clogging of nozzle orifices on the sprinkling filters.

Sedimentation

For the purpose of comparison, the results of sedimentation are given in percentage removal, although it is recognized that effluents which are produced with equal percentage removal are not comparable on the basis of solids content.

Horizontal Flow

Three and one-half hours nominal flow through a baffled sedimentation tank removed two-thirds of the suspended solids in the crude sewage; an increased storage did not produce a proportionate improvement in the efficiency of the tank. Baffling by equalizing velocity through the cross-section prevented dead spots in the tank and restrained sludge and scum at the inlet end.

Between periods of three and a half to six hours' flow the influent was not deoxidized nor rendered offensive when sprayed upon sprinkling filters. To prevent septic action the tanks required sludging and washing out every six weeks.

Vertical Flow

The Emscher or Imhoff tank studied illustrated the principle involved, inasmuch as the substantial separation of the sewage flow from the digesting sludge keeps the sewage fresh and eliminates offensive odors either in the effluent, the sludge or in the gas developed.

The removal of suspended solids from the crude sewage was but little more than one-half due to the shallowness of the tank; the efficiency may be increased in tanks of working size.

Slate Contact Beds

The best results were accomplished when this bed was filled twice a day or at a rate of two million gallons per acre per day. Crude sewage applied deposited three-fourths of the suspended solids; the effluent was slightly nitrified and rendered partially stable.

The deposit on the slates was inodorous, resembling earth and could be removed by flushing in the small size bed experimented with.

Where slates are not a waste product the construction of the bed would be costly.

Contact System

The primary and secondary beds treating settled sewage did not mature sufficiently to yield a stable effluent, although it was very low in suspended matter. The highest rate obtained was 1,350,000 gallons per acre per day. With sewage containing less trade waste better results might have been obtained.

Sprinkling Filters

Distribution.

Best results were obtained with fixed sprinkler nozzles where the film of sewage was made to constantly travel back and forth over the media, without a resting period; this caused a uniform rate of flow from the underdrains.

Rate of Operation

A regular uniform rate of operation produced better results than the same net rate obtained irregularly. With filters exposed to the weather and receiving sewage partially settled the maximum rate obtained was two and a half million gallons per acre per day, but in the winter the stability of the effluent deteriorated.

With a filter protected from the weather, having fine screened and settled sewage uniformly distributed over its surface, and having a ventilating system, the maximum rate used was three and one-tenth million gallons per acre per day. The effluent was practically always stable. How far this would have been affected by exposure to the weather was not determined.

Kind of Media

Trap and gravel maintained their initial size. Limestone and slag disintegrated to a slight extent.

The smooth surface of the gravel stones was not as well adapted to the formation of a bacterial jelly as rougher media and the extreme roughness of slag caused it to retain the deposited solids.

The rough, irregular cinders removed all the suspended matter from coarsely screened sewage, so that clogging soon ruined the bed.

Size of Media

The completeness of preliminary treatment partially controlled the size of media in subsequent filtration.

In filters exposed to the weather and receiving sewage partially settled, operating at two and a half million gallons per acre per day, best results were obtained from trap media one inch to three inches in size. Under the more favorable conditions of fine screened and settled sewage as an influent uniformly distributed, at a rate of three and one-tenth million gallons per acre per day, media three-quarters inch to one and a half inches produced an excellent effluent.

Depth of Bed

Filters of less depth than six feet were not satisfactory, but from filters six feet or more in depth effluents could be obtained at rates between two and a half and three million gallons per acre per day of satisfactory quality. The additional depth over six and one-half feet did not seem to be economical.

Maturing

Filters exposed to the weather, receiving sewage partially settled, and put in operation in March, yielded a satisfactory effluent in three weeks, and after three months the effluent was perfectly stable.

A filter protected from the weather, having fine screened and settled sewage uniformly distributed over its surface, and put in operation in July, yielded a perfectly stable effluent after one week of service.

Unloading

In filters operated at rates between two and one-half and three million gallons per acre per day media composed of stones approximately uniform in size completely unloaded the solids stored up in the interstices, whereas media composed of stones of great diversity in size became badly clogged but did not unload.

Effect of Freezing Temperature

No trouble was experienced from the formation of ice upon the surface of the filters; biological activity was decreased by

low temperature to such an extent, however, that at a rate of two and one-half million gallons per acre per day the fine rain and graded mixture beds pooled and the effluents of all exposed filters were of lower stability than in summer.

Elimination of Surface Growth

Fungus growths on the surface were completely removed by an application of calcium hypochlorite dissolved in water.

The continual disinfection with calcium hypochlorite of the influent to a filter maintained its surface in perfect condition and did not interfere with the biological action of the bed.

Bacterial Efficiency

The average number of bacteria in the effluent of a mature sprinkling filter operated at rates between two and one-half and three million gallons per acre per day was 400,000 per c.c., which represented a removal of 86 per cent from the crude sewage.

Bacterial efficiency within a limited range of small size tone was proportionate to depth of bed.

Settlement of the Effluent

When the effluent was passed through a settling basin in two hours much improvement was obtained by the removal of the suspended matter.

Hamburg and Intermittent Sand Filter

A filter modeled after the so-called Hamburg type, in which distribution is effected by a layer of fine coke; also a shallow, coarse size sand filter both operated at too low a rate to be economical for the conditions in Philadelphia.

Disinfection

Fresh sewage from which suspended matter larger than 1/25 inch had been removed was disinfected to a practical degree with calcium hypochlorite; the amount of disinfectant required depended upon the amount and condition of the organic matter in the sewage.

Economy of design and operation can be attained by short storage and mechanical agitation to insure contact of the disinfectant and the sewage.

Dilution

Crude sewage when passed through a fine-mesh screen or satisfactorily settled to remove the solids larger than 1/25 inch, and disinfected with calcium hypochlorite to yield six parts per million available chlorine, was added to river water in proportions up to one to ten, and its purification accomplished without offense to sight or smell nor the depletion of the dissolved oxygen of the river water below 50 per cent saturation.

Sludge

Amount

Horizontal flow in sedimentation tanks produced sludge 88 per cent moisture at an average rate of five cubic yards per million gallons sewage.

An Emscher tank with 4½ feet vertical flow produced sludge 2.6 per cent moisture at an average rate of 9/10 cubic yard per million gallons sewage.

Condition

Cleaning plain sedimentation tanks caused considerable offense, but the sludge withdrawn from the Emscher tank had tarry odor and was not offensive.

Scum formed on sedimentation tanks except when the influent was screened.

Digestion

The placing of sludge from a sedimentation tank in a water-tight, uncovered tank for digestion did not prove successful.

agooning

Wet sludge from plain sedimentation tanks placed in earth lagoons to a depth of 12 inches in moderate weather dried to a consistency fit to remove within the six weeks elapsing between cleaning tanks, and its volume was 4/10 of that pooled.

Sludge Bed

Fine sand or sawdust over a coarse stone drainage floor was more efficient for reducing moisture in sludge than a plain earth lagoon.

Wet sludge from a sedimentation tank, applied six inches deep in winter weather, under cover, dried to a consistency fit to remove in six days, and under the same conditions but not under cover in twelve days.

Based upon small size tests in winter weather, Emscher sludge 12 inches deep upon a sand bed dried to a consistency fit to remove in 12 days during freezing weather. In Germany the time is given as from four to five days, but sludge is not withdrawn in freezing weather, which accounts for the difference.

When equal weights of rice coal and wet sludge were mixed and placed on sludge beds, the mixture was fit to remove in one day, and was successfully burnt.

STANDARD PAVING SPECIFICATIONS

Adopted This Year by Association for Standardizing Paving Specifications—Concrete Pavements, Foundations and Sidewalks—Wood Block

THE standard specifications adopted by the Association for Standardizing Paving Specifications at its February meeting have finally been published in the *Proceedings* of the society. These *Proceedings* and the specifications therein have been copyrighted, "Not for the purpose of limiting the use of the matter herein to members of the association only. On the contrary, the legitimate use of the same will be granted gratis to those who make written application to the Executive Committee, stating exactly what part or parts of the *Proceedings* it is the desire to use and for what purpose."

In general most of the new specifications follow very closely those adopted last year and published by us at that time, although certain of them are practically new throughout. In view of the fact that last year's specifications were published by us complete it does not seem worth while to repeat the unchanged portions, but we will indicate where changes have been made, referring to the pages in Volume XXVIII (January to June, 1910) of MUNICIPAL JOURNAL AND ENGINEER. Secretary Hittell has granted permission to make such extracts on condition that we make the following statement in connection therewith: "By permission of the association these extracts are reprinted from the copyrighted *Proceedings* of the Association for Standardizing Paving Specifications. John B. Hittell, secretary-treasurer, 5917 Winthrop Avenue, Chicago."

CONCRETE PAVEMENTS AND FOUNDATIONS

On pages 362 to 364 of MUNICIPAL JOURNAL AND ENGINEER were published standard specifications for cement, concrete sidewalks, curb and combined curb and gutter, concrete pavement foundations and concrete pavements. The specifications this year follow these exactly so far as the cement is concerned. In the specifications for concrete sidewalks the only change is the addition of a paragraph as follows:

"The base shall be — inches in thickness, with its upper surface finished parallel to and — inches below the grade of the finished sidewalk. The minimum thickness for base shall be 3 inches."

Under the head of Forms, the new specifications read, "The forms shall be well staked and thoroughly braced and set to the established lines," the words "thoroughly braced" being new.

Under the head of Top or Wearing Surface appears the new paragraph, "This wearing surface shall be — inches in thickness. The minimum thickness for wearing surface shall be ½ inch."

Also the following has been added: "No concrete shall be mixed while the air temperature is below 32 deg. Fahr., and if this temperature is reached at any time before the wearing surface is laid, the foundation or other concrete shall be immediately provided with such covering as will protect it from all damage. In no event shall concrete walks be laid on a frozen foundation."

The specifications for concrete curb and combined curb and gutter have been changed by the addition of the same paragraphs as to thickness and laying in freezing temperature as were just quoted. Also the second paragraph of article 11 is changed and added to to read as follows:

"The mortar for the facing shall be mixed in a mortar box and spread in place immediately after mixing. The facing or wearing surface of the curb shall be placed on the inside of the forms as the body of the curb is being built up. In no case shall the facing be placed after the base has set."

The specifications for concrete pavement foundations are similar to the old except for the addition of a paragraph on thickness similar to that for the thickness of concrete sidewalk foundations (with a minimum thickness of 4 inches instead of 3) and the paragraph concerning laying in freezing

temperature already given; and with article 9 changed to read as follows: "When completed, the foundation shall be kept moist for not less than two days and it shall be protected from traffic until the concrete has thoroughly set."

The specifications for concrete pavements are unchanged except for the addition of the paragraph concerning laying in freezing temperature, and another on thickness similar to that for the thickness for concrete sidewalk foundations, with a minimum of 5½ inches. There was also suggested by the committee a paragraph on guarantee, but the committee was unable to agree upon the time, some favoring no guarantee beyond one year, and others favoring a five-year period. This was discussed by the convention, which voted to recommend a two-year guarantee, the vote being two to one.

The Committee on Cement and Concrete Pavements was composed of the following: N. E. Murray, chairman, superintendent of sidewalks, Board of Local Improvements, Chicago, Ill.; James E. Faris, member Board of Public Works, Kansas City, Mo.; L. J. Myers, city engineer, Ardmore, Okla.; J. E. Ramsey, consulting engineer, Salisbury, N. C.; A. F. Damon, Jr., consulting engineer, Chester, Pa.; W. H. Broadhurst, chemist, Borough of Brooklyn, New York City.

WOOD BLOCK PAVEMENT

The specifications for wood block pavement adopted last year were published on pages 320 to 321 of MUNICIPAL JOURNAL AND ENGINEER. In these the following changes are made this year. Instead of specifying that the wood to be treated shall consist of "long leaf yellow pine," "Southern yellow pine" is substituted. Similarly in the second paragraph, which began "Yellow pine blocks shall be cut from what is known as prime timber, namely, all timber must be sound, commercial long leaf yellow pine," the new specifications state "Yellow pine blocks shall be made from what is known as Southern yellow pine." The third paragraph is changed to read, "In yellow pine timber the annual rings shall average not less than eight to the inch and shall in no case be less than four to the inch, measured radially."

In the description of the oil to be used there are several changes. Article 1 is changed to read "The specific gravity shall not be less than 1.10 nor more than 1.14 at a temperature of 38 deg. C." In the second paragraph 3 per cent is changed to 3½ per cent. In the third paragraph for the words "35 per cent up to 315 deg. C." are substituted "and shall be not less than 30 or more than 40 per cent up to 315 deg. C." The words "the mean of three determinations to be taken" are omitted.

The paragraph on Filler is changed to read "The joints between the blocks shall be filled with pitch, asphalt residuum or dry, fine sand. (The committee recommends sand for heavy traffic streets.)"

Under the head of Expansion Joints it is specified that these shall be one inch in width and placed every 100 feet, instead of ½ inch in width and placed every 50 feet, as last year.

To these specifications is added an appendix giving a description of the method of analyzing coal tar creosote, which is referred to in article 3 of the specifications for oil, being an extract from Bulletin No. 65 of the American Railway Engineering and Maintenance of Way Association. This appendix is reprinted on page 520 of this issue.

The committee stated that it had considered the matter of the preservative very carefully and "found that the oil specified may not only be produced in the open market at reasonable cost, but also may be manufactured by any one competent and willing to erect the necessary plant, and this plant, moreover, would not be prohibitive from a financial standpoint. The committee is satisfied, from the testimony of the different parties examined and from the experience of its own members, that the oil with a specific gravity of 1.10 is best suited for treating wood blocks, when it is considered that a waterproofing as well as a preservative compound is desired." The committee recognized that this oil "is not a direct product of distillation, but is formed by the addition of a coal tar pitch. It

has accordingly changed the positive amount of 35 per cent heretofore specified as the maximum to be distilled up to a temperature of 315 deg. C. to the variable amount of not less than 30 nor more than 40 per cent."

The Wood Block Committee was composed as follows: George W. Tillson, chief engineer, Bureau of Highway Borough of Manhattan, New York City; Andrew Rinke, city engineer, Minneapolis, Minn.; N. S. Sprague, superintendent Bureau of Construction, Department of Public Works, Pittsburg, Pa.; James C. Travilla, member Board of Public Improvements and street commissioner, St. Louis, Mo.; M. McKenna, city engineer, Bridgeport, Conn.; Felix A. Norden, member Board of Local Improvements, Chicago, Ill.; W. P. Taylor, engineer of tests, Philadelphia, Pa.; Walter M. Cross, city chemist, Kansas City, Mo., and Cassius V. Kelly, city engineer, New Haven, Conn.

The new specifications for the other kinds of paving will be given next week.

FUEL BRIQUETS FROM STREET RUBBISH

THE following statement by U. S. Consul Frank W. Mahin of Amsterdam, Holland, is published in the Consular and Trade Reports.

Hitherto rubbish collected by street cleaners in Amsterdam has been assorted; paper, rags, metals, and glass have been sold to dealers therein, the residue as manure.

The city authorities are now considering converting the street rubbish as a mass into combustible briquets for heating boilers. They have found that at Southwark, London, and St. Ouen, France, street rubbish is transformed into a marketable product. At Southwark all the refuse is crushed to powder, which is sold as a manure. At St. Ouen the powder thus made, with the addition of combustible substances, is formed into a cheap fuel. The Amsterdam authorities experimented at both those places, combining powder made with coal tar from the Amsterdam gas works and pressing the substance into briquets. The experiment was successful and disposed the Amsterdam authorities toward establishing a plant for producing briquets from street rubbish.

The quantity of material which can be worked in this city is about 140,000 tons a year. It is estimated that an establishment to work this will cost about \$200,000; that the annual expense thereof will be about \$98,000; that the product will be about 85,000 tons, costing \$1.15 a ton. It is believed that the briquets can be sold for a net price of \$1.40 a ton, which would yield a profit of over \$20,000 a year. At present the street refuse of Amsterdam is disposed of at a loss of \$18,000 a year. Besides the anticipated financial profit, it is reasoned that the danger in times of epidemic will be much reduced by this transformation of street refuse, which amounts to destruction.

WALLINGFORD MUNICIPAL ELECTRIC PLANT

IN the report of the municipal electric plant of Wallingford, Conn., for the year ending 1910, the finances of the plant are set forth in great detail, the accounts including insurance on boilers and building, office rent, interest, depreciation, legal expenses and apparently all other legitimate expenses which should be charged against it. After deducting these from the income there is left a balance of \$5,663.77. There probably should be a deduction from this for interest, since the amount of interest paid was but \$1,925, whereas the value of the plant is about \$120,000. This, however, would still leave a balance of about \$2,800.

The average watts developed by the steam plant per pound of coal consumed was 151, or the average pounds of coal per kw. of output was \$6.64. The coal cost \$4.08 per ton delivered at the plant and the average cost per kw. for fuel was 1.62 cents. The average total cost per kw. at the steam plant was 5.4 cents. About 36 per cent of the output was developed by a water plant, and the cost per kw. here, including 5 per cent interest and 5 per cent depreciation, was 1.62 cents. The total output for the entire year was 549,365 kw. The total income averaged 6 cents per kw. generated.

Philadelphia Sewage Disposal Experiments

THE city of Philadelphia has conducted for a little over a year a series of experiments on sewage disposal which are of great interest and value to engineers and others engaged in the study and practical adaptation of sewage disposal methods. The experiments of the Massachusetts State Board of Health and the reports upon the same, which are unsurpassed for completeness and scientific thoroughness, are recognized in Europe as well as in this country as being of the greatest importance and reliability, although their value has been somewhat restricted during the past few years by a conservatism in the adoption of new ideas which seems to us unnecessary and unfortunate. The tests conducted by the cities of New Orleans and Columbus added greatly to our information concerning some of the later methods of sewage treatment and probably had considerable effect upon the general adoption of certain of them, although neither introduced any new methods.

The Philadelphia experiments in turn have supplied us with data concerning some still more recent ideas, especially screening and sedimentation tanks, including the Emscher tank; with certain conclusions as to details of sprinkling filter construction and as to results which can be obtained with the use of hypo-

chlorite in adapting more or less crude sewage to disposal by dilution. Especial attention was paid to the subject of the disposal of sludge, which still remains one of the most serious and least satisfactorily solved problems of sewage disposal.

While much of the report published by the Philadelphia investigators consists of tables and data which are too voluminous for publication in a periodical, and which would be of value chiefly to experts, there were a great many deductions drawn from these bearing upon minor points of construction and operation which are not given in the general summary of conclusions published this week, and these we are expecting to give abstracts and synopses of from time to time during the next few weeks.

Paving Specifications

ANOTHER publication of more than ordinary interest which has just reached us is the *Proceedings* of the Association for Standardizing Paving Specifications, containing the specifications revised and adopted by that association in February of this year. Considering the short time which has elapsed since the convention for the publication of the *Proceedings* these have been gotten out in very good shape and with comparatively few typographical errors. Our chief criticism is that they do not contain the specifications as finally decided upon in those cases where they were amended or added to by the convention as a body, but give the specifications as reported from the committees, any modifications made by the convention as a whole being given elsewhere as a part of the proceedings. It seems to us that it would have been better to have interpolated such changes and additions at the proper places in the specifications as reported, noting, if it seemed desirable, that these were variations from the original report.

Except for two or three points concerning which satisfactory conclusions were not reached we believe that these specifications are considered by the association as being final so far as it is concerned, and recommended to all cities for adoption. While the association has copyrighted these in order that they may not be used commercially, it is their desire that they be adopted generally by all cities; and in furthering this we are expecting to publish all of them where they are entirely or largely new, or to note the changes made from those of last year where these are few in number. This week we take up the specifications for concrete pavements, pavement foundations and sidewalk work and those for wood block pavements. These will be followed during the next two or three weeks with a presentation of the remaining specifications adopted by the association.

Material for Water Conduits

IN a report upon a new water supply for Cumberland, Md., by Mr. James H. Fuertes, a brief discussion is given of the material available for constructing a conduit several miles in length. Concerning this the report says:

The estimates of cost of the conduits for bringing the water from distant sources are based upon the use of wood stave pipe for pressures up to about 90 pounds per square inch. Where the pipe lines cross deep ravines and the pressures on the pipes would be in excess of 90 pounds per square inch, riveted steel pipe or cast iron pipes have been provided for, depending upon the pressures and on the location. As a rule, it is proposed to use cast iron pipes under all important stream crossings.

Wood stave pipe is an approved and well tried form of construction for pipe lines operating under moderate heads, and when properly built of suitable materials and when the alignment is laid out with due regard to the hydraulic questions involved, is a durable, substantial and useful form of construction. Its cost is only about one-half that of steel pipe of equivalent carrying capacity and about one-third that of cast iron, while its life, when intelligently designed and constructed, should be as great as that of either cast iron or steel.

Another very important advantage is that their cost is so low that they could be replaced at least three times for the cost of one cast iron pipe line, and this low cost of construction frequently makes it possible to bring the total investment necessary within the limit of expenditure possible to a city when the cost of a long cast iron pipe line might be prohibitive.

The statements as to cost are probably for that locality only, and the relations between the costs of the several kinds of pipe might be constantly different in other sections of the country. Engineers should, however, bear in mind the practicability of using not only the materials herein referred to, but even certain additional ones, such as vitrified clay with water-tight joints where the head is very light. There is too often a tendency to confine oneself to materials which have been used in former work, forgetting to consider the possibilities of others which may be not only cheaper but better adapted to meet the requirements of the case.

Analyzing Coal Tar Creosote

Extract from Bulletin No. 65 of the American Railway Engineering and Maintenance of Way Association. See page 518 of this issue.

SAMPLE

In view of the fact that everything depends upon the samples taken for analysis, too much care cannot be used to make sure that such samples are strictly average ones of the whole bulk of the oil.

To this end the oil should be completely liquefied and well mixed before any samples are taken. Wherever possible, a drip sample of not less than 2 gallons should be taken, commencing after the oil has started to run freely. Where this cannot be done, as, for instance, in large storage tanks, samples should be taken from various depths in the tank, by means of a tube or bottle, the number of samples depending on local conditions.

For taking samples during the process of treatment, it is desirable to take a sample of oil from the storage tank about one foot from the bottom of the tank before the cylinder is filled, and, where possible, a sample directly from the cylinder during the process of treatment. For this purpose a thermometer well, as shown in attached figure, is recommended.

The sample to be analyzed should be thoroughly liquefied by heating until no crystals adhere to a glass stirring rod, and also well shaken, after which one-half shall be taken for analysis and the balance reserved as a check test.

APPARATUS

The apparatus for distilling the tar oil or creosote must consist of a stoppered glass retort similar to that shown in the diagram, having a capacity as nearly as can be obtained of 8 ounces up to the bend of the neck when the bottom of the retort and the mouth of the offtake are in the same plane. A nitrogen-filled mercury thermometer of good standard make, divided into full degrees centigrade, must be used in connection therewith. The bulb of the retort and at least 2 inches of the neck must be and remain covered with a shield of heavy asbestos paper, shaped as shown in diagram, during the entire process of distillation, so as to prevent heat radiation, and

between the bottom of the retort and the flame of the lamp burner two sheets of wire gauze, each 20-mesh fine, and at least 6 inches square must be placed.

It is also recommended that the flame be protected against air currents. An ordinary tin can from which a portion of the bottom and all of the top have been removed, placed on support attached to the burner, as shown on the diagram, has been found to answer the purpose.

DISTILLATION

Before beginning the distillation the retort should be carefully weighed and exactly 100 grammes of the oil placed therein, the same being placed in the retort. The thermometer should be inserted in the retort with the lower end of the bulb $\frac{1}{2}$ inch from the surface of the oil, and the condensing tube attached to the retort by a tight cork joint. The distance between the bulb of the thermometer and the end of the condensing tube should not be less than 20 nor more than 24 inches and during the progress of the distillation the thermometer must remain in the position originally placed.

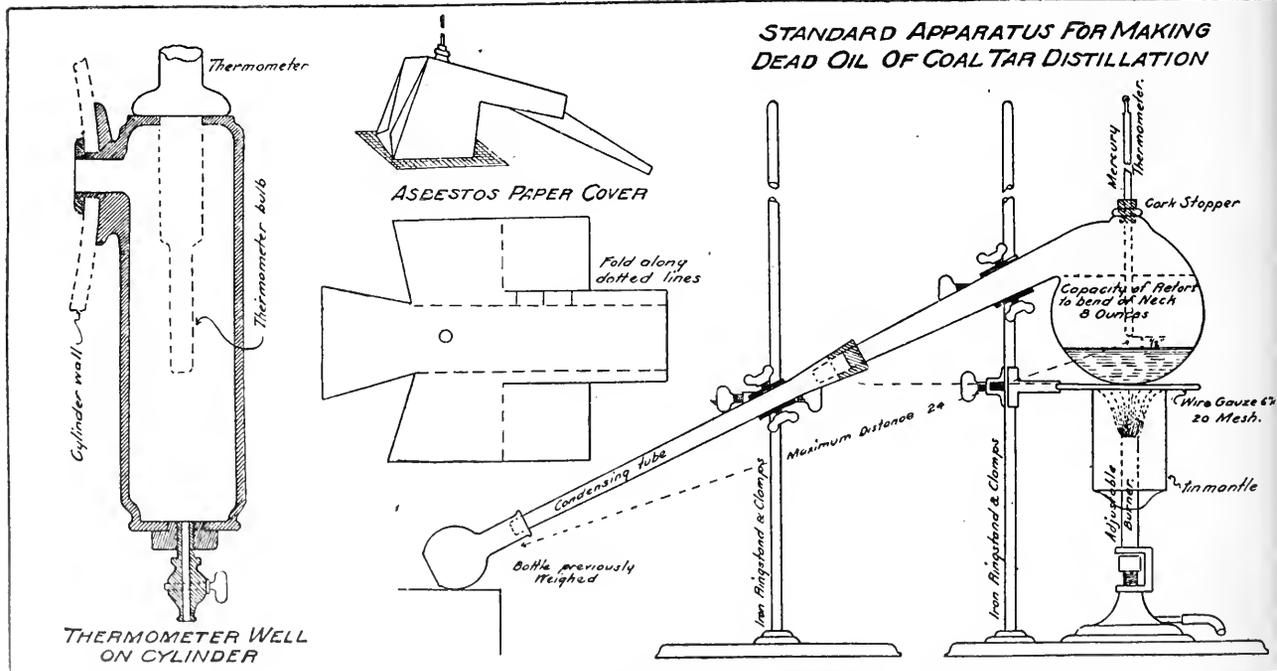

The distillates should be collected in weighed bottles and fractions determined by weight. Reports are to be made the following fractions:

- 0 to 170 degrees Centigrade.
- 170 to 200 degrees Centigrade.
- 200 to 210 degrees Centigrade.
- 210 to 235 degrees Centigrade.
- 235 to 270 degrees Centigrade.
- 270 to 315 degrees Centigrade.
- 315 degrees Centigrade and above.

For practical purposes there will be no need of reporting all of these fractions. It will be sufficient to report on the following fractions as follows:

- Below 200 degrees Centigrade.
- 200 to 210 degrees Centigrade.
- 210 to 235 degrees Centigrade.
- 235 to 315 degrees Centigrade.
- Above 315 degrees Centigrade.

Reports are to be made on individual fractions. In making such reports it is to be distinctly understood that these fractions do not necessarily refer to individual compounds. In other words, the fractions between 210 and 235 deg. will not necessarily be all naphthalene, but will probably contain a number of other compounds. The distillation should be a continuous one, and should take about 45 minutes. When a measurable quantity of water is present in the oil, the distillation should be stopped, the oil separated from the water and returned to the retort, when the distillation should recommenced and the previous readings discarded. In obtaining water-free oil it will be desirable to free about 300 to 600 c.c. of the oil by using a large retort and using 100 grammes of water-free oil for the final distillation. In the final report as to fractions a correction must be made of the amount of water remaining, so that the report may be made on the basis of a dry oil.

APPARATUS FOR TAKING SAMPLE OF AND DISTILLING CREOSOTE

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Buy New Roller

Burlington, Ia.—The city has purchased an eight-ton tandem roller for use in repairing and improving streets. This new roller is a small brother of the huge steam roller which the city now owns, and is also propelled by steam. It is easier to handle and gets over the ground quicker and may be used in many places and at times when it is not possible to move the big roller. The list price of the new machine is \$2,500, the city getting a good reduction. It is the intention of keeping the larger roller for heavy work and for spiking macadam. By inserting spikes in the wheels this heavy contrivance can tear up a macadam street just as easily as it can pack the stone.

Want Park Board to Have Charge of Street Opening

Bloomfield, N. J.—To avoid litigation in the proposed opening of a new Mechanic street in Bloomfield to take the place of the one vacated by the Town Council of Bloomfield for the Lackawanna Railroad improvements, forty residents of the First district of the Third Ward at a meeting held at the home of Assistant Postmaster John R. Conlan last week voted to appeal to the Legislature for relief. To this end a committee was appointed to endeavor to get a bill through the Legislature to bring the property southwest of the present Mechanic street into the care of the Essex Park Commissioners. The object of getting the proposed bill through is to have a boulevard as an approach to the new depot from East Orange, extending to Glen Ridge on the north and eventually to the park system in Montclair. Such a bill, if passed, will eliminate the assessment and litigation that may arise for damage suits in the opening of the new street.

Demand Sewers Be Laid Before Paving

Springfield, Ohio—Threatened with an injunction suit unless time was first given in which a sewer can be put down on East High street from Limestone to Spring, Service Director Klein will not allow this section of East High street to be finished until some sewer connections are established. Frank Mills, president of the Pythian Castle Company, called upon Mr. Klein yesterday afternoon and told him that an injunction suit would be filed should the contractors attempt to tear up the southern half of the street before a sewer is installed. "We cannot build unless we have sewers," said Mr. Mills, "and we will have to have them put in first." Mr. Klein said it would be several weeks before the work was finished, and the sewer could be put in in the meantime, and that he expected no trouble. Work of tearing up the old pavement started yesterday.

Laid a Million Yards of Paving in Six Years

New Orleans, La.—City Engineer W. J. Hardee has sent the following letter to Mayor Martin Behrman, giving the amount of pavement laid during the years of his administration:

Hon. Martin Behrman:

Dear Sir: Believing that you would like to know what the records of this department show. I have had the following tabulation of street pavements made, according to which you will observe that in the six years that you have been mayor, 274,368 more square yards of such pavements were laid than in the entire history of the city of New Orleans up to and before the time you became mayor.

Kind of Pavement.	Previous to Jan. 1, 1905. Since Jan. 1, 1905.	
	Sq. Yd.	Sq. Yd.
Asphalt	576,475	625,582
Vitrified brick.....	138,300	10,201
Small granite.....	10,166	30,919
Bitulithic	155,663
Granitoid	138,808
Mineral rubber.....	38,136
Total	724,941	999,309

W. J. HARDEE, City Engineer.

SEWERAGE AND SANITATION

Decisions in the Bronx Sewer Cases

White Plains—Supreme Court Justice Mills has handed down two decisions affecting the appraisal of damages of land taken for the Bronx Valley sewer, within the borders of the City of Yonkers. In the case of the land of William E. Hauptauf, which runs south on Bronx River road from Yonkers avenue, the justice sends the matter back to the commission for re-appraisal and rehearing. The plot was considered as one parcel, and \$16,718 was awarded to the owner. The latter claim that it should have been considered in plots and lots, as laid out, containing 58 separate parcels and the court upholds him in his contention. Parcel 73-A ran through the center of Bronx place, a private thoroughfare when the proceedings were started, but later it was decided to and was accepted by the city, making it a public thoroughfare. The owners of the abutting property claimed damages through an alleged ownership to the center of the street in front of their lands. Deeds of original ownership in the street rather complicated matters. The present proceeding was to set aside the order confirming the report and to have the commissioners appraise the damage to their property. Justice Mills decides that there was a technical wrong committed when the commissioners failed to notify the abutting property owners of the intention to file the report and to make the motion to confirm the report, and for that reason he would vacate the order confirming the report. In any event, the justice says, the owners would be entitled only to nominal damages, and on that account it would be useless to send it back to the commissioners for correction in that respect. Therefore he vacated the other order, and confirmed the report as of the present date, the owners having now received notice.

Civic Club Plans War on House Fly

Philadelphia, Pa.—Prof. F. D. Weidman, assistant professor of pathology at the University of Pennsylvania, delivered a lecture before the Civic Club last week on the disease-breeding house-fly. The Public Health Committee of the Civic Club has arranged to have the lecture given in some 30 different places in and about Philadelphia.

New Pumps Installed at Sewage Plant

Providence, R. I.—The sewage pumping plant is completed except for some minor touches, the installation of the last of the centrifugal pumps being finished last week. The plant is now ready for any emergency. The work of changing over the old system to the new centrifugal pumps was accomplished in the face of much difficulty, as it was possible to discontinue but one of the old pumps at a time in effecting the change, the others being required for service in taking care of the sewage of the city. They were so worn that it required extraordinary work to cope with the volume that came down the big trunk sewers in time of storm and at times exceeded their capacity and flooded the plant. With the installation of the first series of the six centrifugal pumps, however, the demand on the old pumps was not so severe, as the new system proved itself beyond its rated capacity and amply able to handle the large volume of sewerage easily. Thus, when the work on the second installation was begun, the first centrifugal and the third old pump were able to care for the sewage. The third centrifugal was installed and placed in operation last week, the rope drive being completed and tested successfully. The rebuilt plant now comprises the three engines which were retained from the old system, each of which drives two new centrifugal pumps. As for the efficiency of the new plant, the City Engineer, Otis F. Clapp, states that about two days ago during the severe storm, two of the engines were set at work for an hour and had no difficulty in handling the rush of water through the storm sewers, attaining in that time the notable rate of 87,000,000 gallons per day.

Davenport Plans to Buy Water Works

Davenport, Ia.—One of the preliminary steps in the negotiation for the proposed sale of the Davenport Water Company plant was taken when F. E. Tearneure, dean of the engineering college of the University of Wisconsin, arrived to make appraisalment of the value of the plant.

Filtration Plant to Be Installed

Ogdensburg, N. Y.—Following the inspection of the Albany filtration plant by George E. Van Kennan and other officials of Ogdensburg, Common Council has awarded contracts aggregating \$175,000 for the installation of a system of slow sand filtration. Besides supplying the city with water the new plant will pump 500,000 gallons of water daily for the St. Lawrence State Hospital.

Muskegon in Grip of Water Famine

Muskegon, Mich.—A water famine has assumed alarming proportions in Muskegon. The intake pipe leading into the lake is clogged with sand and it is possible to get scarcely any water in the mains, and in the lower levels of the city there is a pressure of only six pounds. On the high lands and in outlying parts of the city there is none at all. The normal pressure maintained is 40 pounds, the fire pressure being much higher. The city has borrowed another engine for an emergency and an effort will be made to obtain another one. Engineers say it will be impossible to clean out the mouth of the intake pipe until Lake Michigan is calm. The lake is rarely in this condition at this time of the year and there is no prospect of relief. It is feared that insurance companies will declare thousands of dollars worth of policies void if something is not done. The authorities are afraid to turn water from Muskegon Lake into the mains because of the impurity of the lake water, but this will be done in case a serious fire breaks out.

New Filtration Plant Near Completion

Norwich, Conn.—Last week the filters arrived here from Darby, Pa., where they are manufactured by the Roberts Filter Company. Arrangements have been made by the company with a local truckman to cart them to the pumping station, where they will be set up as soon as possible. Each filter is 8x20 feet and will be filled with the material required in filtration after they are in place. The foundations are ready and the filters ready to be moved as soon as the workmen are ready for them. Their arrival was as early as they had been expected, having been nine days on the way. The company has full charge of them until they are set up and ready for use, which will take from one to two weeks.

May Abandon Reservoir Because of Crawfish

Frederick, Md.—The presence of crawfish in the Frederick reservoir will probably cost the city \$22,000 to repair leaks made by their boring, and the abandonment of the reservoir may follow. The great leakage of water from the reservoir has been assigned to the presence of crawfish by engineers, and it is thought that about 100,000 gallons of water are daily going to waste.

Work to Be Resumed on Lake Altoona

Altoona, Pa.—R. J. Carothers, head of the Carothers Contracting Company, which is constructing Lake Altoona, has arrived at the scene of operations, and work will be started as soon as the weather permits. Mr. Carothers will give the work his personal attention during the ensuing summer and every effort will be made to complete the contract before fall. The present contract chiefly involves the core wall and the embankment. The reservoir will not be completed by the contract with the Carothers Company, but it will be so far completed that it can be put in service, and half a billion gallons of water can be stored in it. This it is expected will place the city beyond danger of water famine after this year, and the officials of the water department do not anticipate the trouble this year the city experienced during 1909 and 1910, as there has been a much larger precipitation throughout the winter and the flow of the streams is unusually heavy. Both reservoirs are constantly overflowing from four to six inches.

City Endeavors to Buy Water Plant

Covington, Ky.—At a meeting of the Covington Board of Water Works Commissioners last week the director of the Kenton Water Company reported that the offer of \$26,331.45 made to them by Council for their entire plant which is now supplying water to former Latonia, was not enough, and they ask \$36,673. The offer was made by the city after experts had reported that the plant as it stood was worth that amount. It is not believed that Council will increase their offer, but will order the commissioner to proceed to lay water mains in Latonia.

Meter at Filtration Plant.

Providence, R. I.—The City Engineer's department will install an eight-inch Venturi meter in the main pipe leading from the Pettaconsett pumping station to the filter bed for the purpose of measuring the amount of water sent through the filters daily. Up to the present time the city has estimated the amount, but it is now believed desirable to keep an accurate series of figures. Two small meters will also be installed at the pumping plant, one in the laboratory and the other in the screen chamber of the engine room. In this way an accurate measurement of the water for all purposes can be secured and filed for compilation in the reports of the department.

STREET LIGHTING AND POWER

Lighting Experts Examine Property

Los Angeles, Cal.—Work preliminary to fixing the lighting rates to be charged by the different electrical corporations has been begun in earnest by the experts engaged by the Board of Public Utilities, who are at present going over the plant of the Southern California Edison Company. The board is going into the rate-fixing question in a thorough manner, and instead of accepting the figures of the corporations will be furnished with first-hand information gathered by its own engineers.

Gas Company Asks City's Help in Adjusting Differences

Spokane, Wash.—Asking the City to take a hand in adjusting the differences between the company and its gas consumers, the Spokane Falls Gaslight Company has recommended to the city commissioners that a complete meter proving apparatus be installed at the city hall. To make this apparatus the last "resort" of consumers who kick to the company that their meters register more gas than they use, is the plan of the company.

Cuts City's Light Price

Cincinnati, Ohio—Cincinnati will be given its electric lighting contract by the Union Gas & Electric Co. several dollars per lamp per year cheaper than the price in Cleveland. The bid, which has just been opened, states that the company will give the city its lighting in the "overhead" district for \$50 per lamp per year and in the "underground" district for \$55 a year. Cleveland pays \$53.75 for its "overhead" lighting. No figures are obtainable here as to the "underground" cost. The taxpayers of Cincinnati will save \$66,000 a year for each of the ten years this contract is to run, or \$660,000 in all.

For Municipal Gas

Portland, Me.—The socialists of this city are agitating for municipal ownership of the gas works and will make it a part of their educational campaign until the next municipal election and one of their local issues.

Accident to Light and Power in City Hall

Chicago, Ill.—The new City Hall had its first dark experience last week. For half an hour before 10 a. m. the building was in gloom, the elevators were stuck between floors and the main corridor filled with excited persons who groped about in the dim light furnished by two gasoline lamps. All the trouble was caused by the burning out of the main feed cable of the Commonwealth Edison Company leading into the building. This furnished the electric power for lighting the building and running the elevators. It was repaired in comparatively quick time, a large force of electricians being put at the work, but for a time it was feared that the cable was broken and that the damage could not be fixed up during the day.

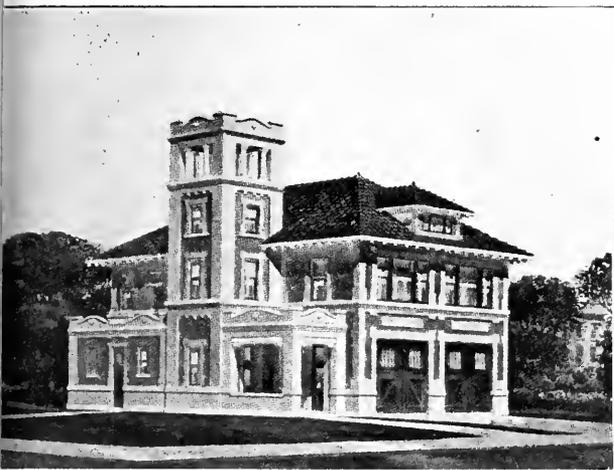

FIRE AND POLICE

Will Pay Fire Department

Anderson, S. C.—City Council adopted an ordinance looking to the reorganization of the fire department. The old system of a volunteer department was abolished. W. L. Jackson, fire driver, was elected chief to give his full time to his duties. The department will consist of 18 men, exclusive of the chief and the three drivers. These men will be paid stated annual salaries, which will be supplemented by extra pay for each fire call. The 18 men will not give any of their time to the department but will answer the fire calls from their respective jobs. The effect of the ordinance is that Council will take over and completely control the fire department.

Fire House with Police Station as Annex

Hamilton, O.—The illustration shows the new Linden-wood hose house and is duplicated in the East Hamilton hose house, both nearly finished. Each house will be equipped with a hose wagon, two horses and four men. The houses will be the best equipped in the department and will carry 500 feet of hose with chemical extinguishers, ladders, etc. There will be hose racks in the basement for drying. The

Courtesy Hamilton News.

NEW FIRE STATION, HAMILTON, O.

ground floor will be cemented and will be occupied by horses and apparatus. There is space for a new truck in each, to be purchased later, possibly an auto truck. There will also be an office, toilet rooms, lockers and a place of detention for police prisoners. This will contain two steel cells. On the second floor is the dormitory, lounging room, baths, etc. The houses cost with land \$40,000 each. Safety Director A. W. Marged will select men for the new houses.

Auto Ambulance Placed in Commission

Dayton, Ohio—With the delivery last week of the new ambulance to city officials the emergency equipment of the police department was brought up to the efficiency of any city in the country of its size, and surpassing many larger. The receiving party was composed of Mayor Burkhart, Director of Safety Lienesch and Chief Allaback. The ambulance was taken to headquarters and officially turned over to the city. A test ride was taken over the hills south of the city, and perfect satisfaction was the verdict. The machine is equipped with the most modern devices, including electric light, hot and cold water, and emergency electric lamps to be used at accidents where no other lights are available. The cost of the ambulance was \$4,050.

City Makes Splendid Fire Record

Topeka, Kan.—The fire loss in the city of Topeka for the last 20 years, ending December 31, 1910, amounts to \$1,429,162. The value of the property under risk in these fires has been placed at \$16,636,162. The insurance involved reaches near the ten-million mark. In these 20 years 3,495 fire alarms were turned in to the stations in Topeka.

Buy Police Dogs

Houston, Tex.—Chief Ray of the Houston Police Department has purchased eleven trained dogs, which will be kept at the police station. The main purpose of the dogs is to trail the burglars that have been operating frequently in this city, providing their work is not stopped. A try-out in three runs proved the efficiency of the dogs.

Entire Fire Department Resigns

Bloomington, Ind.—The resignations of all the members of the city fire department were accepted last week at an adjourned meeting of the City Council and the organization of a new department started. William Shinn, an expoliceman and former fireman, is to take Chief Frank Todd's place and Perwic Deckard is to replace Assistant Chief James Durnall. The present fire department tendered their resignation when the Council refused to increase their pay.

Trial of Fire Apparatus Satisfactory

Lansing, Mich.—A new motor fire engine has stood several preliminary tests and has been accepted by the city.

GOVERNMENT AND FINANCE

Tarrytown Election Carried by Women

Tarrytown, N. Y.—Tarrytown will have \$70,000 to enlarge its water supply and lay new mains for fire protection, and Washington Engine Company will have a new \$5,550 auto combination fire apparatus, thanks to the women voters. Never before in the history of the village have women taken such an active part in a campaign. They were only enlisted in the fight six days. On March 15 the Women's Civic League held a meeting at which they asked D. S. Merritt, engineer for the Water Board, to deliver an address on Tarrytown's water supply and its needs. Mr. Merritt told of the need of a better water supply so well that after he finished the women crowded around him and pledged their support for his plans. The next day women were being buttonholed on the street by enthusiastic workers. Nearly every woman in Tarrytown was visited, and a notice was published calling on the women to get out on election day and do their duty. They heeded the call enthusiastically and out of a total of 309 votes, the women cast more than a third of them.

Bill Will Protect City Bond Buyers

Lebanon, Pa.—To doubly validate the \$110,000 worth of bonds issued by the City of Lebanon to pay for sewer improvements, Representative Wm. C. Freeman, of Cornwall, last week introduced in the House at Harrisburg a bill making them absolutely legal. There is no doubt whatever of the passage of the bill. This precaution—which, by the way, was taken at the instance of none of the three banking institutions in this city which bought blocks of the bonds—makes assurance doubly sure that the bonds are good. It makes the legality of the bonds absolutely sure, double riveted and ironclad. The bill was introduced at the instance of private buyers of the bonds, it was stated.

Draw Lots for Office

Newburg, N. Y.—After a bitter contest in Highland Falls for Village President between George W. Flood and J. S. Likely, a tie vote resulted. To avoid the expense of another election the two candidates agreed to draw lots for the office. Slips of paper were put in a hat and Flood drew the winning ticket.

City Wins Franchise Suit

Denison, Tex.—In the case of the City of Denison vs. The Postal Telegraph and Cable Company of Texas, wherein the City of Denison sued for a franchise tax for the year 1910, Justice of the Peace I. N. Layne last week rendered a decision in favor of the City of Denison. This is one of the four suits which were filed several weeks ago by City Attorney N. H. L. Decker for the collection of the franchise tax of \$74,288, penalties, interest and fees and cost of suit. D. A. Frank of the Postal Telegraph Company legal department represented the company, and Mr. Decker the City of Denison. The evidence in the case was heard Saturday and Justice Layne rendered his decision Monday afternoon.

STREET CLEANING AND REFUSE DISPOSAL

New Flushing Machine

Schenectady, N. Y.—The new street flushing machine for the city has arrived. It is of iron, with a capacity of 653 gallons, three more than called for in the specifications. As soon as the weather permits it will be put to work, together with the old one, flushing the streets. The new street sprinkler has not yet arrived, but the old ones are in commission, and with the rotary broom wagons received their new numbers from the hand of a painter in the city hall lot.

Garbage Crematory Closed

Waterbury, Conn.—H. M. Rigney's contract with the city for the disposal of the garbage at the crematory on Sheffield street has expired. Consequently there will be no more garbage disposed of in Waterville. The garbage will be disposed of by Hans Rasmussen and sub-contractors for the next year. Mr. Rigney, who has been a resident of Waterville for many years, has had the contract for over twenty years. Those employed at the crematory by Mr. Rigney have been thrown out of employment by the shifting of the contract.

Flushing Machine for City Arrives

Poughkeepsie, N. Y.—The clean streets of Poughkeepsie will be cleaner still and that state next to godliness will be secured with a deal less effort than has been expended before this time. A new flushing machine, weighing 4,000 pounds, which is said to fairly eat up the dirt, arrived in Poughkeepsie last week. It is white, with "Department of Public Works" in black, red-lined letters. The machine has been taken on trial and will not be finally accepted until its worth has been proved. A demonstration will be given by men from the Tiffin Wagon Company, of Tiffin, Ohio.

Cheaper Flushing Asked for Streets

Spokane, Wash.—Commissioner of Public Works Coates states that he will ask the commissioners to send him to Seattle to investigate a new system of street flushing. The system, if adopted, will supplant the present pressure flushing wagons used downtown and on paved streets elsewhere in the city. If found efficient, it will save considerable expense. The system is to flush the streets from the hydrants instead of from the carts, using length of 2-inch steel pipe mounted at each end on 4-inch swiveled wheels, the lengths of pipe to be connected together by pieces of heavy, steel-ribbed fire hose. Mr. Coates says two men can flush a block with this outfit in 10 minutes at much less cost than under the present system. A horse is used to drag the outfit from block to block.

Must Carry Refuse Far Out Into Ocean

Sacramento, Cal.—Harland's bill prohibiting the deposition of garbage and refuse in navigable waters was passed by the Senate and goes to the Governor. Senator Martirelli said that the object of the bill was to relieve residents of Marin county from the nuisance caused by the dumping off the Heads of all sorts of trash, rubbish and offensive matter. The bill provides that the scows and other craft carrying garbage out on the Pacific Ocean must go not less than twenty miles off shore before unloading. Inspectors appointed by the State Board of Health or the municipality at the point of departure must go along to see that this is done.

Garbage Plant Ready for Opening

Bridgeport, Conn.—Delay in the arrival of machinery for the garbage plant is responsible for its not being able to open for receiving the city garbage until April 15. Commissioner Frank Bogart of the Health Board was informed by Contractor C. C. Fischer that he expected the plant will be ready at that time. It is expected that the contractor will have a model plant when everything is ready for the opening and no expense is being spared. His contract which calls for payment of \$1 per ton for the reduction process is considered to be an excellent one for the contractor and, provided he can keep his contract by having an odorless plant, it is expected that he will be able to make his venture a profitable one.

Plan for Cleaner Streets

Elizabeth, N. J.—The problem of keeping clean ninety-seven miles of paved and unpaved streets in Elizabeth is the puzzle facing the Committee on Streets Highways of City Council. The Committee, composed of Councilman McGurn, chairman, and Councilmen Maughan and Wagner, has been giving the subject the utmost consideration for weeks and has gone over many plans that have been suggested to the committee, by Mayor Stein and others. No plan has been adopted as yet, but Chairman McGurn is of the opinion that a satisfactory method will be discovered and that the streets will be kept clean watered at a minimum cost.

The plan of street cleaning as suggested by Mayor Stein is: That the work be divided into districts, with a competent foreman at the head of each district, said foreman being held accountable for his district work; that the principal business streets be swept at night; that the sprinkling wagons be assigned to each district and be kept busy during the dry season of the year; that the employes be placed in uniform, as are the police and firemen; that a certain sum be set aside annually to be used exclusively for the repair of paved streets, so that minor repairs can be made as soon as their needs are discovered, without causing a general fund for street cleaning to suffer; that the ordinance providing for the removal of snow from sidewalks and the throwing of paper, etc., into the streets should be more rigidly enforced, and that the necessary appropriation for oiling the streets be made early so that the streets can be oiled in the early summer months as soon as the roads become dusty.

To Investigate City Garbage Methods

Niagara Falls, N. Y.—City Engineer F. S. Parkhurst, has been authorized by the Board of Public Works to investigate cities using sanitary methods for the disposal of garbage and make a report to the Board at the earliest possible date. It is the intention of the city to stop the pollution of the Niagara River by discontinuing the dumping of refuse into the water. By this means it is believed that the city will be taking the first step in stopping the pollution of the Niagara and that the State Board of Health will take steps to prevent Buffalo and the Tonawandas from dumping its sewage into the river above the falls. The disposal of garbage by incineration is said to be the best method, and the taxpayers may be called upon in a short time to vote on the purchase of such disposal plant. The cost of a disposal plant sufficient to take care of the city refuse is estimated at about \$75,000.

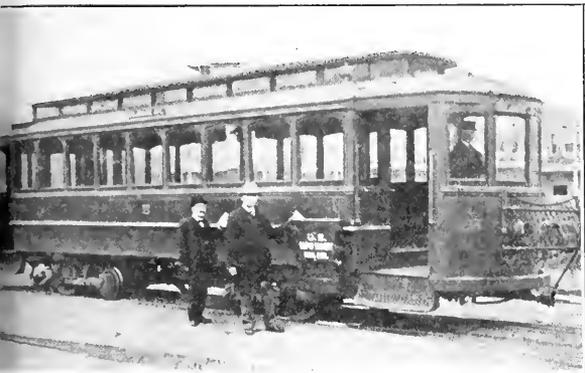

Spring Cleaning a Step in City Beautiful Plan

Toledo, O.—There will be a monster housecleaning May day for which everybody in Toledo will want to get called early in the morning if the plans of the proposed Civic Federation, already numbering 2,500 members, go into effect as suggested at the meeting of many of the committees of the city at the Business Men's Club last week. It is confidently expected that the federation will embrace 5,000 members when organized. With the idea of the City Beautiful in mind, Colonel J. C. Bonner, acting as chairman of the meeting, spoke of the necessity of rendering the city and the hygienic aspects of the city attractive to prospective settlers. On May day every storekeeper, housekeeper and manufacturing concern in the city will be asked to put its house in order, and explore garret, cellar, lumber shed and yard for the things which are unnecessarily cluttering the earth. These will be deposited in front of the premises and collected and taken to a scow, which will be far out upon the lake, where the rubbish will be deposited. The sign of the citizens desirous of perfecting the City Beautiful will be a pile of debris on May the first. It will be a badge of honor on that day. The day set by the federation as that on which the City Beautiful idea should be completed is that of the Perry Centennial celebration, September, 1913. The grocers, the butchers, the bakers, the candlestick makers of Toledo will all be invited to load their wagons for the removal of the proceeds of the sale after forgotten and unsightly things on May day. Among the measures advocated for the promotion of the City Beautiful will be the paving of all streets, the growth of more shade trees and the education of citizens as to the things they ought and ought not to do.

RAPID TRANSIT

Satisfactory System of Street Car Mail Boxes

Washington, D. C.—If negotiations now pending between the Post Office Department and the street railway companies are successful, letters may be mailed in boxes attached to the sides of the street cars and their outward reach greatly facilitated. Various plans have been tried in the department to perfect a system of rapid mail collection. In some cities where postal cars are operated on the street railways letter boxes have been provided on the mail cars and the mail dropped in them has had the immediate attention of the postal clerks. Such a plan was tried in this

Courtesy Washington Star

NEW PLAN OF ATTACHING MAIL BOX TO CAR

for a while. The new plan, however, is said to be much more effective and satisfactory. It contemplates the attachment to the side of the street car of a mail box with a large funnel-shaped mouth, into which letters may be easily deposited when the car stops at the corners or the motor-slackens speed as it passes. The box is so constructed that neither snow nor rain can damage the letters deposited in it, and yet its mouth is always wide open. Provision is made whereby letters gathered on lines that do not connect with the postoffice may be transferred at junctions with other lines and without delaying the rapid transit of the cars or interfering with their schedule. The plan is said to have been tried in Wilmington, Del., for several months and to have been so successful and satisfactory in every respect that the Mayor and Common Council ordered the postmaster in extolling it to the department and for its continuance.

Improvements to Street Cars

Louisville, Ky.—Street cars on Louisville city lines may be timed hereafter by clocks instead of inspectors. Three such clocks are already in use and President Minors says that they have proven so uniformly satisfactory that they will be used on the entire system in a short time. Clocks now in use are located at Fourth avenue and Oak street and at Second street and Broadway. The clocks are connected with the trolley wire by a small electric wire and when the car on any line reaches a given point the contact wheel coming in contact with the small wire puts in action an electric current that causes a needle to register on the face of the clock the exact second the car reaches that point. It is stated that it will be only about ten days before motormen on every car line in the city will be equipped with stools. They have already been introduced on the Second street line. This innovation is introduced on the suggestion of Mayor W. O. Head. The commissioner has found some difficulty in finding stools small enough to keep from obstructing the small spaces in the vestibules.

Fender Ordinance Goes into Effect

South Bend, Ind.—Safety appliances, similar to those in use in the large cities, have been placed on city cars of the Northern Indiana Railway in South Bend, and will serve as a protection against fatal accidents. An ordinance passed by the Common Council providing for the equipment of cars with proper safety appliances became effective last week.

To Limit Street Car Loads

St. Paul, Minn.—Without a dissenting vote the Aldermanic Committee on Streets last week recommended Alderman Corning's "strap-hanger" ordinance for passage. The ordinance provided the maximum carrying capacity of any car shall be the number of passengers the car may seat, plus one-half that number, who will be permitted to stand. When the maximum carrying capacity has been reached there must be displayed in a conspicuous place at the rear of the car the sign "Filled," and no more passengers may be permitted on the car until other passengers leave the car. A penal clause is attached. It is further provided the company must furnish enough cars so no patron will be required to wait more than three minutes for a car on the lines of heaviest traffic and not more than ten minutes for a car on all other lines in the city. A penalty attaches to violation of this provision. It is likely, however, this provision will be amended, making the waiting time uniform.

Improvements Must Be Made in Street Car System

Seattle, Wash.—The radical actions of the newly elected reform City Councilmen have caused a sensation here. The Council has gone on record to investigate immediately how many miles of tracks the Seattle Electric Company is operating over without franchise, and if such are asked for and now granted they must be paid for. The Council will put an end to strap-hanging by making new schedules and forcing the purchase of new equipment. Its most radical action was the setting of the date of April 25, when the Seattle Electric Company must show cause why its Ranier avenue franchise, a line that will tap the populous Ranier Valley, should not be repealed. The voters at the same election in which they elected the reform candidates having voted a bond issue of \$800,000 to build a line along Ranier avenue, leads shrewd financiers to believe the franchise will be repealed.

MISCELLANEOUS

Voters Reject Library

Wellsville, N. Y.—By a majority of 74 votes, at the village election, last week, the town of Wellsville, N. Y., voted down the proposition to accept the "David A. Howe Public Library." It is understood that the vote was the result of a misunderstanding, the people believing that conditions were attached to the gift.

Dog Ordinance Passed by City Council

Jacksonville, Fla.—As the result of several cases of hydrophobia in the city a bill has been passed stipulating that every person owning a dog must register the animal with the City Recorder and shall be subjected to a tax of \$1 for each dog. The bill also provides that metal tags shall be attached to a collar, denoting the number of the license. Owners allowing their dogs to run at large are required to have them muzzled and when a dog accompanies a person on the streets of the city he must either be muzzled or must be led by a chain or leash. The appointment of dog catchers to impound animals not muzzled or failing to comply with provisions of the ordinance is vested in and the period of their service is discretionary with the Mayor. The ordinance further stipulates that all dogs taken up shall be held for five days. Owners of dogs which are tagged shall be notified of their being impounded and every opportunity given them to claim the animals. After being held five days unclaimed dogs will be killed.

Trimming of Trees Ordered in Garwood

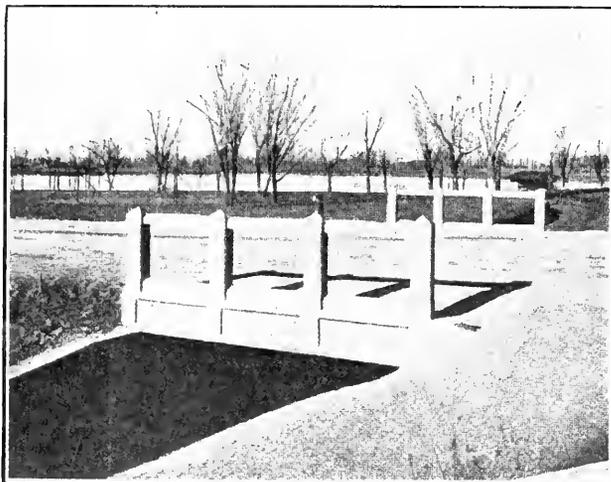

Garwood, N. J.—Councilmen J. L. Hildner, H. M. Bull and H. M. Wyckoff, constituting the street committee of the council, have sent out notices to all property owners to trim trees in compliance with the borough ordinance. The notice informs property owners that the committee takes the opportunity of notifying each owner to trim trees so that the same will not interfere with the free passage of pedestrians or the obstruction of electric lights in accordance with Section 7 of ordinance No. 1. The committee gives the owners ten days' time to comply with the terms of the ordinance.

Plans Launched to Free Bridges

Columbus, S. C.—Plans for "freeing" the bridges across the Congaree and Broad Rivers were discussed at the organization meeting of the commission named by Governor Blease to have charge of the work. The members of the commission were commissioned following a report to Governor Blease by the election commissioners that the election held in Columbia township for the issue of \$75,000 in bonds, was provided for by an act passed in 1908. At the meeting it was decided to confer with the owners of the present bridges across the Congaree and Broad Rivers. The bridges will be bought if a reasonable price is fixed. Before making a purchase an expert will examine the bridges for the commission to determine the safety of the structures.

Concrete Bridges in Denver Parks

Denver, Col.—The Park Board is completing the construction of four concrete bridges, spanning the City Ditch which borders the Marion street driveway through Wash-

SHORT SPAN CONCRETE PARK BRIDGE

ington Park. The work is being done under the supervision of Frederick C. Steinbauer, superintendent of parks. The bridges are of ornamental design and will add considerably to the beauty of the park.

Municipal Ownership Makes Good Showing

Calgary, Alberta.—The City of Calgary, Alberta, owns and operates the street railway, water works and electric light plants, which are operated by a commission of three. During the five years that the electric plant has been under municipal control the rates have been reduced 45 per cent. The street railway has been operating about eighteen months, and contracts have been let for 22 miles of new track this year. The water works plant was purchased from a private company several years ago in a very dilapidated condition, since when it has been largely reconstructed; 19½ miles of mains having been laid in 1910. This plant has cost about \$1,400,000. The electric plant has cost about \$500,000, and the street railway about \$530,000. During 1910 the net surplus was \$3,335 for the water works, \$22,407 for the lighting and power plant, and \$33,315 for the street railway. In figuring these profits allowance was made for interest, sinking fund and depreciation, except that apparently no depreciation is charged off for the water works. The interest rates are from 3 to 4½ per cent., and the sinking fund about 1.6 per cent. for the water works and 1.8 per cent. for the other two.

City After Record for Improvements

Richmond, Ind.—The city is going after a record this year for public improvements in contrast to last year's inactivity. So far this year, according to Everett Davis, Chief Clerk of the Engineering Department, contracts for \$83,000 of public improvements have been let. Mr. Davis says there is about \$30,000 worth of contracts for improvements to be let.

City Planners Organize to Beautify City

St. Paul, Minn.—St. Paul's city planners believe the public will support their projects for civic improvements, and the City Club last week launched a campaign for the organization of a gigantic "civic trust," the object of which will be to obtain the consummation of the projects now planned. Every civic organization in St. Paul will be invited to become a member of the City Club. Such membership will entitle the organization to five delegates, president, secretary and three other members in the club's civic council. The civic council will be an executive committee of the "civic trust," which will comprise the total membership of all civic organizations when it comes creating sentiment for civic improvements. This is a most important step as it assures uniformity of plans.

Law Prohibiting Sidewalk Obstructions Will Be Enforced

Port Arthur, Tex.—Removal of board signs and merchandise displayed on the sidewalks will be strictly insisted upon, and those who fail to take heed and obey the edict will be prosecuted. The city authorities have determined to strictly enforce the law prohibiting the placing of the board signs on the sidewalks, likewise the obstruction of the walks in other ways. Chief of Police Taylor, acting under instructions of the Mayor and Council, is making canvass of the town and notifying the merchants and others of this fact, giving them due warning that unless the law is obeyed arrests will follow.

Dynamiting Municipal Building Does Little Damage

Springfield, Mass.—An attempt to blow up the tower of the new municipal group of buildings with dynamite resulted in slight damage. The contractor said when asked that 100 bricks and a few hours' work would put it in good shape as ever. Five hundred dollars reward is offered by the city for the arrest and conviction of the person responsible for the explosion.

Will Plant 60,000 Trees

Washington, D. C.—The school children of Washington will contribute their efforts toward making Washington "City Beautiful" on Arbor Day by planting about 50,000 catalpa trees. These trees are to be given to the public and private school pupils by Woodward & Lothrop, the only stipulation being that the planter must take care of the tree. Not only will 50,000 be distributed in Washington, but about 10,000 more will be distributed in the vicinity. The catalpa, or "Indian cigar," reaches maturity within a few years, and because of its rapid growth a very durable wood, which has been described as being "lighter than pine, stronger than oak, and tougher than hickory," is recommended by the United States for service for general planting. Besides its rapid growth, the catalpa is valuable for city use because it is a flowering tree, bearing beautiful white blossoms, spotted and lined with brown and purple.

Money Is Divided Among City Parks

Richmond, Va.—After two hours of cutting and pruning a subcommittee of the Council Committee on Grounds and Buildings last week distributed between the various parks of the city the general appropriation of \$25,000. The report will be made to the Grounds and Buildings Committee next week. The slate as adopted is as follows: Chamberlayne Park, \$2,950; Marshall Park, \$2,000; Jefferson Park, \$1,000; Taylor's Hill, \$1,000; Steps, Twenty-sixth street, \$20; Gamble's Hill, \$900; Monroe Park, \$1,200; Nurse Park, \$1,200; Riverside, \$1,000; William Byrd, \$8,900; Monument Avenue, \$900; Washington square, \$700; Contingent fund, \$100; Water and Light, \$700; Joseph Bryan Park, \$2,400. These funds are for improvements, and are aside from the pay of keepers and laborers.

Only Bonded Persons May Do Pipe Fitting

Spokane, Wash.—An ordinance prohibiting any plumbing and gas fitting in the city except by persons and firms filing a \$5,000 surety bond was one of the last passed by the City Council. It was framed by the master plumbers of the city and passed, according to Plumbing Inspector E. R. Rife, without his recommendation and even without his having time to go over it. Permits will be required for all work except removal of stoppages or repairing leaks and a few other minor jobs of repairing.

LEGAL NEWS

Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Patented Paving Materials—Statutes

Tousey v. City of Indianapolis et al.—Burns' Ann. St. 1908, relating to towns and cities, provides that a board of public works shall let a contract to the lowest and best bidder; section 8710 relates to the determination by voters by the Council of the kind of material to be used in a street improvement. A corporation having patent rights in a paving material called bitulithic proposed to grant to the city, or to any accepted bidder for paving work, the right to use it for a specified royalty, conceded to be reasonable, the city to have the use of such right for repair of improvements for which the contracts were let during 1908. The city accepted the proposition and after a petition under section 8710, requiring the use of bitulithic, prepared specifications calling for bitulithic paving, specifying that the rights conferred by the company were granted to any contractor at the same rate. Held, in an action by a taxpayer to enjoin the letting of the contract, that the use of the patent rights provided in the specification was not an interference with the competition contemplated by the statute. Supreme Court of Indiana, 94 N. E. R., 225.

Improvements—Description—Sufficiency

City of Hillsboro v. Grassel.—Where blue prints of the plans of a local improvement were before the Council, and considered as part of the ordinance at the time of its passage, temporary detachment from the ordinance did not invalidate the ordinance. Under Local Improvement Act, requiring an ordinance for a local improvement to describe the improvement, etc., plans, profiles and specifications attached to the ordinance made a part thereof by reference as much part of the ordinance as if bodily incorporated therein.—Supreme Court of Illinois, 94 N. E. R., 48.

Park Commissioners—Power to Make Improvements

South Park Commissioners v. Pearce et al.—Under the Revised Statutes, 1909, authorizing park commissioners to improve streets under their control by special assessment, an improvement is not precluded merely because the street has been improved by the city, but good pavement, sidewalks, curbs and gutters recently put down at the abutter's expense cannot be replaced at the abutter's expense, with substantially similar improvements, slightly changing the details to better adapt the street as a pleasure driveway.—Supreme Court of Illinois, 94 N. E. R., 33.

Public Officers—Compensation

Amerige v. Town of Saugus.—There is no such relation between a public officer and a municipality in and for which he is elected or appointed as to entitle him, merely by reason thereof, to compensation.—Supreme Judicial Court of Massachusetts, 95 N. E. R., 297.

Highway Construction—Landslide Damages

Giaconi v. City of Astoria.—In an action against a municipality for damages to land caused by a slide of earth in opening a road where defendant had the services of a competent engineer, and, in running the cross-section lines to determine the amount of cut and fill, he examined the ground where the improvement was to be made, and prepared specifications based thereon, and no slide had ever been known in that vicinity, and he was never informed of the existence of a fissure therein, his judgment respecting the plan was all that reasonably could have been required from an inspection of the conditions, and the city was not liable.—Supreme Court of Oregon, 113 P. R., 855.

Defective Sidewalk—Negligence

Preiss vs. City of New York.—In an action to recover for injuries sustained by one who stumbled over the end of an iron pipe projecting about 2½ inches above a cement sidewalk it is a question for the jury whether the accident was reasonably to be apprehended.—New York Supreme Court, New York, 127 N. Y. S., 498.

Commission Government—Statutory Provisions

Walker v. City of Spokane et al.—The city of Spokane, a city of the first class, having the right, under Constitution, to frame its own charter subject to control by general laws, prepared and proposed a charter abolishing the offices of Mayor and the Council and substituting five Commissioners, who were to exercise all municipal powers, both executive and legislative, and to be subject to the order and direction of the people by the initiative, referendum and recall provisions. Held, that the provisions of the proposed charter were "within the realm of local affairs or municipal business," within Laws 1903, providing that charter amendments as to any matter within such realm might be submitted to the voters for adoption as part of the charter.—Supreme Court of Washington, 113 P. R., 775.

Defective Street—Injury—Notice

Anthony v. City of St. Joseph.—Where the notice, required by Rev. St. 1899, to be given to the city in case of injury to a person by a defect in the street, stated that the accident occurred on the 14th of August, when the petition and evidence showed that it happened on the 13th, the variance was fatal.—Kansas City Court of Appeals, Missouri, 133 S. W. R., 371.

Grading Streets—Action on Bond

Kansas City v. Davidson et al.—In an action on the bond of a contractor for grading a city street by owners of two tracts of land for breach of the contractor's agreement to grade lots in consideration of the right to remove dirt from such tracts for filling purposes, there could be no recovery where it does not appear what was the quantum of damages suffered by each plaintiff on account of the breach.—Kansas City Court of Appeals, Missouri, 133 S. W. R., 366.

Defective Streets—Injuries to Children

Townley vs. City of Huntington.—A space within the bounds of a city street, set apart between the sidewalk and the roadway for a grass plot, is a part of the street, for the neglect of the safe condition of which the city may be held liable. A street or sidewalk is not in good repair when one without fault may fall from it into a dangerous hole, or an irresponsible child may venture to an unguarded pitfall within its bounds or immediately at its side. A city owes substantially the same duties to children, properly on the streets, although engaged in play, as it does to travelers on business.—Supreme Court of Appeals of West Virginia, 70 S. E. R., 368.

City Advertising—Incidental Expenses

Mitchell vs. City of St. Paul et al.—The term "current and incidental expenses," as used in St. Paul Charter, 1905, means the usual and reasonably necessary expenses, not otherwise provided for, of carrying into effect the powers and discharging the duties given and imposed by the charter. Advertising the city is not a current and incidental expense, but one which is payable only out of the contingent fund of \$10,000 for promoting the welfare of the city.—Supreme Court of Minnesota, 130 N. W. R., 66.

Telephones—Permits—Franchises

East Tennessee Telephone Co. v. Board of Councilmen of City of Frankfort.—A permit to a telephone company to use the streets of a city given by resolution is not a franchise. It is only a license, and may be withdrawn; but, where extensive improvements are made upon the strength of it, it can only be revoked upon reasonable notice to remove the property or to acquire a new franchise.—Court of Appeals of Kentucky, 133 S. W. R., 564.

Defective Sidewalk—New Trial—Diligence

City of Ft. Worth v. Lopp.—Where diligence exercised by attorneys for a city to discover evidence before trial which was subsequently found and urged as a ground for a new trial had been begun and prosecuted but a short time before the trial, which was some six years after the accident, and there was no legal showing as to what effort, if any, former city attorneys and other city officers had made to secure the testimony, the diligence was insufficient.—Court of Civil Appeals of Texas, 134 S. W. R., 824.

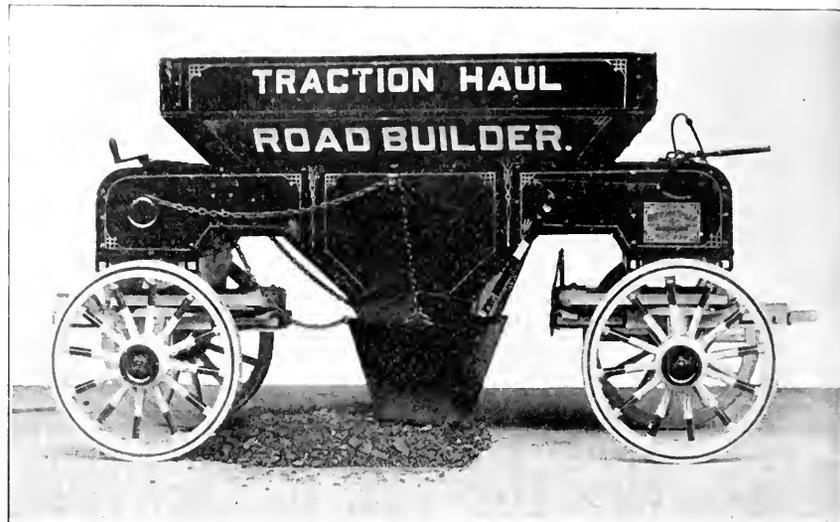

MUNICIPAL APPLIANCES

Street Flushers

AN exhibition of street cleaning machinery was given in New York City, at Eighth avenue and Forty-second street, March 20, in the presence of Commissioner Edwards of the Department of Street Cleaning and other city officials. Machines made by seven manufacturers were shown, among them being the Emerson street sweeper described in these columns, April 5th issue of the MUNICIPAL JOURNAL AND ENGINEER. The street washing machine, perhaps better known as the "squeegee cleaner," made by the Kindling Machinery Company, Milwaukee, Wis., was also there. Street flushing machines, operated by air pressure, created by drawing water from the hydrant into a closed tank until the pressure in the tank is equal to that of the water at the hydrant, were exhibited by the following manufacturers: Sanitary Street Flushing Machine Company, St. Louis, Mo.; St. Louis Flushing Machine Company; D. Conolly Boiler Works, Cleveland, O.; Charles B. Hyass, 509 East Eighteenth street, New York. These machines have been described in the MUNICIPAL JOURNAL AND ENGINEER at various times. They all operate on the same general principle and vary from each other in the details of the flushing nozzle, air arrangements and methods of control. Although the water pressure in the hydrants at this point in New York is only 25 pounds, and 40 or 50 pounds is considered as a desirable working pressure, the machines made a favorable impression.

The most novel machine in the exhibit was the new Studebaker Uniform Pressure Street Flusher, made by the Studebaker Corporation, South Bend, Ind. Although a machine of this general description was placed on the market last year by this company, the

machine exhibited is practically a new design on account of the substitution of a positive pressure for a centrifugal pump. In this machine the flushing is accomplished by the pump driven by a gasoline engine, there being no pressure in the tank.

HAYWOOD 3-YARD WAGON WITH SPREADING ATTACHMENT

In general outlines the machine can hardly be distinguished from the other flushing machines, except by a view of the rear, which shows the housing for the machinery. The flusher exhibited was handsomely painted in green with ornamental stripes and lettering. The tank, which is of steel, holds 750 gallons. This is mounted on a substantial running gear with Sarven wheels and Timken roller bearing axles. The weight of the wagon is

4,500 pounds. The wheels are provided with double roller brakes. The roller bearing makes the apparatus, even when filled with some 5,000 pounds of water, easy to draw when once started. The gasoline engine is a Fairbanks-Morse two-cycle engine of 12 horsepower, such as is used for marine purposes. It is recommended for simplicity and economy. There are no valves, the piston acting as a valve as it passes the ports of a tri-pass valve. The system of ignition is the Atwater-Kent, recommended for reliability and economy. The pump is a positive pressure pump, the pressure being created by two impellers, which operate together without friction. The flushing nozzle is a Studebaker patent fan-shaped nozzle. It is adjustable in any direction by means of clamp

rings and elbows working in combination.

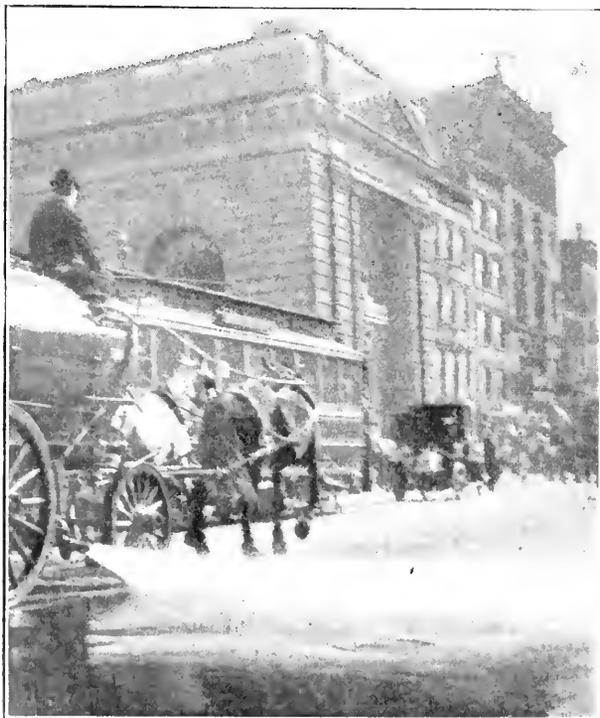

The engine and valve leading to the nozzle is under the control of the driver by means of levers situated by his side. The engine at 725 revolutions creates a pressure of 45 pounds and it can be run at a speed of 900. The valve leading to the nozzle is also controlled by the driver by means of a lever. There is a by-pass from the pump to the wagon so that if the water should be

shut off from the nozzle without stopping the engine the overflow goes back into the tank. The engine runs on the throttle, as the engineers say, so that the pressure can be varied from 5 to 40 pounds.

One tank of water will clean about 1,200 square yards of pavement, more or less, according to the condition of the pavement. If only 20 pounds pressure is needed that is all that has to be used. Five gallons of gasoline is sufficient for eight hours' work. The piping can be so arranged that the tank can be filled from a river or other body of water and the expense of using city water thus avoided.

Three Yard Road Building Wagon with Spreading Attachment

The Haywood Wagon Co., Newark, N. Y., have placed on the market a stone spreading wagon of three yards capacity, which they call a Traction Haul Road Builder. As shown by the illustration the wagon is substantial in construction. Both front and rear wheels turn on fifth wheels so that the wagon may be hauled either way. The construction is intended to be strong enough so that the wagon may be hauled by a traction engine. For this purpose it is made with a traction hitch. The automatic spreading attachment is a steel hopper, the raising and lowering of which is under the control of the driver through levers and chains. A gate at the bottom may be opened as wide as is desirable. The manufacturers claim that the wagon will spread stone or other road material to a depth varying from one inch to two feet and that it will spread its load evenly no matter how rough the road. When the wagon stops the discharge is also stopped. The possibility of saving one or two cents a square yard, the usual cost of hand spreading, makes this proposition an interesting one.

POWERFUL STREAM FROM STUDEBAKER FLUSHING MACHINE

NEWS OF THE SOCIETIES

National Conference on City Planning.—The following program of the third national conference, Philadelphia, May 15-17, has been issued by Flavel Shurtleff, secretary, 19 Congress street, Boston, Mass.:

Monday, May 15—A city planning automobile tour of the city for members of the conference and specially invited guests. Is Honor Mayor John E. Reburn will give a luncheon to members of the conference. First conference session from 9 to 5 p. m. Address of Welcome by Mayor John E. Reburn. Reply by the chairman of the executive committee, Frederick Law Olmsted. Paper, Municipal Real Estate Policies, Frederic C. Howe, New York City. Discussion. It is hoped that experts from England, France and Germany will present the municipal real estate policy of their respective countries. Second conference session from 8 to 10 p. m., under the direction of the Committee on Public Buildings, Open Spaces and Waterways. Chairman, Frank Miles Day, F. A. I. A., Philadelphia. Papers: The Proper Distribution of Public Buildings, Mr. Ernest Flagg, F. A. I. A., New York City; The Location of Public Buildings in Parks and Other Public Open Spaces, Frank Miles Day, F. A. I. A., Philadelphia.

Tuesday, May 16—Third conference session from 10 to 12 a. m., under the direction of the Committee on Buildings in Relation to Street and Site. Chairman, Lawrence Veiller, Secretary and Director, National Housing Association, New York City. Paper, Buildings in Relation to Street and Site, Lawrence Veiller. Fourth conference session from 2:30 to 4 p. m., under the direction of the Committee on Taxation. Chairman, Hon. Lawson Purdy, LL.D., President Department of Taxes and Assessments, New York City. Paper, Taxes, Assessments and Condemnation, on Lawson Purdy, LL.D. Discussion: Prof. Frank J. Goodnow, Columbia University; Hon. James Alcorn, City Solicitor, Philadelphia; Prof. F. Spencer Baldwin, Boston University; Prof. Charles E. Merriam, University of Chicago. The University of Pennsylvania will give a tea to the members of the conference from 4 to 6 o'clock. Fifth conference session from 10 to 12 p. m., under the direction of the Committee on Traction Lines, Railroads and Docks. Chairman, George E. Hooker, Secretary, Chicago City Club. General topic, The Dock Problem. Papers: Hon. Alvin Tompkins, Dock Commissioner, New York City; Hon. Joseph Hasskarl, Director Department of Docks and Ferries, Philadelphia; Hon. T. E. Gibbon, President of Dock Commission, Los Angeles. Cal.; George C. Sykes, formerly Secretary Chicago Harbor Commission.

Wednesday, May 17—Sixth conference session from 10 to 12 a. m., under the direction of the Committee on Street Planning. Chairman, Nelson P. Lewis, Chief Engineer, Board of Estimate and Apportionment, New York City. General topic, Street Widths and Their Subdivision. Papers: Charles Mulford Robinson, Civic Adviser, Rochester, N. Y.; John Nolen, Fellow American Society Landscape Architects, Cambridge, Mass.. Discussion: Chief Street Surface, George W. Tillson, Chief Engineer, Bureau of Highways, Borough of Manhattan, New York; The Subsurface, George S. Webster, Chief Engineer, Philadelphia. Seventh conference session from 3:30 to 5 p. m., under the direction of the Committee on Legal and Administrative Methods. Chairman, Andrew Wright Crawford, Esq., Assistant City Solicitor, Philadelphia. Paper: The Principles of a Uniform City Planning Code, A. W. Crawford. At 8 o'clock the City Club of Philadelphia will give a subscription dinner, at which the members of the conference will be guests.

National Civic Federation.—At a meeting of the Public Welfare Committee, New York, April 7, to discuss the Triangle Waist Company Fire, Fire Chief Croker was invited to speak. After describing the hazardous conditions existing in the building, he concluded in part as follows: "I should recommend outside fire escapes on all buildings, fireproof or not. I would have standpipes with outlets at every floor and buckets for water and fire drills on weekly fire drills. In addition, there ought to be, whenever possible, outside fire escapes—tower escapes, enclosed in iron. They are the only means for getting out of a fire. The trouble is, as the law stands, re-

sponsibility is all divided up between three or four departments and bureaus—the factory inspectors, the Labor Bureau, the tenement house inspectors, the Building Department and I don't know what all. Responsibility ought to be invested in one department, say the Fire Department, and that department ought to have the legal authority to make good. I think it would make good.

This department ought to have authority to inspect factories, and if it found them unsafe to serve a written notice on the occupants (not the owners of the building). After a reasonable time, if the notice remained unheeded, the factory should be closed and a notice left on the door to the effect that it had been closed because the people refused to make the place safe to work in. And it ought to be kept closed.

National Highway.—The National Highways Club, New York and Washington, has been organized to promote the construction of a highway of special design between New York and Washington. The designing engineer is H. Douglass Layman, president of the National Road and Realty Company, 115 Broadway, New York, and Washington Loan and Trust Building, Washington, D. C. The extreme width of the road, according to the plan, will be 144 feet and will include six separate roadbeds and two sidewalks. Trolley cars, automobiles and horse-drawn vehicles will be given a roadway for each direction traveled. The cost of the highway is figured at \$90,000 a mile. The scheme is expected to be self-sustaining, the cost of building and maintaining the road being paid from the increase in real estate values participated in by the company along the route and from the tolls charged for the use of the auto roads, the fares charged on the trolley system and rights granted for privileges of running wires, pipes, etc.

Good Roads Association of Florida.—President J. G. Dampier and Secretary C. L. Bittinger have issued an announcement of the annual meeting, to be held at Tallahassee April 27 and 28. They state that the proceedings of the convention will include addresses and discussions upon the scientific, ethic and economic phases of the subject and its relation to industrial progress and development. Legislation pertaining to State co-operation and supervision, financial ways and means, the use of convicts and other details of the subject will receive practical consideration. State and county officials, Mayors of cities, officers of commercial, agricultural, industrial, transportation, development, civic improvement and all good roads advocates are earnestly requested to be present.

Municipal Art Society of New York.—Mayor Gaynor, who is an honorary director, has sent a letter to the heads of all city departments asking them to co-operate with the society in the coming exhibition, which will be held at the National Arts Club, 119 East Nineteenth street, from April 10 to April 23. They have been asked to send in maps, photographs and such other data as will show what is being done to improve the appearance of the city.

International Association of Fire Engineers.—At a meeting of the directors of the association, Milwaukee, March 29, arrangements were made for holding the annual convention at Racine, Wis., September 19-22. A large exhibit hall has been arranged for. Suitable hotel accommodations can be secured in Milwaukee, which is 24 miles away, as well as at Racine. The sessions of the convention will be held in the Racine City Hall. Eleven topics for discussion were selected and invitations sent out to members who are invited to speak.

Calendar of Meetings

- April 10-23.** Municipal Art Society of New York.—Exhibition, National Arts Club, 119 East Nineteenth street, New York City.
- April 27-28.** Good Roads Association of Florida.—Annual Meeting, Tallahassee. C. L. Bittinger, Secretary, Ocala, Fla.
- May 11.** Massachusetts Highway Association.—Quarterly Meeting in conjunction with the New England Conference on Street Cleaning, Springfield, Mass.
- May 15-17.** National Conference on City Planning.—Philadelphia, Pa.—Flavel Shurtleff, Secretary, 19 Congress street, Boston, Mass.
- May 18-19.** Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25.** National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26.** National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 25-26.** League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2.** National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14.** National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-10.** American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.** National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.** National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June.** New England Conference on Street Cleaning.—Springfield, Mass.—Corresponding Officer, Carol Aronovici, 55 Eddy street, Providence, R. I.
- June 11-16.** International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.** New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.** American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.** National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- August 15-18.** Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 19-22.** International Association of Fire Engineers.—Annual Convention, Racine, Wis.
- September 19-22.** American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.** International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.** American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.

PERSONALS

ARCALL, JOHN C., former secretary of the Board of Public Works under Mayor Pratt, was unanimously elected to the position of purchasing agent by the City Commissioners of Spokane, Wash., to succeed John Gifford.

BOUSLOG, JAMES, has been appointed Chief of Police of New Castle, Ind., succeeding Chief Burr, resigned.

CARR, HENRY F., of Lawrence, Mass., has been appointed a member of the Park Commission for a term of five years to succeed Colonel Percy Parker.

LYOYD, CHARLES B., has been appointed by the Governor of Maryland a member of the State Roads Commission.

MCCLEUNG, BENJAMIN, Mayor of Newburgh, N. Y., has been appointed counsel to the Forest, Fish and Game Department, to succeed Ellis J. Stanley, who was recently appointed County Attorney for Albany County.

POOLE, C. ARTHUR, has been appointed Assistant City Engineer of Rochester, N. Y., to have charge of the construction of the new \$1,000,000 sewage disposal plant to be built by that city.

REYNOLDS, S. V., mayoralty candidate on the Citizens' Non-Partisan Ticket, was elected by an overwhelming majority.

STEELE, DR. R. L., has been elected president of the Board of Health of McKeesport, Pa.

TARVER, T. C., Jr., City Engineer of Houston, Texas, has resigned to go with the Houston Land Corporation as consulting engineer.

THOMPSON, THOMAS C., has been elected Mayor of Columbia, S. C.

WILSON, J. STITT, has been elected Mayor of Berkeley, Cal. Mr. Wilson, who was formerly a minister, is a Socialist, and was Socialist candidate for Governor last November. This is the first time in the history of California a Socialist has been elected Mayor of a city.

MAYORALTY ELECTIONS

MICHIGAN.

Adrian—F. M. Joslin.
 Bay City—R. O. Woodruff.
 St. Clair—Frank Moore, Jr.
 Lapeer—Dr. F. A. Tinker.
 Flint—John A. C. Menton.
 Ann Arbor—William Waltz, re-elected.
 Pontiac—Robert J. Lounsbury.
 Port Huron—Frank Moore.
 Owosso—Otto L. Sprague.
 Corunna—A. E. Richards.
 Sturgis—Homer L. Allard.
 Marine City—R. B. Baird.
 South Haven—Charles Funk.
 Monroe—H. C. Ovis.
 Cheboygan—Frank Brackett.
 Gladwin—Frank Leonard.
 Big Rapids—Harry I. Dreshon.
 Bessemer—Dr. Pinkerton.
 Charlotte—E. G. David.
 Boyne City—W. W. Bailey.
 Petoskey—W. L. McManus.
 Ludington—Joseph Zeiff.
 Coldwater—Charles A. Conover.
 Battle Creek—Dr. Thomas Zelinsky.
 Allegan—Clarence W. Young.
 Tawas City—Callie Johnson.
 Hillsdale—A. L. Lincoln.

OKLAHOMA.

Guthrie—Frank Olsmith.
 Shawnee—A. D. Martin.
 Lawton—George H. Block.

ARKANSAS.

Little Rock—Charles E. Taylor.
 Pine Bluff—Dr. A. C. Jordan.
 Texarkana—John P. Kline.
 Hot Springs—W. W. Walters.

TRADE NOTES

Cast Iron Pipe.—Chicago: With the business already closed and numerous inquiries on their books, the leading pipe people seem justified in their opinion that this year's business will total above normal. Prices are firm. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: No reports are made of any lettings of consequence. Production is still less than for the same period last year. Quotations: 4 to 6-inch, \$23; 8 to 12-inch, \$22; over 12-inch, average \$21. San Francisco: The demand continues active in all the Coast States. New York: Competition continues keen for all orders coming up. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—The market continues strong. Quotations: New York, 4.55c; St. Louis, 4.30c.

Large Motor Centrifugal Pumps.—The borough of South River, N. J., has placed an order for pumps for its new water works with the Buffalo Steam Pump Company, Buffalo, N. Y. This equipment consists of two 5-inch two-stage centrifugal pumps, each having a capacity of 800,000 gallons of water per day against a total head of 135 pounds. The pumps will be driven by 75-horsepower, 1,700-revolutions-per-minute, Fort Wayne motors.

Sewer Cleaning.—The Sieben System of Sanitation Company has recently received the following record of cost of cleaning sewers. N. M. Clancy, Superintendent of Sewer Cleaning and Repairs, says:

On Ashland avenue sewer we operated the machine, cleaning a distance of 380 feet after the machine was set in the sewer in twenty-four (24) minutes. This sewer was about one-third full, a 15-inch pipe sewer. The test given the machine on Second street, in an 18-inch pipe sewer, was full within 6 inches of the top. We cleaned 280 feet in forty-four (44) minutes. On Second street, in a 15-inch pipe sewer, we cleaned 300 feet in thirty-six (36) minutes. This sewer was very badly congested, only about 4 inches of an opening in the top of the sewer.

J. E. Porter, Mayor of Kansas City, Kan., says:

I wish to compliment you upon the efficiency of your sewer cleaning system, which I saw in operation upon a 10-inch sewer in the alley south of Minnesota avenue, between Ninth and Tenth streets. This sewer has given our Sewer Department much trouble, costing us hundreds of dollars a year keeping it in good condition. After getting your rods through the sewer, which I understand took about seven hours' work, this including time spent in taking out about 200 feet of our cleaning rods which were stuck in the sewer, it took just 47 minutes to run your cleaning apparatus the full 400 feet length of the sewer at a total cost of \$9. This cost included time for three laborers and one man with a wagon, making the cost about .02½ cents per lineal foot.

Road Machinery.—Six years ago the J. I. Case Threshing Machine Company put on the market its power-steered, 10-ton steam road roller, which was then the only power-steered roller on the market. This year the company decided to put forth a complete line for road building. In addition to the road roller and road sprinkling wagons the company has been selling, it has added recently the perfection graders and drags, rock crushers, rotary stone screens, rooters, road scrapers, railroad and township plows, the Troy line of bottom dump wagons, boxes, reversible bottom dump wagons, Case municipal tractors, especially constructed for use on any kind of paved streets, and Case contractors' hauling engines.

Tarvia.—The Barrett Manufacturing Company has issued a 1911 edition of its book on Tarvia. As formerly the three grades of Tarvia are: X, for use hot as a binding material; A, the next heaviest grade, also used hot, and B, which is light enough to be used cold. A modification of the methods of construction hitherto generally used is called Tarvia Modern Pavement, which is described as follows: The foundation is prepared as for ordinary macadam, but care should be taken to see that this foundation is properly drained and properly consolidated, for the best of surfaces can be destroyed by softness and movement below. Upon the foundation the base course is laid, using stone 3 inches to 1 inch in size. Usually a thickness of 4 inches, measured after rolling, will be sufficient. This course is filled, rolled as for ordinary macadam and then has spread upon it ½ inch of clean, sharp sand or good gravel. Over this, without further rolling, is sprayed "Tarvia-A" to the amount of one gallon to a square yard. Another layer of stone (3 inches to 1 inch) is then spread to such a depth that when rolled this course will be 2½ inches thick. It is then rolled thoroughly with a steam roller, until the Tarvia and sand are drawn up between the stone and until this layer of stone is bedded firmly into the stone below. The layer of Tarvia and sand holds this course firmly in place and cements the top course of the road thoroughly to the bottom course. A spraying of "Tarvia-X" is then given the road, using 1¼ gallons to a square yard, and a thin layer of ¾-inch stone is spread over the surface. Enough stone must be used to fill in all the chinks of the surface, making it smooth but not enough should be used to leave any loose material on the top. The road is rolled again until perfectly smooth and a final coat of "Tarvia-A," amounting to one-half gallon to the square yard, is sprayed on and the road finished by adding pea stone or screenings and given a final rolling. The booklet is gotten up in the usual good style displayed by the Barrett company, and is handsomely illustrated.

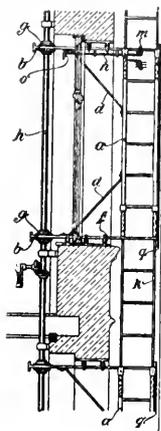

Corcoran Coupling.—The Allyn Brass Foundry Company, Detroit, Mich., has issued a folder explaining the Corcoran joints for lead pipe, made without wiping. The folder states that an exceptionally good man and helper can wipe six joints in ten hours and that an inexperienced man can make six joints with the Corcoran coupling in one hour and the joints will be better. The company manufactures corporation cocks and inverted curb cocks.

Prevailing Rate of Wages.—An important decision regarding the subletting of a contract outside of a State where a different rate of wages prevail has been made by Justice Crane of the New York Supreme Court. The Thompson-Starrett Company had a contract for building the new municipal building in Manhattan. The company sublet the granite work to the Mount Waldo Granite Works, of Maine, which had the granite cut and trimmed by workmen at a daily wage of \$3. For the same work \$4.50 is paid in New York State. Justice Crane declared that there was nothing in the contract or in the labor law requiring the contractors to pay workmen of another State the wages prevailing in this State.

PATENT CLAIMS

987,494. APPARATUS FOR LIFE-SAVING IN CASE OF FIRE. Franz Scherrer, Berlin, Germany. Serial No. 559,810.

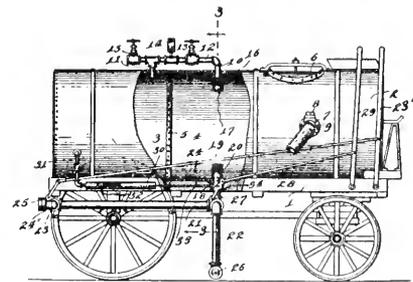

In combination in a device for life-saving from fire, a series of vertical ladders retractable within the window embrasures and normally concealed therein, side plates fixed to said embrasures and adapted to conceal one side of said ladders, covering plates fixed to the outer rail of said ladders

and adapted to close the space between each side plate and the corresponding window jamb, a pair of horizontal bars attached to the top and bottom respectively of each ladder section, means for supporting said bars and ladder sections, a vertical rotatable shaft entirely located within the building, and mechanism whereby the rotation of the shaft projects the entire set of ladders beyond the window embrasures and at a right angle thereto.

987,545. STREET-FLUSHING MACHINE. Jacob I. Brorby, Shenandoah, Iowa. Serial No. 576,453.

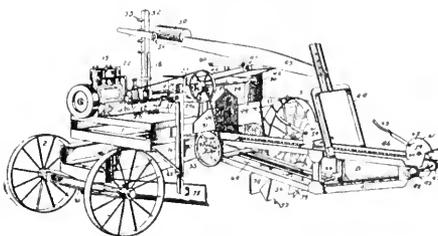

A sprinkling device comprising a tank, a partition dividing the tank into water and air compartments, means connecting the water and air compartments having a

valve therein to control the supply from one to the other, a valved discharge pipe connected with the water compartment, and means communicating with the air compartment and connected to the valve in the discharge pipe for controlling the flow through the discharge nozzle.

987,937. DITCHING APPARATUS. Joseph E. Wyckoff, Los Angeles, Cal. Serial No. 563,219.

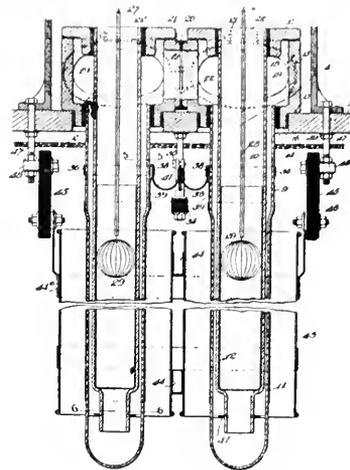

In ditching apparatus, in combination, a frame, mechanism hingedly connected at one end thereof with the frame, said mechanism including a frame and earth removing members mounted thereon, counterbal-

ancing means connected with said mechanism for raising and lowering the same, means coacting with the first means to hold the mechanism in adjusted position and permitting yielding thereof when the members meet with obstructions, and operative connections for the mechanism.

987,902. APPARATUS FOR PRODUCING OZONE. Clifford D. Meeker, East Orange, N. J., assignor to Gerard Ozone Process Company, New York, N. Y., a Corporation of New Jersey. Serial No. 575,393.

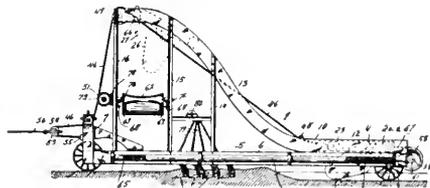

An ozone apparatus which comprises a tank, a cover therefor, ozonizing elements supported by the cover, a casing inclosing

the upper ends of the elements, a fluid passage communicating with the interior of the casing, a separate conduit box for each element, said boxes being connected in series, and a fluid passage from the boxes through a wall of the casing.

987,660. EXCAVATING-MACHINE. Leonard C. Wood, Denver, Colo. Serial No. 555,817.

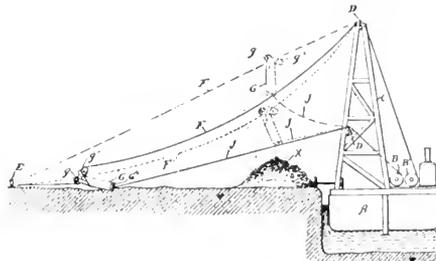

The combination with a vehicle, of a bucket normally locked against movement in relation to the vehicle when at its rear-

ward limit of movement, means connected with the bucket and vehicle for imparting forward travel to the latter, and means for releasing the bucket to allow it to travel independently of the vehicle.

987,612. EXCAVATOR-SHOVEL. Henry G. Butler, Kenosha, Wis. Serial No. 534,068.

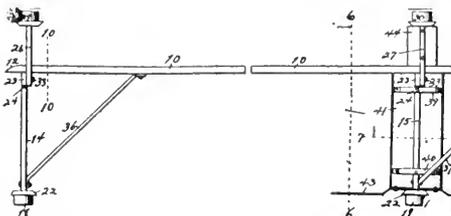

In an excavator shovel of the type described a body portion with a bottom hinged

thereto and means in connection with a drag line for controlling said bottom, substantially as set forth and shown.

987,879. COMBINED CURB AND GUTTER FINISHER. Alfred Horrabin, Iowa City, Ia. Serial No. 575,580.

A combined curb and gutter finisher, comprising a longitudinal face plate, trow-

els on opposite sides of and rigidly connected to and arranged transversely of said face plate, and supporting and guiding wheels at opposite ends of said trowels.

Smoke Prevention Compound.—Smoke Inspector Nelson and Superintendent Jerome are conducting tests of a patent smoke prevention compound invented by William H. Murray, Norwalk, O.

Pyrene.—Six pieces of the Paterson (N. J.) fire apparatus have been equipped with Pyrene fire extinguishers, which have been given to the Fire Department by the Pyrene Manufacturing Company, 410 East Thirty-second street, New York, N. Y. One extinguisher will be placed on each chief's wagon and each of the three trucks. Fire Chief Stagg will have the extinguishers used on gasoline fires and fires from electric wiring.

Lighting Company Consolidation.—The Board of Public Utilities, Trenton, N. J., has decided to approve the proposed merger of the Shore Electric Company, the Seabright Electric Company and the Citizens' Light and Fuel Company of South Amboy into the Shore Lighting Company. The new company will be authorized by the board to issue \$400,000 of 5 per cent mortgage bonds.

Incinerator Incinerated.—The Somerville, Mass., incineration plant was practically destroyed by fire last week, causing a loss of about \$3,000. The blaze is supposed to have started by paper that littered the floor becoming ignited from the furnace.

Testing for Water Waste.—The Pitometer Company, 220 Broadway, New York, has resumed its series of tests for water waste at Yonkers, N. Y. Superintendent of Water Peene issued orders last week for the digging of holes, in which the company is to install the instruments used to measure and record the flow in the mains.

Garbage Plant.—C. C. Fisher, York, Pa., who has the contract for disposing of garbage at Bridgeport, Conn., has nearly completed the rebuilding of the works formerly belonging to the Bridgeport By-Products Company. The last pieces of machinery installed were a press and a dryer.

Sulphate Alumina.—Mechanical filtration plants to the number of 66 located throughout Pennsylvania and representing an investment of about \$20,000,000 will be forced out of existence if a bill introduced in the Legislature by E. H. Fahey, Philadelphia, should pass. The bill aims to prohibit the use of alum and alum compounds in the filtration of water furnished to the public for drinking purposes. There are three manufacturing companies in Pennsylvania manufacturing the material; they are the Pennsylvania Salt Manufacturing Company, Charles Leunig & Co. and Harrison Brothers & Co.

Gas Engines.—The Bruce-Macbeth Engine Company, Cleveland, O., has published a new catalogue describing and illustrating its gas engines. At the front of the booklet a tabular statement of comparative costs of fuel for different kinds of power is given. A simple non-condensing engine is estimated to require 8 pounds of coal per horsepower, a compound condensing steam engine 3 pounds and a gas engine using producer gas about 1 1/4 pounds. An illustration of a 300-horsepower, four-cylinder gas engine installed at the city lighting plant, Canal Dover, O., serves to point out the fact that gas engines are a municipal proposition.

THE MUNICIPAL INDEX

In Which Are Listed and Classified by Subjects All Articles Treating of Municipal Topics Which Have Appeared During the Past Month in the Leading Periodicals

It is our purpose to give in the second issue of each month a list of all articles of any length or importance which have appeared in all the American periodicals and the leading English, French and German ones, dealing more or less directly with municipal matters. The index is kept up to date, and the month of literature covered each time will be brought up to within two or three days of publication. Our chief object in this is to keep our readers in touch with all the current literature on municipal matters. In furtherance of this we will furnish any of the articles listed in the index for the price named after each article, except that where an article is continued in two or three issues of the paper, the price given is for each of said issues. In addition to the titles, where these are not sufficiently descriptive or where the article is of sufficient importance, a brief statement of its contents is added. The length also is given, and the name of the author when it is a contributed article.

ROADS AND PAVEMENTS

Highways in Indiana. Address before National Good Roads Congress. By W. P. Blair. 1 p., Clay-Worker, March. 25 cts.

Roads and Pavements. Digest of remarks by Frank J. Spruce, Pres. New Jersey State Association of County Engineers, before Convention. 3 pp., The Public Officials Magazine, February. 10 cts.

The Highway, the Farmer and the Automobile. Illustrated. 2 pp., The Canadian Engineer, Mar. 2. 10 cts.

The Inter-Relation of Good Roads and Good Schools. Address before Southern Educational Association. By Chas. H. Hoyt. Illustrated. 2 1-2 pp., Good Roads, March. 10 cts.

The Economics of Modern Highway Engineering. Paper before American Society of Municipal Improvements. By Arthur H. Blanchard. 2 pp., Good Roads, March. 10 cts.

Road Construction, Some Ideas in Modern. By John McNeal. 1 p., Southern Good Roads, March. 10 cts.

The Art of Roadmaking. By Harwood Frost. 2 1-2 pp., The Surveyor and Municipal and County Engineer, Mar. 17. 25 cts.

The Effective Cheap Drag. Illustrated. 1 p., The Canadian Engineer, Mar. 2. 10 cts.

Systems of Road Building. By W. A. McLean. Paper before Good Roads Association of Ontario. 3 pp., Canadian Municipal Journal, April. 15 cts.

Method and Cost of Constructing a Macadam Road in Fine Grained Loose Soil Subject to Erratic Drainage Conditions. Illustrated. 3 pp., Engineering-Contracting, Feb. 15. 10 cts.

Meadow Roads as Constructed in Southern New Jersey Counties. Paper before New Jersey State Association of County Engineers. By E. D. Rightmire. 1 1-2 pp., Good Roads, March. 10 cts.

Construction and Care of Earth Roads. By G. W. Cooley, State Engineer of Minnesota. Illustrated. 3 pp., Good Roads, March. 10 cts.

Gravel and Earth Object Lesson Roads Constructed by the United States Government. 1 1-2 pp., Good Roads, March. 10 cts.

Gravel Road Building in Michigan. By Frank F. Rogers. Illustrated. 3 1-3 pp., Engineering-Contracting, Mar. 15. 10 cts.

Roads for Heavy Traffic. Illustrated. 3 pp., The Municipal World, March. 10 cts.

Niagara River Boulevard. Paper before Ontario Good Roads Association. By J. H. Jackson. 1 1-2 pp., Contract Record, Mar. 29. 15 cts. 2 pp., The Canadian Engineer, March 9. 10 cts.

Bituminous Road Binders. 1 p., The Canadian Engineer, Mar. 2. 10 cts.

Ten Years' Experience of Tar-Grouted Granite Macadam in a Lancashire Urban District. By Geo. H. Ashworth and Vincent W. Laithwaite. 2 pp., The Surveyor and Municipal and County Engineer, Mar. 3. 20 cts.

Bituminous Materials in Road Construction and Maintenance. Paper before American Association for the Advancement of Science. By A. H. Blanchard. 4 pp., Municipal Engineering, April. 25 cts. 1 1-2 pp., Engineering-Contracting, Mar. 29. 10 cts. 1 1-3 pp., Engineering Record, Mar. 18. 10 cts.

The "Rocmac" Method of Road Construction. Illustrated. 1 1-2 pp., The Canadian Engineer, Mar. 2. 10 cts.

Method and Cost of Constructing Tar Grouted Macadam. 1 p., Engineering-Contracting, Mar. 29. 10 cts.

Arguments for Bituminous-Bound Macadam Built by the Penetration Method. By T. Warren Allen, Engineer Member N. Y. State Highway Commission. 2-3 pp., Engineering Record, Mar. 4. 10 cts.

Asphalt Macadam Roadways. By Thomas M. Roche. 1 1-2 pp., Good Roads, March. 10 cts.

Oil Macadam in California. 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Methods of Constructing and Experience

of California Cities with Oil Macadam. 1 1-3 pp., Engineering-Contracting, Mar. 8. 10 cts.

Bitumens and Their Essential Constituents for Road Construction and Maintenance. By Prevost Hubbard. 4 1-2 pp., Good Roads, March. 10 cts.

Terms Used in Bituminous Road Work. Definitions Adopted by the U. S. Office of Public Roads. 4 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Dust Layers, The Use of Artificial. Illustrated. 6 pp., Good Roads, March. 10 cts.

Maintenance of Earth and Gravel Roads in New York State by Road Honing. Illustrated. 1 p., Engineering-Contracting, Mar. 15. 10 cts.

The Development of a Road Maintenance System for Menominee County, Michigan. By K. I. Sawyer, County Road Engineer. 1 p., Engineering-Contracting, Mar. 8. 10 cts.

Macadam Roads and Their Preservation. By L. W. Page. Illustrated. 3 pp., Southern Good Roads, March. 10 cts.

Traffic Records for Purposes of Comparison, Simplification of. By Maj. W. W. Crosby. 3 2-3 pp., Municipal Engineering, March. 50 cts.

Relation Between Modern Traffic and the Alignment and Profile of Highway Design. Paper before American Association for the Advancement of Science. By H. B. Drowne. 1 1-2 pp., Canadian Engineer, Mar. 30. 15 cts. 1 1-4 pp., Good Roads, March. 10 cts.

Street Traffic Data. Tabular Statement. 3 pp., Municipal Journal and Engineer, Mar. 22. 10 cts.

Laws of Ohio, Present Highway, and the Proposed New Law. Paper before American Road Builders' Association. By James C. Wonders. 2 pp., Good Roads, March. 10 cts.

Men in Highway Work, Trained. By A. N. Johnson, State Highway Engineer, Illinois. 5 pp., The Public Officials Magazine, February. 10 cts. 2 pp., The Canadian Engineer, Mar. 2. 10 cts.

Paving in 1910 and '11. Data collected in March from 460 cities. 15 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Modern Pavement Construction. Illustrated. 2 1-2 pp., The Canadian Engineer, Mar. 2. 10 cts.

Toronto Street Paving. 1-3 pp., Municipal Journal and Engineer, April 5. 10 cts.

Committees on Pavement Specifications. 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

London Paving Materials. Metropolitan Committee's Annual Report. 4 pp., Surveyor, Mar. 24. 25 cts.

Pavements in Grass Forks. Untreated and Treated Wood Blocks. Blome and Bitulithic Pavements. By H. G. Lykken, City Engineer. 1 p., Municipal Journal and Engineer, Mar. 15. 25 cts.

Best Pavements in Demand. 1-4 p., Municipal Journal and Engineer, Mar. 15. 25 cts.

Methods of Road and Sidewalk Building. By F. L. Fellows. 1 1-2 pp., Contract Record, Mar. 29. 15 cts.

Cost of Pavements. 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Crown, Street Paving. By J. T. Powell. Illustrated. 3 pp., Proceedings of American Society of Civil Engineers, March. \$1.00.

Brick Pavements, Cracking of Cement Grouted, Causes and Remedies. Paper before the Michigan Engineering Society. By Earle R. Whitmore. 1 1-2 pp., Engineering-Contracting, Feb. 15. 10 cts.

New Standard Brick Rattler. Recommended by National Paving Brick Manufacturers' Association. Instructions for construction and use. 1 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Concrete Street Paving in Mason City, Ia. Paper before Iowa Engineering Society. By F. P. Wilson. Illustrated. 1 1-2 pp., Cement Era, April. 40 cts.

Cement Concrete Paving. Paper before Middle West Cement Exhibition. By C. P. Chase. 7 pp., Midland Municipalities, April. 10 cts.

Cement Concrete Street Paving in

Mason City, Iowa. By F. P. Wilson, City Engineer. 2 2-3 pp., Municipal Engineering, March. 50 cts.

Asphalt Pavements, New York's. By D. T. Pierce. 2-3 pp., Municipal Journal and Engineer, Mar. 29. 10 cts.

New York Pavements. 1-2 p., Municipal Journal and Engineer, Mar. 29. 10 cts.

Methods and Costs of Constructing an Asphalt Street with Concrete Walks, Curb and Lamp Posts. Illustrated. 1 1-2 pp., Engineering-Contracting, Mar. 15. 10 cts.

The Municipal Asphalt Paving Plant at Detroit, Mich. By Len G. Shaw. 3 1-3 pp., Municipal Engineering, March. 50 cts.

Wood Block Pavements of Atlanta. Earlier pavements and recent construction. Figures showing extent and cost of pavement and conclusion. By J. N. Hazelhurst. Illustrated. 2 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Wood Block Paving in Aberdeen, Tamarack with sixteen-pound creosote treatment. Details of construction. By R. B. Easton, City Engineer. 1 1-2 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Wood Block Paving in Pensacola. Streets with flat grades on low ground; cement mortar cushion; expansion joints between cracks. By Geo. Rommel. Illustrated. 1 p., Municipal Journal and Engineer, Mar. 15. 25 cts.

Wood Paving in American Cities. One hundred cities have laid it; Construction in large cities. Illustrated. 3 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Development of Wood Block Specifications. History of the use of treated wood blocks in the East; character of preservative oil, antiseptic and waterproofing qualities. By Geo. W. Tillson, Chief Engineer of Highways, Manhattan. Illustrated. 3 pp., Municipal Journal and Engineer, Mar. 15. 25 cts.

Granite Block Specifications. 1 p., Municipal Journal and Engineer, Mar. 15. 25 cts.

Wood Jointed Granite Blocks. 1-4 p., Municipal Journal and Engineer, Mar. 15. 25 cts.

Planning, Control of Street. 1-4 p., Municipal Journal and Engineer, April 5. 10 cts.

Dedication of Platted Streets. Rights acquired by purchasers of lots in streets delineated on maps. By John Simpson. 1 p., Municipal Journal and Engineer, April 5. 10 cts.

Street Names on Curbs. Illustrated. 1-3 p., Municipal Journal and Engineer, April 5. 10 cts.

Denver Street Signs. Illustrated. 1 p., Municipal Journal and Engineer, Mar. 22. 10 cts.

SEWERAGE AND SANITATION

Sewer at Syracuse, The Main Intercepting. Illustrated. 2 1-3 pp., Engineering Record, Mar. 4. 10 cts.

The Main Drainage Works at Toronto. Illustrated. 4 pp., Engineering Record, Mar. 18. 10 cts.

Concrete Outlet Sewer at Fort Smith, Ark. By Matt and Bemis, contractors. Illustrated. 1 1-2 pp., Municipal Engineering, April. 25 cts.

Pipe, Vitrified Sewer and Culvert. Portion of official report of the 25th annual convention of National Brick Manufacturers' Association. By George H. Tefft. Illustrated. 6 3-4 pp., The Clay Worker, February. 25 cts.

Yearly Variation in Cost of Pipe Sewers. By E. S. Rankin. Illustrated. 1-2 p., Municipal Journal and Engineer, Mar. 29. 10 cts.

Cost of Constructing Reinforced Concrete Pipe Sewers at Mishawaka, Ind. Paper before the Indiana Engineering Society. By Wm. P. Moore, City Engineer. 1 1-2 pp., Engineering-Contracting, Feb. 15. 10 cts.

Manholes in Winnipeg. 1-4 p., Municipal Journal and Engineer, Mar. 29. 10 cts.

Tests of Drain Tile and Sewer Pipe, Standard. Paper before Iowa Engineering Society. By A. Marston. Illustrated. 2 pp., Engineering-Contracting, Mar. 15. 10 cts.

Proposed Standard Method of Testing Drain Tile. Paper before Interstate Tile Manufacturers' Association. By C. M. Powell. Illustrated, 3 pp., Canadian Engineer, Mar. 30, 15 cts.

Concrete, The Action of Sewage on. 3 pp., Cement Age, March, 15 cts.

Disintegration of Concrete in Sewage Disposal Plant. 1 p., Canadian Engineer, Mar. 30, 15 cts.

Stream Pollution, Legislation on. Paper before Illinois Sanitary and Water Supply Association. By H. M. Ely, 1½ pp., Municipal Engineering, April, 25 cts.

Observation upon the Law Relating to the Pollution of Rivers by Sewage. By A. C. Farquharson. 9 pp., Journal, Royal Institute of Public Health, March, 60 cts.

A Plea for a Clean River. By Albert W. Cobb. Illustrated, 4 1-3 pp., Western New England, February, 15 cts.

Sewage Disposal in California. 1-4 p., Municipal Journal and Engineer, Mar. 29, 10 cts.

Sewage Disposal Works at Bordentown. Screen chambers, Emscher tanks, contact beds, settling basins, sand filters and sludge pit. By E. J. Kastenhuber, Jr. Illustrated, 3½ pp., Municipal Journal and Engineer, Mar. 29, 10 cts.

Chatham-Madison Joint Sewage Disposal Works. Construction of Emscher sedimentation tanks, double contact beds, sand filter and sludge bed. Cost of construction and operation. Illustrated, 4½ pp., Municipal Journal and Engineer, Mar. 8, 10 cts.

Modern Sewage Disposal. By F. W. Kerns. 2-2-3 pp., Municipal Engineering, March, 50 cts.

Sewage Disposal in England. By H. N. Ogden. 4 pp., The Cornell Civil Engineer, March, 20 cts.

Market Harborough Sewage Disposal Works. By H. W. Coales. Illustrated, 6 pp., Surveying and the Civil Engineer, Mar. 3, 15 cts.

German System of Sewage Purification. 1-3 pp., Municipal Journal and Engineer, Mar. 22, 10 cts.

Natural Purification of Sewage in Practice at Hyde. Abstract of paper before Association of Managers of Sewage Disposal Works. By Thomas Horrocks. Illustrated, 2 pp., The Contract Journal, Mar. 1, 20 cts.

Aerobic Methods of Sewage Disposal. 1½ pp., Contract Journal, Mar. 22, 20 cts.

Grit Chamber Sand, Washing. 1-3 p., Municipal Journal and Engineer, April 5, 10 cts.

Sedimentation Tank Experiments. 1-4 p., Municipal Journal and Engineer, April 5, 10 cts.

Sewage Precipitation Patents. 1-4 p., Municipal Journal and Engineer, Mar. 8, 10 cts.

The Imhoff Patents. Communication from W. S. Shields. Illustrated, 1 p., Municipal Journal and Engineer, Mar. 8, 10 cts.

Analysis. A Method for Determining the Parts per Million of Dissolved Oxygen Consumed by Sewage and Sewage Effluents; Columbus Sewage Works. By C. B. Hoover, Chemist-in-charge. 1 p., Engineering News, Mar. 16, 15 cts.

Public Health Movement on the Pacific Coast. By Sarah Shuey, M.D., 8 p., Annals, American Academy Political and Social Science, March, \$1.

Health Problems of the Indians. By Jos. A. Murphy, M.D., Medical Supervisor, U. S. Indian Service, 7 pp., Annals, American Academy Political and Social Science, March, \$1.

Sources of Information upon the Public Health Movement. By Robert Emmet Chaddock. 16 pp., Annals, American Academy Political and Social Science, March, \$1.

New York Health Bulletin. 1-4 p., Municipal Journal and Engineer, Mar. 22, 10 cts.

The Census and the Public Health Movement. By Cressy L. Wilbur, Chief Statistician Bureau of Census, Washington. 19 pp., Annals, American Academy Political and Social Science, March, \$1.

Health Needs and Civic Action. By William H. Allen, Director Bureau Municipal Research, New York, 10 pp., Annals, American Academy Political and Social Science, March, \$1.

Municipal Authorities and Public Health. Paper before Union of Nova Scotia Municipalities. By A. P. Reid, Provincial health officer. 2 pp., Canadian Municipal Journal, April, 15 cts.

Scientific Research by the Public Health Service. By J. W. Kerr, M.D., 16 pp., Annals, American Academy Political and Social Science, March, \$1.

Protecting Public Health in Pennsylvania. By Samuel G. Dixon, Commissioner of Health of Pennsylvania, 8 pp., Annals, American Academy Political and Social Science, March, \$1.

The Conservation Commission and Public Health. 1 p., The Canadian Engineer, Mar. 16, 10 cts.

Work of the Committee of One Hundred on National Health. By Wm. Jay Scheffelin, Chairman of the Committee. 19 pp., Annals, American Academy Political and Social Science, March, \$1.

Modern Municipal Sanitation in Cuba. Paper before American Society of Municipal Improvements. By R. Winthrop Pratt. 2½ pp., Municipal Engineering, April, 25 cts.

Ordinances, New Municipal, Relating to Public Hygiene. 3 pp., Public Health Report, Mar. 31, 3 pp., Mar. 24.

School Children, What American Cities are Doing for the Health of. By Leonard P. Ayres, Russell Sage Foundation. 11 pp., Annals, American Academy Political and Social Science, March, \$1.

Ventilation and Public Health. By D. D. Kimball. 12 pp., Annals, American Academy Political and Social Science, March, \$1.

Housing and Health. By Lawrence Veiller, Secretary National Housing Association. 13 pp., Annals, American Academy Political and Social Science, March \$1.

Mosquito Campaign as a Sanitary Measure. By John B. Smith. 12 pp., Annals, American Academy Political and Social Science, March, \$1.

House Fly as a Carrier of Disease. By Edward Hatch, Jr. 12 pp., Annals, American Academy Political and Social Science, March, \$1.

Milk, Clean, and Public Health. By Jesse D. Burks. 15 pp., Annals, American Academy Political and Social Science, March, \$1.

Bakeshops, Unsanitary. By T. P. Kearns. 11 pp., Bulletin, Ohio State Board of Health, February.

Ice. Investigation at Cayuga Lake and Sodus Bay. 2 pp., Monthly Bulletin, New York State Department of Health, February.

Typhoid Bacillus Carrier. By R. M. Grimm. 15 pp., Public Health Reports, Mar. 17.

The Typhoid Epidemic in Ottawa, Canada. By P. H. Brice, M.D. Illustrated. 1 p., Engineering News, Mar. 23, 15 cts.

Fighting American Typhoid. By John Bessner Huber, M.D., 6 pp., The American Review of Reviews, March, 25 cts.

Investigation of Recent Outbreaks of Typhoid Fever in an Adirondack Camp and the Discovery of a Typhoid Carrier. Paper before New York Academy of Medicine. By C. E. North. Illustrated, 5 pp., Medical Record, Mar. 25, 15 cts.

Negroes, Health Problems of the. By John A. Kenny, M.D., Tuskegee Institute. 13 pp., Annals, American Academy Political and Social Science, March, \$1.

Rural Communities, Sanitation in. By Chas. E. North. 23 pp., Annals, American Academy Political and Social Science, March, \$1.

Death Rates, Diminishing. 1-4 p., Municipal Journal and Engineer, Mar. 29, 10 cts.

New York's Health Record. 1-3 p., Municipal Journal and Engineer, Mar. 20, 10 cts.

Disinfection, Report on an Original Form of Sulphur Burner for. By N. Roberts. Illustrated, 8 pp., Public Health Report, Mar. 31.

WATER SUPPLY

Waterworks, Notes on the Design of. By J. N. Nicholson. 2½ pp., Surveying and the Civil Engineer, Mar. 3, 15 cts.

1½ pp., Surveying and the Civil Engineer, Mar. 10, 15 cts.

Investigation of Water Works Service in Wisconsin. 1 p., Engineering Record, Mar. 25, 10 cts.

Water Works at Point Gray, D. C. Illustrated, 1 p., Canadian Municipal Journal, April, 15 cts.

Texas Water Works Details. Gathered from nine cities. Per capita consumption, cost of pumping, recording of data. 2½ pp., Municipal Journal and Engineer, April 5, 10 cts.

Water Supply, Public. By Edmond Bongan. 9 pp., La Technique Sanitaire, March, 50 cts.

Water Supply. Paper before Royal Institution. By J. H. B. Brown. 5 pp., Surveying, Mar. 21, 15 cts.

New Water Supply for Cebu. Illustrated, 5 pp., The Far Eastern Review, January, 25 cts.

Developing a Mexican Water Supply. Illustrated, 4 pp., Contractor, April 1, 20 cts.

Surface Water Supplies for Small Communities. Paper before Royal Sanitary Institute. By Albert P. I. Cotterell. 5 pp., Water and Water Engineering, Mar. 15, 25 cts.

Discussion of Mr. Cotterell's paper. 2 pp., The Surveyor and Municipal and County Engineer, Mar. 3, 20 cts.

Underground Water, Judicial and Parliamentary Decisions with Regard to Rights in, since 1907. Paper before the Surveyors' Institution. By W. Vaux Gra-

ham and Harold F. Bidder. 3 pp., Surveying and the Civil Engineer, Mar. 17, 15 cts.

Pure Water and the Pollution of Waterways. Condensed from address before the Dominion Public Health Conference. By Chas. A. Hodgetts, 1½ pp., The Canadian Municipal Journal, March, 10 cts.

The Obligations of Water Works Superintendents with Respect to the Sanitary Quality of Public Water Supplies. Address before Central States Water Works Association. By Paul Hansen. 3 pp., The American City, March, 15 cts.

Relation of Intakes to Pure Water from the Great Lakes. Paper before Illinois Water Supply Association. By Charles B. Burdick. Illustrated, 12-3 pp., Engineering Record, Mar. 4, 10 cts. 1 p., Engineering News, Mar. 30, 15 cts. Illustrated, 11-3 pp., Fire and Water Engineering, Mar. 15, 10 cts.

Conservation of our National Water Resources. 1½ pp., Water and Water Engineering, Mar. 15, 25 cts.

New Jersey Municipal Waters for Sale. Illustrated, 1 p., Fire and Water Engineering, Mar. 15, 10 cts.

Flow of Water over Dams. By Gardner S. Williams, Prof. of Civil, Hydraulic and Sanitary Engineering in University of Michigan. 1-3-4 pp., The Canadian Engineer, Mar. 9, 10 cts.

Stream Metering on the Ottawa. Illustrated, 2 pp., Canadian Engineer, Mar. 30, 15 cts.

Aqueduct, Construction of the Kensico By-Pass. By H. W. Nelson. Illustrated, 4 pp., Engineering Record, April 1, 10 cts.

The Hudson Tunnel of the Catskill Aqueduct for the Water Supply of New York City. By Alfred S. Flinn, Dept. Engineer, Board of Water Supply, New York City. Illustrated, 3 pp., Engineering News, Mar. 23, 15 cts.

A Cave at the Hunter's Brook Tunnel on the Catskill Aqueduct of the New Water-Works for New York. By Arnold Becker. Illustrated, 11-3 pp., Engineering Record, Mar. 18, 10 cts.

The Under-City Tunnel for Delivering Catskill Water to the Distributing Mains of New York. Illustrated, 2 pp., Engineering-Contracting, Mar. 8, 10 cts.

Elizabeth Tunnel, Los Angeles Aqueduct. By B. A. Heintz. Illustrated, 3-4 pp., Municipal Journal and Engineer, Mar. 22, 10 cts.

Longest American Aqueduct. By E. P. Bailey. Illustrated, 6 pp., Cement World, March, 15 cts.

Leakage of Cabin John Bridge. Illustrated, 1 p., Engineering Record, April 1, 10 cts.

Lead Lining for Waterproofing an Aqueduct Bridge. Illustrated, 1 p., Engineering Record, Mar. 25, 10 cts.

Storage, Proposed Water, on the Genesee River for Flood Prevention and Amelioration of Low Water Conditions. By A. H. Perkins. Illustrated, 2 pp., Engineering News, Mar. 16, 15 cts.

Reservoir Site, Grubbing Stumps on. By Victor F. Hammel. Illustrated, 3 1-4 pp., The Contractor, Mar. 1, 20 cts.

A Concrete Reservoir Built on Soft Ground. Illustrated, ½ p., Engineering Record, Mar. 4, 10 cts.

Dam, Extension of the Sweetwater. By J. D. Schuyler. Illustrated, 3½ pp., Engineering News, Mar. 30, 15 cts.

Cost Data on the New Croton Dam. Portion of a paper by Edward Wegmann and J. B. Goldsborough, read at Annual Convention of the American Society of Engineering Contractors. Illustrated, 3 pp., The Contractor, Mar. 15, 20 cts.

The Morris Dam of the Waterbury, Conn., Water Supply Extension. Illustrated, 2 pp., Engineering News, Mar. 23, 15 cts.

Contractors' Camps at the Ashokan Reservoir. Illustrated, 2 pp., Engineering Record, Mar. 25, 10 cts.

Steel Pipe, Repairing a. Illustrated, 1-4 p., Municipal Journal and Engineer, April 5, 10 cts.

The Durability of Welded Steel Pipe. Paper before Annual Meeting of American Society of Heating and Ventilating Engineers. By F. N. Speler. 1 p., Engineering News, Mar. 23, 15 cts.

Dimensions of Riveted Steel Pipe. By N. A. Carle. Illustrated, 3 pp., Power, Mar. 7, 5 cts.

Pumping Station, The Evolution of a. By Theodore A. Leisen. 4 pp., Municipal Engineering, March, 50 cts.

A Municipal Pumping Plant Using Producer Gas. By Raymond C. Allen, C.E. 4 pp., Municipal Engineering, March, 50 cts.

Turbine Pumping Units in the Indianapolis Water Works. Illustrated, 6 pp., Municipal Engineering, April, 25 cts.

Present Day Pumping Engine for Water Works. By C. A. Hague. Illustrated, 17 pp., Proceedings of American Society of Civil Engineers, March, \$1.

Water Tower Abandoned, St. Louis. Illustrated, 1-3 p., Municipal Journal and Engineer, April 5, 10 cts.

Devices in Water Works Plants, Labor Saving. By Frank C. Jordan, Secretary Indianapolis Water Co. 2 pp., Municipal Engineering, March. 50 cts.

Methods Used in Obtaining Concrete of Maximum Density for the Westerly, R. I., Standpipe. Remarks before Boston Society of Civil Engineers. By Angus B. MacMillan. Illustrated. 1 p., Engineering-Contracting, Feb. 15. 10 cts. Illustrated, 2 pp., Concrete, March. 15 cts.

Purification, Water. By J. C. Mahr, State Commissioner of Health. Illustrated, 2 pp., The Canadian Engineer, Mar. 16. 10 cts.

Modern Methods of Purification of Public Water Supply. Discussion before Royal Sanitary Institute. 3 pp., Surveyor, Mar. 24. 25 cts.

Operating Results, Cincinnati Water Purification Works. 12-3 pp., Engineering Record, Mar. 18. 10 cts.

Successful Treatment of White River Water. Paper before Indiana Sanitary and Water Supply Association. By Henry Drach. 1 p., Fire and Water, Mar. 22. 10 cts.

Water Sedimentation in Poughkeepsie. 1-3 p., Municipal Journal and Engineer, Mar. 8. 10 cts.

Water Filtration for Industrial Purposes. By Churchill Hungerford. 15½ pp., The Journal of the Franklin Institute, March. 50 cts.

Fort Collins Filtration Plant. By W. D. Vosburg. Illustrated, 1 p., Engineering Record, April 1. 10 cts.

Construction of Springfield Filters. Paper before Boston Society of Civil Engineers. By Chas. R. Gow. Illustrated, 5½ pp., The Contractor, Mar. 1. 20 cts.

Water Filtration at Peekskill. Covered slow sand filters and aerator and covered filtered water reservoir; details and cost of construction; results. Illustrated. 5 pp., Municipal Journal and Engineer, April 5. 10 cts.

Effect of Filters on Typhoid Rates. Illustrated, 1-4 p., Municipal Journal and Engineer, Mar. 8. 10 cts.

Double Filtration of Water. By H. W. Clark, Chemist Massachusetts State Board of Health. ½ p., Surveying and the Civil Engineer, Mar. 17. 15 cts.

Practice in the Use of Hypochlorite of Lime. By H. E. Jordan. 11-3 pp., Fire and Water, Mar. 22. 10 cts.

Amount of Chlorine for Sterilizing. 1-4 p., Municipal Journal and Engineer, Mar. 8. 10 cts.

Corrosion of Hot Water Pipes. The Cause of Internal. By M. J. Falkenburg. Illustrated, 2-3 p., Engineering News, Mar. 23. 15 cts.

Water Meters, Ownership, Care, Repair and Reading of. By E. W. Bemis. 2 pp., Engineering Record, Mar. 25. 10 cts.

The Purchase, Setting and Testing of Water Meters. By Edward W. Bemis. 2 pp., Engineering Record, Mar. 4. 10 cts.

How Meters Safeguard Water Supplies. 1 p., Fire and Water Engineering, Mar. 15. 10 cts.

Meter Installation and Maintenance. ½ p., Municipal Journal and Engineer, Mar. 22. 10 cts.

Value of Water Meters. Paper before Convention, League of Nebraska Municipalities. By H. D. Mead, Water Commissioner, Chadron, Neb. 3 pp., Midland Municipalities, March. 10 cts.

Water Surveys of the City of Chicago. Paper before Illinois Water Supply Association. By T. C. Phillips. Illustrated, 12-3 pp., Engineering Record, Mar. 4. 10 cts.

Rate Making, Water. Items included in income which must be raised; apportioning rates among consumers; ready to serve charge. Abstract of paper by F. C. Jordan before Illinois Water Supply Association. 1 p., Municipal Journal and Engineer, Mar. 8. 10 cts. 3 pp., Municipal Engineering, April. 25 cts. 1 p., Fire and Water, April 5. 10 cts.

Water Rates in Duluth. ½ p., Municipal Journal and Engineer, Mar. 22. 10 cts.

Valuation of the Physical Property of the Peoria Water Co., with a Discussion of Rate Making and of Reasonable Rates. 3 pp., Engineering-Contracting, Feb. 15. 10 cts. 4 pp., Mar. 8. 10 cts. 4 pp., Mar. 15. 10 cts.

Method of Determining the Going Value of Water Works. From paper before American Society of Civil Engineers. By Leonard Metcalf and J. W. Alvord. 6 pp., Engineering-Contracting, Mar. 29. 10 cts.

Depreciation in Water Works Operation. By Leonard Metcalf. 21-4 pp., Public Service, March. 20 cts.

Responsibility for Death Caused by Polluted Water. 1 p., Engineering Record, Apr. 8. 10 cts.

Grouting the Oliver Bridge Dam. Illustrated, 11-3 pp., Engineering Record, Apr. 8. 10 cts.

STREET LIGHTING AND POWER PLANTS

Street Lighting at Cincinnati, Ohio, Ornamental. Illustrated, 5 pp., Municipal Engineering, March. 50 cts.

Indoor Street Lighting. By R. E. Campbell. Illustrated, 2 pp., The Illuminating Engineer, March. 20 cts.

Electric Street Lighting. By Albert Schible. 3 pp., Electrical Review, April 1. 10 cts.

Lighting System Report. By the city electrician of Winnipeg, F. A. Cambridge. 11-3 pp., The Western Municipal News, March. 10 cts.

Arc Light in Illumination, The Place of the. By R. E. Pierce. 3½ pp., The Illuminating Engineer, March. 20 cts.

Illumination. Paper before National Commercial Gas Association. By Norman McBeth. Illustrated, 7 pp., American Gas Light Journal, April 3. 10 cts.

A Year's Progress in Illuminating Engineering. By E. Leavenworth Elliott. 9 pp., The Illuminating Engineer, March. 20 cts.

Conduit Construction in Downtown New York, Underground. By S. D. Levings. Illustrated, 41-3 pp., Electrical Review and Western Electrician, Mar. 11. 10 cts.

Manufacture of Illuminating Gas, Recent Municipal Improvements in the. By Jacques Boyer. Illustrated, 18 pp., The Engineering Magazine, March. 25 cts.

Holder Construction, Recent Improvements in. By J. Alex. Mayers. Illustrated, 11-2 pp., American Gas Light Journal, Mar. 6. 10 cts.

Gas Main under Harlem River, Laying a 48-in. By C. C. Simpson. Illustrated. 3 pp., The Canadian Engineer, Mar. 9. 10 cts.

Pneumatic Caulking with Lead Wool of 30, 36 and 48-in. Mains. Illustrated, 3½ pp., American Gas Light Journal, Feb. 20. 10 cts.

Rates, Gas, and Politics in Chicago. By Glenn Marston. 21-4 pp., Public Service, March. 20 cts.

The Real Theory of Real Electric Rates. By R. S. Hale. 13 pp., General Electric Review, April. 20 cts.

Faulty Data and Misleading Analysis of Data. Paper before American Gas Institute. By Dr. A. C. Humphreys. 3 pp., Progressive Age, April 1. 20 cts.

The Decision of the Railroad Commission of Racine in the Racine Case. Illustrated, 41-4 pp., American Gas Light Journal, Mar. 20. 10 cts.

Lamps, New Metallic Filament. By G. S. Merrill. Illustrated, 23 pp., Journal of the Franklin Institute, April. 50 cts.

Electric Plant, South Norwalk Municipal. 1-4 p., Municipal Journal and Engineer, Mar. 22. 10 cts.

Hydro-Electric Practice. By H. A. von Schon, Consulting Engineer, Detroit. Illustrated, 4 pp., Municipal Engineering, March. 50 cts.

FIRE AND POLICE

Fire Protection in Small Towns and Villages. By J. E. Buchanan, Chief, Winnipeg Fire Dept. 11-4 pp., The Western Municipal News, March. 10 cts.

New York and Its Fire Protection. Illustrated. 11-3 pp., Fireman's Herald, Mar. 11. 5 cts.

Window Protection. Boston and Cincinnati Fires. Illustrated, 4 pp., Insurance Engineering, February. 25 cts.

Good Fire Protection at Terra Haute. From Report of National Board of Fire Underwriters. 11-3 pp., Fire and Water, April 5. 10 cts.

Fireproof Construction. By Philip H. Bevier. Illustrated, 7 pp., Insurance Engineering, February. 25 cts.

Fire Hazard Standpoint, Modern Garage from a. By N. B. Pope, 1½ pp., Fire and Water, April 5. 10 cts.

Fire Analyzed. From an address by W. H. Merrill. 3 pp., Insurance Engineering, February. 25 cts.

Fires, Warehouse. Illustrated, 8 pp., Insurance Engineering, February. 25 cts.

New York City Factory Holocaust. Illustrated, 3 pp., Fireman's Herald, April 1. 5 cts. Illustrated, 1 p., Fire and Water, Mar. 29. 10 cts.

Fire Drills to be Compulsory in New Jersey. 1 p., Fire and Water, Mar. 29. 10 cts.

Department, Mobile's Efficient Fire. Illustrated, 1 p., Fireman's Herald, Mar. 4. 5 cts.

Methods, Prussian Fire. By Alcide Chausse. 8 pp., Insurance Engineering, February. 25 cts.

Association, The National Fire Protection, and its Work. Abstract of address before National Association of Cement Users. By W. H. Merrill. 2 pp., Cement, February. 20 cts.

Purpose and Work of the Underwriters' Laboratory. Paper before International Association of Fire Engineers. By W. H.

Merrill. ½ p., Engineering News, Mar. 30. 15 cts.

Police Dog, The German, and What He Does. Illustrated, 1½ pp., American Review of Reviews, April. 25 cts.

GOVERNMENT AND FINANCE

Commission Government in the Far West. ½ p., Municipal Journal and Engineer, Mar. 22. 10 cts.

Commission Plan of City Government Propaganda in New York and New Jersey. 2-3 p., Engineering News, Mar. 16. 15 cts.

Initiative and Referendum Defects. Illustrated, 2 pp., Public Service, March. 20 cts.

Charter, The Indianapolis. By Augustus Lynch Mason. 6 pp., The Public Officials Magazine, February. 10 cts.

Municipal Law, Iowa. By A. W. Osborne. 3 pp., Midland Municipalities, April. 10 cts.

Voting, Preferential System of. 1-3 p., Municipal Journal and Engineer, April 5. 10 cts.

Municipal Ownership in Calgary. 1-4 p., Municipal Journal and Engineer, Mar. 22. 10 cts.

Efficiency Records in the Civil Service of the City of New York. By Leonhard Felix Fuld, Examiner, New York Municipal Civil Service Commission. 3½ pp., The American City, March. 15 cts.

Milwaukee Bureau of Economy and Efficiency. By P. H. Myers. 1 p., Engineering News, Mar. 30. 15 cts.

Accounting, Municipal. By Charles F. Gettemy, Director of Massachusetts Bureau of Statistics. 6 pp., The Journal of Accounting, March. 25 cts.

REFUSE DISPOSAL

Refuse Disposal. Annual review of progress in. 4 pp., Surveyor, Jan. 27. 20 cts.

Garbage, Disposal of, at Newport. 1-p., Municipal Journal and Engineer, Mar. 29. 10 cts.

Incinerator, Milwaukee. An explanation. 1-4 p., Municipal Journal and Engineer, Feb. 8. ½ p., Mar. 29. 10 cts.

Installation of an Incinerator. By J. A. Stewart, manager, Edmuntion incinerator. 2 pp., Canadian Engineer, Feb. 2. 15 cts.

Incinerator Construction. By George I. Bliven, M.E. Illustrated, 33-4 pp., Pacific Builder & Engineer, Feb. 4. 15 cts.

The Technique of Combustion and Production of Energy from Municipal Wastes. By Frederick Meyer. Illustrated, 6 pp., La Technique Sanitaire, March. 50 cts.

The Garbage Crematory at Houston, Texas. Paper before a convention of Health Officers of Texas. By David M. Duller, City Engineer. Illustrated, 4 pp., Municipal Engineering, March. 50 cts. Illustrated, 2½ pp., Canadian Engineer, Mar. 30. 15 cts.

Gas Fired Animal Crematory at Boston. By Huntington Smith. Illustrated, 1 p., Progressive Age, Jan. 16. 20 cts.

Reduction Plant, Municipal Garbage, at Columbus, O. Illustrated, 4 pp., Municipal Engineering, April. 25 cts.

BRIDGES AND MATERIALS

Highway Bridges from the Investment Point of View. Address before Ontario Good Roads Association. By C. R. Young. 2 pp., Engineering Record, Mar. 18. 10 cts.

3 pp., The Canadian Engineer, Mar. 16. 10 cts. 2 pp., Engineering-Contracting, Mar. 15. 10 cts.

Municipalities and Highway Bridges. By C. R. Young. 3 pp., Contract Record, Mar. 29. 15 cts.

The Bridges of Nova Scotia. Illustrated. 2 pp., The Canadian Engineer, Mar. 16. 10 cts.

Highway Bridge Built of Separately Molded Members. Illustrated, 2 pp., Engineering Record, Mar. 25. 10 cts.

Concrete Abutments for Highway Bridges. Diagrams for determining quantities and cost. Paper before Illinois Society of Engineers and Surveyors. By H. E. Bilger. Illustrated, 3 pp., Engineering-Contracting, Feb. 15. 10 cts. Illustrated, 2 pp., Engineering Record, Mar. 18. 10 cts.

Substructure of the Municipal Bridge over the Mississippi River at St. Louis, Mo. By S. W. Bowen. Illustrated, 32-4 pp., Engineering News, Mar. 16. 15 cts. Illustrated, 8 pp., Engineering-Contracting, Mar. 8. 10 cts.

Concrete-Filled Steel Arches; Steel is Reinforced with Concrete. Paper before N. A. C. U. Convention. By Henry H. Quimby. Illustrated, 3 pp., Concrete, March. 15 cts. Illustrated, 23-4 pp., Good Roads, March. 10 cts.

Specifications, Relation of Bridge, to Highway Improvements. Paper before Indiana Engineering Society. By Albert Smith. 3 pp., Municipal Engineering, April. 25 cts.

Viaduct, Dallas, Oak Cliff. By V. H. Cochrane. Illustrated, 3 pp., Engineering Record, Apr. 1. 10 cts.

(Continued next week.)

THE WEEK'S CONTRACT NEWS

relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

Table with columns: STATE, CITY, RECEIVED UNTIL, NATURE OF WORK, ADDRESS INQUIRIES TO. Includes sub-sections for STREET IMPROVEMENTS and SEWERAGE.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
WATER SUPPLY				
Illinois	Aurora	Apr. 11	Furnishing and installing boilers; separate bids for one and two boilers respectively to be safety water tube type of about 230 h.p. each, and for working pressure of 150 lbs.	T. D. Stimson, Supt. Water Dep.
Maine	Ft. McKinley	Apr. 15	Constructing chemical water softening plant.	Capt. Jos. F. Gohn, Con. Q.M.U.S.
Ohio	Cleveland	Apr. 15, noon	Constructing water main in Kinsman road, Newburg.	J. W. Shimek Clk. Bd. Control.
New York	Pulton	Apr. 17, 8 p.m.	Furn. 740,000 lbs. pipe and 5,000 lbs. standard castings.	J. A. Foster, Pres. Bd. Pub. Wks.
Ohio	Niles	Apr. 18, noon	Constructing 3,000,000 gal. filtration plant.	F. M. Brewer, City Engineer.
California	San Francisco	Apr. 20	Constructing dam 200 ft. high.	Michael Casey, Pres. Bd. Pub. W.
Montana	Helena	Apr. 20, 8 p.m.	Con. water works system, reservoir, pipe line & distri. system.	J. A. Mattson, City Clk.
North Carolina	Morehead	Apr. 20	Installing water works.	G. D. Canfield, Chm. W. W. Con.
Dist. of Col.	Washington	Apr. 21, 2 p.m.	Furn. 2,411 tons 16 and 20-in. cast iron water pipe; and 90 tons cast iron water pipe specials.	Cuno H. Rudolph, Comr.
North Dakota	Fargo	Apr. 27	Furnishing a high duty crank and fly wheel pumping engine with a capacity of 4,000,000 gals. each 24 hours; constructing a water purification plant complete 4,000,000 gals daily.	E. R. Orchard, City Auditor.
Ohio	Toledo	Apr. 27	Installing complete high pressure fire system including c. i. pipe, hydrant etc., except the pumping station, machinery, etc.	F. Shane, Secy. Bd. Pub. Service.
Pennsylvania	Somerset	Apr. 27	Constructing a reservoir.	Chas. I. Shaver, Secy. Boro. Cou.
Florida	Fort Dale	Apr. 29, 10 a.m.	Constructing extension of water system.	Construct. Quartermaster, U.S.N.
New Jersey	Skillman	May 1, 10:15 a.m.	Extending water system, together with necessary hydrants, gates, valves, etc., at Village for Epileptics.	Jonas A. Fuld, Secy. Bd. Manager.
BRIDGES				
Pennsylvania	Chambersburg	Apr. 14, 11 a.m.	Erecting reinforced concrete bridge over Muddy Run.	E. K. Raff, Clk. County Comrs.
Indiana	Decatur	Apr. 14	Constructing the Abe Egley bridge.	Board of Co. Comrns.
Oregon	Portland	Apr. 14, 2 p.m.	Constructing the West Portland Bridge.	F. S. Shields, County Clerk.
Wisconsin	Kenosha	Apr. 15, 4 p.m.	Rebuilding and altering Middle St. Bridge.	R. H. Moth, City Engr.
Kansas	Lawrence	Apr. 15, noon	Constructing 2 stone abutments and 32-ft. girder span.	W. R. Green, County Clerk.
Idaho	Moscow	Apr. 15, noon	Constructing bridge across Paradise Creek.	Homer E. Estes, Clk. Bd. Co. Com.
New Mexico	Las Vegas	Apr. 17	Constructing 3 bridges.	Lorenzo Delgado, Probate Clerk.
Ohio	Warren	Apr. 17, 1 p.m.	Construct concrete bridge over Little Squaw Creek, Liberty twp.	Fred T. Stone, County Auditor.
Kentucky	Paducah	Apr. 17	Constructing a rein. conc. bridge 43 ft. wide and 295 ft. long.	L. A. Washington, City Engr.
Ohio	Niles	Apr. 17, 1 p.m.	Constructing concrete bridge over Little Squaw Creek.	Fred T. Stone, County Au. Itor.
Texas	Galveston	Apr. 17, 11 a.m.	Constructing reinforced concrete bridge.	John M. Murch, County Auditor.
Pennsylvania	Wilkes Barre	Apr. 18, 2 p.m.	Constructing sixty bridges.	James M. Norris, County Com.
Pennsylvania	Easton	Apr. 18	Constructing a reinforced concrete bridge.	Comrs. Northampton County.
Illinois	Aurora	Apr. 20, 2 p.m.	Constructing a new bridge.	City Clerk.
Ohio	New Lexington	Apr. 24	Constructing bridge over Rush creek.	Auditor Perry County.
Illinois	E. St. Louis	Apr. 25	Constructing 5 railroad bridges in Madison County.	H. D. Sexton, Pres. Bd. Trustees.
LIGHTING AND POWER				
Alabama	Troy	Apr. 17	Furn. 1 stationary steam engine, 400 H P., 150 lbs. initial pressure; 1 electric generator, 250 kva., 60 cycles 3-phase, 2,300 volts; 1 pump, electrically driven capacity not less than 500 gals. per minute against 200 lbs. working pressure; 1 motor to drive pump; transmission line material for 3-phase line 3 1/2 miles long, size of wire No. 4 B&S.	A. B. Campbell, Supt. E. & W.D.
Ohio	Dayton	Apr. 20, noon	Ornamental lighting with electricity portions of various streets	J. C. Ely, Dir. Pub. Service.
Manitoba, Can.	Winnipeg	May 1, 11 a.m.	Furnishing ornamental lighting standards.	Magnus Peterson Secy. Civic B. C.
California	Benicia	May 1	Furn. elec. supplies for year ending June 30.	Lieut.-Col. J. W. Benet, Com. Off.
FIRE EQUIPMENT				
Sask., Can.	Regina	Apr. 17	Furn. combination hose and chemical wagon; 1,700 feet double jacket rubber lined fire hose; 2 hydrant gate valves; two plays pipes and other apparatus.	A. J. McPherson, City Comr.
Alberta, Can.	Calgary	Apr. 20, noon	Furnishing one combination motor fire engine and hose wagon; one motor hose wagon, one motor 85-ft. aerial truck.	W. D. Spence, City Clerk.
New Jersey	Paterson	Apr. 21	Furn. automobile hook and ladder outfit and converting 2 first-class fire engines into gasoline-propelled vehicles.	T. S. Standeven, City Clk.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Updike, Chm. F. & W. Con.
MISCELLANEOUS				
Utah	Eureka City	Apr. 14	Constructing a jail.	E. W. Redmond, City Recorder.
Kansas	Hutchinson	Apr. 14, 3 p.m.	Sprinkling various streets.	Ed Metz, City Clerk.
Ontario, Can.	Goderich	Apr. 15	Erect. municipal building Combined Town Hall and Fire Hall.	L. L. Knox, Town Clerk.
Wisconsin	Richland Center	Apr. 18, 7:30 p.m.	Erecting 110-ft. or 125-ft. brick or concrete chimney.	City Clerk.
New Jersey	S. Orange	Apr. 18	Oiling about 8 miles of street during coming season.	William H. Kemp, Chm. Twn. C.
Washington	Pasco	Apr. 18	Constructing reinforced concrete city hall; also furn. two street sprinklers, and one flusher.	L. H. Koontz, City Clk.
Indiana	Indianapolis	Apr. 20, 10 a.m.	Repairing Guardians' Home; and Marion County Asylum for Poor; also furnishing 1 road scraper with scarifier attach.	Albert Sahn, County Auditor.
West Virginia	Moorefield	Apr. 20, 11 a.m.	Constructing new county court house.	C. B. Welton, Clk. County Court.
Georgia	Waycross	Apr. 20, noon	Constructing jail and jailer's home.	H. J. Berry, Clk. C. R. D. & Rev.
Montana	Glendive	Apr. 21	Constructing new concrete jail, and construct. steel cells.	R. L. Wyman, Clk. Bd. Coun. Cor.
South Africa	Johannesburg	Apr. 21, noon	Furn. 2 patrol motor fire engines.	Town Clerk.
Pennsylvania	Reading	Apr. 24, noon	Constructing new library buildings.	Chas. H. Hunter, Secy. B-1. Trus.
Massachusetts	Boston	Apr. 24	Disposal of the refuse of the city collected by the Public Works Department, except W. Roxbury and E. Boston Dists. for a term of ten years.	Louis K. Rourke, Comr. Pub. W.
Michigan	Grand Rapids	Apr. 29, 3 p.m.	Repairing and construct. piers at various harbors in Michigan.	C. S. Riche, Lieut. Col. Engrs.
Ohio	Cincinnati	May 10, noon	Constructing hospital buil. lings.	Messrs. Hannaforl & Sons, A.
California	Oakland	May 11	Constructing city hall, value of contract \$1,000,000.	Frank R. Thompson, City Clerk.

STREET IMPROVEMENTS

Clarksville, Ark.—Johnson County Commissioners have selected Civil Engineer W. A. Reams, Fort Smith, Ark., to make survey for proposed roads improvement.

Little Rock, Ark.—Bids will soon be asked for twelve blocks of wood block paving, at an approximate cost of \$45,000, in West 23d st. Improvement Dist.—W. F. Reichard, 204 Riegler Bldg., Engineer.

Los Angeles, Cal.—Improvement of Wilshire Boulevard with bitulithic pavement is being considered.

Stockton, Cal.—San Joaquin Highway Commission is planning oiling of three roads; plans and specifications will be prepared for oiled macadam on four roads; bids will soon be asked for asphalt macadam work on North Stockton road, Copperopolis and French Camp roads.

Washington, D. C.—District Commissioners have decided to expend \$167,000 on resurfacing Corcoran, Hh, O, M, 15th, 19th and numerous other streets.

New Castle, Del.—Council received no bids April 3 for \$30,000 street paving bonds.

Wilmington, Del.—Bids will be received April 18, noon, for \$80,000 highway improvement bonds. Daniel Thompson, Chairman, Finance Committee.

Brooksville, Fla.—Town will vote April 25 on \$2,000 bond issue for constructing sidewalks and \$7,000 for paving streets.—W. A. Thaxton, Town Clerk.

Summerville, Ga.—Citizens have voted \$75,000 bonds for street, sewer and water improvements.

Nezperce, Ida.—Town Trustees have decided to macadamize number of streets at once; bids asked.

Harrisburg, Ill.—Township has voted \$35,000 bonds to build rock roads.

Peoria, Ill.—Contracts will soon be let for paving with brick portions of 6th ave., South and Sanford sts.

Bluffton, Ind.—Petition has been filed in Wells Commissioners' Court asking for stone road about 1 1/4 miles long on Wells-Adams county line, south of Vera Cruz.

Evansville, Ind.—Bids will be received

by Board of Public Works on improvement of four alleys.

Evansville, Ind.—Paving of Blackk ave., between Garvin and Kentucky av. has been ordered.

Greensburg, Ind.—Council will soon for bids for paving with brick Main st.

Michigan City, Ind.—Plans and specifications are being prepared for paving Bmore st., Wabash st. and Willard ave.—R. Miles, City Engineer.

Richmond, Ind.—Wayne County Commissioners will soon ask for bids for improvement of National road west of city to the center township line.

Mount Sterling, Ky.—Council has ordinances providing for construction 11,250 sq. yd. of brick streets in busi section of the city; cost, \$1.75 per sq. yard.

Winfield, La.—Road Commission of W Parish has planned about 635 miles of r improvement to cost \$50,000.

Oakfield, Me.—Town has appropriated \$1,500 for highways.—H. P. Sprague, T. Clerk.

Perham, Me.—Town has appropriated \$1,600 for highways.—A. A. Spaulding, Town Clerk.

Baltimore, Md.—Council has passed ordinance providing for harbor front boulevard or South Baltimore; plans by Harbor Engineer Lackey call for street 106 ft. wide throughout length; also for construction of pier at Hughes and Covington sts.

Cambridge, Mass.—Mayor J. Edward Barry has recommended replacing of gravel sidewalks with brick or granolithic.

Marblehead, Mass.—Town has appropriated \$50,000 for macadamizing 10 miles of town roads; \$3,500 for granolithic sidewalk t causeway and \$2,000 to make repairs on train at Clifton. John G. Stevens, Chairman Selectmen.

Whitinsville, Mass.—Town has appropriated \$5,500 for highways and small bridges.

F. Gilleland, City Engineer.

Newport, Ky.—Construction of sewer to McClane & Sons, as follows: Putnam st. \$378.46; 3d st., between Isabella and Central ave. \$750.15; German st., between 9th and 10th sts., \$1,062.35, and German st. between 10th and 11th sts., \$822.90.

North Platte, Neb.—Constructing sewer in Sewer Dists. G3 and G4, P and F, to C. R. McKay, 528 Faxon Blk., Omaha, about \$6,000.

Niagara Falls, N. Y.—Building sewer in North ave., to Wm. Ruffran, \$7,994.

Yonkers, N. Y.—To O'Rourke Constr. Co. for constructing sewer in Alexander st., between Ashburton and Wells aves., \$4,094; other bidders: McDonald & Murray, \$4,658; Nicholas Mangini, \$5,075; Joseph Cuzzo, \$4,743.15; Thomas Grady, \$4,750; Frank Cianfagione, \$4,850.

Minot, N. D.—Building North Side sewer system, to G. W. Kemper, city, \$29,925.83; other bidders: Illstrup & Olson, Minneapolis, \$31,854.00; G. W. Haggert, St. Paul, \$31,326.57; C. H. Porritt, Fargo, \$31,549.78; Margee Johnson, Minneapolis, \$31,986.07.

Chester, Pa.—Constructing spurs and sewers, to Pritchard & Oliver; 8-in. terra cotta pipe, \$1.42; 12-in., \$1.45; 15-in., \$1.55; 18-in., \$1.70; rock, \$4.75; manholes, \$39.50; other bidders: E. H. Butler, 8-in. \$1.67, 10-in. \$1.72, 12-in. \$1.77, 15-in. \$1.84, 18-in. \$1.96, rock \$5, manholes \$39; J. & J. Hanna, 8-in. \$1.45, 10-in. \$1.48, 12-in. \$1.52, 15-in. \$1.57, 18-in. \$1.70, rock \$4.75, manholes \$40; W. E. Reiley, 8-in. \$1.59, 10-in. \$1.59, 12-in. \$1.65, 15-in. \$1.65, 18-in. \$2.25, rock \$4.20 cu. yard, manholes \$37. Sewer on Central ave., Seventh to Twelfth st., to Pritchard & Oliver, 96c. per ft.; Y branches, 45c. each, manholes \$39.50, rock \$4.50 cu. yd.; other bidders: John Hanna Sons, 8-in. terra cotta pipe, 98c. per ft., Y branches 45c. each, manholes \$40, rock \$4.75 cu. yd.; E. H. Butler, 99c. per ft., Y branches 44c. each, manholes \$36, rock \$5 cu. yd.; Seventh st., Highland ave. to Wilson st., to John Hanna's Sons, 94c. per ft., branches 45c. each, manholes \$40, rock \$4.75; other bidders: E. H. Butler, 8-in. terra cotta

pe 97c., branches 44c. each, manholes \$3, rock 45 cu. yd. W. E. Reilly, \$1 per 4, branches 50c. each, manholes \$36, place nks \$100, rock \$4; Pritchard & Oliver, 3 ft., branches 45c. each, manholes 950, rock \$4.50 cu. yd.
Valley Camp, Pa.—Building sewage disposal plant, to Pitt Construction Co., Pittsburg.—Chester & Fleming, Union Bank Bldg., Pittsburg, Engineers.

WATER SUPPLY

Ashville, Ala.—Town is considering construction of water works.
Bisbee, Ariz.—City Trustees will shortly award contract for drilling wells and constructing pumping plant; considerable canal work will also be constructed.—Harry E. Lake, Los Angeles, Cal., Surveyor.
San Francisco, Cal.—City Engineer Marsen Manson has prepared plans for building two sections of intake tunnel for Townsend L. pumping station.
Orlando, Fla.—Orlando Water & Light company contemplates the installation of 2,000,000-gallon per day Underwriters pump.
Flowery Branch, Ga.—Installation of water works is being considered; estimated cost, about \$6,000.—C. R. Parson, Mayor.
Summerville, Ga.—Citizens have voted 75,000 bonds for water, street and sewer improvements.
Thomaston, Ga.—Citizens will vote May 1 n \$45,000 bonds for construction of water works and sewerage system.
Mountain Home, Ida.—Citizens have voted 15,000 bonds for constructing city water system; E. M. Blake, Boise, has made preliminary survey.
Rockdale, Ill.—Village has decided to install municipal water plant and lay mains in all streets.
Westfield, Ill.—Plans and specifications are being prepared for water works and sewerage system for village; will be ready about May 1.—W. R. Paige, 101-2 Rose dispensary Bldg., Terre Haute, Ind., Consulting Engineer.
Gilmore City, Ia.—Citizens will vote on installation of waterworks.
Nevada, Ia.—Installing water works system, to Guy E. Smith, Indianola.
Burden, Kan.—Rolling & Westover, Consulting Engineers, Beals Bldg., Kansas City, Mo., are preparing plans for installation of system of water works; estimated cost \$15,000.
Horton, Kan.—Town has voted \$55,000 bonds to purchase water and light plant.
Bowling Green, Ky.—Council has requested State Sanitary Engineer Paul Hansen to submit plan for improvement of filtration plant at water works.
Baltimore, Md.—Council has authorized Water Board to lay pipes and supply water n Baltimore County.
Cumberland, Md.—Citizens will vote May 6 on \$500,000 of bonds for new water supply; plans by Engineer J. H. Fuertes, New York, call for gravity supply from Swifts Creek, about nine miles from city; water is to be filtered in open reservoir; daily supply, 6,000,000 gallons.
Athol, Mass.—Town is planning the construction of water works system; James L. Tighe, Holyoke, has been selected as engineer.
Cambridge, Mass.—Mayor J. Edward Barry has recommended increased water supply.
Uxbridge, Mass.—Bids will be received about April 15 for laying water mains; estimated cost, \$8,000.—W. E. Rawson, Superintendent Water Works.
Benton Harbor, Mich.—Citizens have defeated proposition to issue \$100,000 bonds for improvement of water works.
Big Rapids, Mich.—Citizens have defeated proposition to expend \$20,000 for repair of water works.
Ely, Minn.—Citizens have voted \$30,000 bonds to provide for water supply distribution and to extend sewer system.
North Mankato, Minn.—Citizens have voted \$20,000 bonds for construction of water works system.
Waseca, Minn.—Citizens have voted \$15,000 bonds for water works extension.
Bassfield, Miss.—Citizens have voted bonds to install water works system.
Seminary, Miss.—Citizens have voted \$10,000 bonds for installation of water works system and erection of school.
Fallon, Nev.—Construction of water works, a sewer system and electric light plant is being considered.—M. L. Wildes, Mayor.
Rahway, N. J.—Consulting Engineer Chas. A. Hague, New York, has recommended installation of cross-compound, high duty, crank and fly wheel pumping engine.
Cortland, N. Y.—Water Board will soon ask for bids for construction of proposed new water tank, capacity 1,000,000 gals.—D. B. Coleman, City Engineer.

Geneva, N. Y.—City is considering the improvement of water works system; estimated cost \$125,000.—C. T. Church, City Engineer.
Rockville Centre, L. I., N. Y.—Village has voted \$7,500 for improvement of water system and roads.
Waterbury, L. I., N. Y.—New bids will be asked for furnishing engines for water plant.
Andrews, N. C.—City is considering \$20,000 bond issue for water works, electric lights and street improvements.
Red Springs, N. C.—Bids will be received April 27 for \$25,000 water works and sewerage bonds.—A. B. Pearsall, Chairman Board Public Works.
Cincinnati, O.—Council has passed ordinance authorizing \$100,000 bond issue for water works improvement.
Logan, O.—Village is preparing to construct system of water works.—H. S. Vance, Village Engr.
Mansfield, O.—Anton Burchard, Cleveland, is preparing plans for water works pumping station to be constructed at Hedges Springs; cost, about \$18,000.
Urbana, O.—City has sold \$100,000 water works bonds to install plant.
Boswell, Okla.—Citizens have voted \$35,000 bonds for installation of water works and electric light plant.
McAlester, Okla.—Citizens will vote April 22 on \$80,000 bonds for extensions of water system.
Waynoka, Okla.—Citizens have voted \$27,000 bonds for construction of water works.
Carlton, Ore.—City has employed engineers who are now surveying a pipe line to tap Panther Creek, nine miles west, and will furnish water for all purposes; it is proposed to construct reservoir on what is known as Wennerberg's Hill.
Klamath Falls, Ore.—Mayor Sanderson has vetoed the water, light and power franchises passed by Council in favor of the Klamath Falls Light & Power Co.
Pottstown, Pa.—Pottstown Water Co. will lay larger mains in several portions of town.
South Sharon, Pa.—Council is considering installation of water plant; cost, about \$160,000.
Springdale, Pa.—Citizens have voted \$50,000 bonds for water works, \$12,000 toward constructing sewers and \$10,000 for grading streets and alleys.
Dillon, S. C.—Installation of \$80,000 water works is being considered.
Clarksville, Tex.—Citizens will vote on \$10,000 bonds to extend water mains.
Norfolk, Va.—Council is considering securing of larger water supply.
Kelso, Wash.—Council has granted water and light franchises to Washington-Oregon Corporation.
Racine, Wis.—Citizens have voted to purchase water works.

Chicago, Ill.—For about \$50,000, valves and hydrants, to J. E. Clow & Sons, Chicago, Ill., for about \$5,500, and lead and jute, to Montana Hardware Co., Lewiston, \$3,000.—O. F. Wasmansdorff, Consulting Engineer.
Cape May, N. J.—Erecting steel stack at water works, to Jos. H. Hanes.
Ventura City, N. J.—Duplicating present water and sewer plant, to Jos. L. Swelgart, \$9,940.38.
Westbury, L. I., N. Y.—Building water plant; Pipe laying, to J. C. Tierney, 1317 Park ave., Hoboken, N. J.; valves and boxes, to the Fairbanks Co., 416-22 Broome st., New York City; hydrants, to Eddy Valve Co., Waterford, N. Y.; pipe and specials, to Standard Cast Iron Pipe and Foundry Co., Bristol, Pa.; tank and tower, to S. D. Cole Mfg. Co., Newnan, Ga.; foundations, pump, station and setting pumps, to F. Powers, Westbury; pumps, to Platt Iron Works Co., 94 Liberty st., New York City; wells, to Thos. B. Harper Est., Jenkintown, Pa.; engines, will advertise for new bids.
Zanesville, O.—To J. E. Clow & Sons, 350 Franklin st., Chicago, Ill., for furnishing water pipe and special castings, to the Water Department; cost about \$5,000.
Checotah, Okla.—Complete installation of water works pump station, 7,600 ft. of 8-in. iron pipe, two double-acting triplex pumps, pole and wire line, etc., to C. R. Nichols, City, about \$13,160.
Akron, Pa.—Building water plant, to O. E. Christ, Ephrate, bids opened April 4; borough, however, will buy engine and pumping machinery and have same placed.
Reading, Pa.—Furnishing water gates, to the Darling Pump & Manufacturing Co., of \$516 each; fire hydrants, to Florence Iron Works, Florence, N. J., \$25.25 each.
Nashville, Tenn.—To J. H. Fall & Co., supply of castings for water works department, \$49 per ton.
Prescott, Wis.—Construction of a gravity water system, to Des Moines Bridge and Iron Co., Des Moines, Ia., \$19,419; other bidders: L. W. Schrueth, Fargo, N. D., \$20,700; Pastoret-Lawrence Co., Duluth, Minn., \$21,770; Fraser & Danforth, Rochester, Minn., \$22,900; W. D. Lovell, Minneapolis, Minn., \$19,700; J. P. Nolan, South St. Paul, Minn., \$23,335; J. G. Robertson, St. Paul, Minn., \$21,933.
Souris, Man., Can.—To M. S. Holmes, Portage la Prairie, Man., for laying water mains, \$39,000; to Kitchen Bros., Souris, for power house, \$3,200.
Toronto, Ont., Can.—To the Canada Foundry Co. for 20-in. c.-i. water piping, \$39.95 per 12-ft. length.
Vancouver, B. C., Can.—To Evans, Coleman & Evans, for eighty tons of pig lead at \$3.70 per 100 lb.; to same, for supplying steel pipe for water mains, \$43,217.85; to Robertson & Godson, for supplying valves, \$5,062.65; to Crane & Co., for supply of eighty Ludlow hydrants, at total price of \$2,333.67.

CONTRACTS AWARDED

LIGHTING AND POWER

Kingsburg, Cal.—To Braum, Williams & Russell, of Redondo Beach, for construction of a municipal water works from plans of Olmstead & Gilgelen, Wright & Callender Bldg., Los Angeles, \$25,000.
Sulsun, Cal.—To W. B. Connelly, for the work of raising dam of storage reservoir of municipal water system eight feet, which will increase capacity of the reservoir about twelve million gallons, \$1,940.
Terra Bella, Cal.—To Western Eng. & Water Supply Co., Oakland, for water and sewer system, \$6,034.
Jacksonville, Fla.—To the Reinforced Concrete Culvert Pipe Co., city, to furnish all the reinforced concrete pipe for Hollowman st. and Highway ave. storm sewers—F. W. Long & Co., Jacksonville, General Contractors; R. N. Ellis, City Superintendent.
Wheaton, Ill.—Water works improvements from plans of Jos. B. Rider, 112 N. La Salle st., Chicago; 60-hp gas engine and gas producer, to National Meter Co. of Chicago and New York, N. Y.; 2 centrifugal pumps, to American Well Works, Aurora; 100,000-gal. concrete reservoir, to Eugene Stark, of Wheaton, and excavation work, to J. C. Wheaton, Wheaton.
Herington, Kan.—To J. W. Kelso for increasing water supply, about \$8,000.
Boston, Mass.—Relaying water pipe in Clayton, Park and Hancock sts., Dorchester, to Michael Desesto, \$1,456.
Easthampton, Mass.—Furnishing pipe, to R. D. Wood & Co., Philadelphia, Pa., \$22.12 per ton; about 4½ miles of 8 and 6-in. pipe will be required for the extensions in East and Main sts. and to the Town Farm.
Detroit, Mich.—Furnishing 300 tons special water works castings, to American Car & Fdry. Co., \$2.15 per cwt.
Lewiston, Mont.—Furnishing approximately 50,000 ft. of c.-i. pipe of 120-lb. pressure; also fire hydrants, valves, lead, jute and other materials; c.-i. pipe and specials, to T. S. C. I. Pipe & Fdry. Co.,

Lodi, Cal.—Western States Gas and Electric Co. has purchased site on Cherokee lane for new substation and transformer house for distribution of power in this part of the county.
Willow, Cal.—Peoples Power Co. has been formed for manufacture and distribution of gas.—C. R. Wickes, A. S. Lindstrom, A. H. Quatman, J. W. Smith and E. T. Stern, Directors.
Fairburn, Ga.—City has issued \$10,000 of bonds for construction of electric light plant.
Richmond, Ind.—About \$6,000 will be spent for new stokers at municipal light plant within short time.
Manilla, Ia.—Citizens will vote April 14 on granting of franchise for installation of electric light plant.
Webster City, Ia.—Bids were received for furnishing equipment and material for improvements to municipal electric light and water works system.
Greensburg, Kan.—Citizens have voted \$15,000 bonds for municipal electric light plant.
Kansas City, Kan.—City will begin at once the construction of municipal lighting plant; issue of \$350,000 bonds has been authorized.
Horton, Kan.—Town has voted \$55,000 bonds to purchase light and water plant.
Escanaba, Mich.—Citizens have voted \$30,000 bonds for construction of municipal electric light plant.
Proctor, Minn.—Proctor Water and Light Co. has been granted franchise to install water works plant.
Tower, Minn.—Citizens have voted \$16,000 bonds for construction of water plant at Pike River Falls.
Bolton, Miss.—Power house, containing all the electric light plant and water works machinery, has been destroyed by fire.
Hastings, Neb.—Citizens have voted \$120,000 bonds for municipal lighting plant.

Burlington, N. J.—Citizens will vote April 18 on installation of electric light plant.

Andrews, N. C.—City is considering \$20,000 bond issue for electric lights, water works and street improvements.

Faith, N. D.—Faith Light and Power Co. has been granted franchise to install plant.

Glen Ellen, N. D.—Installation of electric light plant is being considered.

Dayton, O.—Bids have been rejected for lighting boulevard system.

Boswell, Okla.—Citizens have voted \$35,000 bonds for the installation of electric light plant and water works.

Springfield, Ore.—Council has granted franchise to Oregon Power Co.; reducing plant will be established; 4-in. main will be laid to the Eugene gas plant, distance of four miles.

Denver, Pa.—Council has passed ordinance giving D. S. Martin the right to operate electric system.

Royersford, Pa.—Council is considering feasibility of a municipal electric plant.

Temple, Tex.—I. A. Walker, Dallas, has made application to Council for franchise for installation here of a gas plant and distributing system.

Temple, Tex.—Col. P. L. Downs has about completed arrangements for installation of \$100,000 gas plant.

Wichita Falls, Tex.—M. A. Marcus and T. E. Dobson have been granted franchise by Council to install electric light plant; they will organize company.

Clarendon, Va.—Arlington Electric Co. has been chartered to furnish electricity to Ballston, Falls Church and Clarendon.—L. L. Northrop, Secretary.

Chehalls, Wash.—By passing franchise granting Twin City Light & Traction Company lease to operate electric lighting plant in this city for next 50 years, Council has secured building at once of \$75,000 power house.

Kelso, Wash.—Council has granted light and water franchises to Washington-Oregon Corporation.

Brooklyn, Wis.—Citizens will vote on bonds to install electric light and power plant.

Eau Claire, Wis.—Articles of incorporation have been filed by Minnesota-Wisconsin Power Co., capital stock \$100,000, organized to sell light and power from water plant at Eau Claire to towns and villages along river north of Winona.

Somerset, Wis.—Plant of St. Croix Power Co. at Apple River Falls has been destroyed by fire and will be rebuilt at once; St. Paul Gas & Light Co., owner.

Hamilton, Ont., Can.—Board of Control has selected E. T. Sifton, of London, Ont., to prepare plans and estimates for the installation of a municipal electric light plant and street lighting system.

CONTRACTS AWARDED

Escondido, Cal.—To Escondido Utilities Co. for lighting streets of city for a term of five years; contract calls for the installation of 50 lamps.

Jacksonville, Fla.—Furnishing 30-ton electric crane to Niles-Bement-Pond Co., Philadelphia, \$4,960; four new boilers, rebuilding of four boilers and removal of old ones to Babcock & Wilcox Company, New York City, \$39,384; three condensers for service equipment, complete, and replacing the auxiliaries of two other equipments to C. H. Wheeler Manufacturing Company, Philadelphia, \$40,400; one feed water heater to Warren Webster & Co., Camden, N. J., \$1,850, two boiler feed pumps, four duplex service pumps and two duplex piston oil pumps and necessary solid brass plungers to Warren Steam Pump Company, Warren, Mass., \$4,578; two 1,500-kilowatt turbo-generators and two 100-kilowatt turbo exciters to General Electric Company, Schenectady, \$54,650.

Auburn, N. Y.—Lighting city for ten years, to Auburn Light, Heat & Power Co.; about 35 ornamental lamps, \$91.75.

Darby, Pa.—Councils have made contract with Delaware County Electric Co. to light borough for a period of five years; arc lights of approximately 2,000-candle power are to be used on Main st.

Scranton, Pa.—By the Scranton Electric Company for laying steam mains on Washington Ave.; Gaynor Contracting Company, digging trenches; pipe contract to the American District Steam Company, Lockport, N. Y.

Sharon, Pa.—Having in contemplation erection of a municipal lighting plant, Council has signed contract with the Shenandoah Valley Electric Light Co. for only one year at \$72 per lamp.

Sherbrooke, Que., Can.—Erecting municipal lighting plant, to Canadian Westinghouse Co., \$40,000.

FIRE EQUIPMENT

Birmingham, Ala.—Board of Fire Underwriters has recommended that plain hose wagon now in reserve be equipped with 1,200 ft. of 3-in. hose; establishment of flying squadrons at two stations, each to be provided with auto combination hose wagon; also minor equipment.

Montgomery, Ala.—Bids have been rejected for house in South Montgomery; city will let contract for work.

Lodi, Cal.—Trustees have instructed Fire Chief H. E. Welch to purchase two hose wagons and harness.

Los Angeles, Cal.—Fire commission has asked appropriation to purchase six new ladder trucks, six auto pumping engines and six chassis for hose wagons, also 150 new fire alarm boxes to cost \$12,000, 150 police boxes \$12,000, central office equipment \$22,500, extra lead covered cables \$33,315, extra wire \$16,690, and red lights for police department \$5,000.

Stockton, Cal.—Fire Department has asked appropriation for purchase of several auto engines.

Hartford, Conn.—Citizens have voted \$65,000 appropriation for erection of engine house for No. 3 and erection of water tower on Market st.

Washington, D. C.—American consul in Canada states that one of town councils in his district has adopted resolution authorizing purchase of outfit for hook and ladder company and of 500 ft. of hose. Address 6485, Bureau of Manufactures.

Statesboro, Ga.—City will erect fire department building with stable in rear.

Waycross, Ga.—Council will ask for bids for furnishing auto combination hose and chemical wagon.

Moline, Ill.—Council has rejected all bids for purchase of auto fire truck.

Odebolt, Ia.—City has decided to erect fire station.

Waterloo, Ia.—Fire Chief A. A. Dunham has recommended need of motor apparatus and purchase of fire helmets.

Middleboro, Ky.—City will erect \$75,000 combined fire department, jail and city hall building.

New Braintree, Mass.—Town will soon purchase some fire appliances.

Palmer, Mass.—Town will enlarge station for new auto truck.

Springfield, Mo.—Fire Chief Samuel Hunter has recommended purchase of four pieces of auto apparatus.

St. Louis, Mo.—City will erect fire house at Clayton and Central aves. automobile engine will be installed.

Snyder, Neb.—Fire company has been organized.—H. G. Meyer, President.

Red Bank, N. J.—Council is considering erection of brick fire house for Relief Hose Co. on Pearl st.

Succasunna, N. J.—Purchase of chemical engine is being considered.—E. C. Harvey can be addressed.

Niagara Falls, N. Y.—Board of Public Works has approved of proposition of Fire Commissioners to erect two new fire halls and purchase new apparatus at estimated cost of \$42,500.

Syracuse, N. Y.—Board of Contract and Supply has decided to ask for furnishing 85-ft. extension ladder and exercising wagon for Fire Department.

Cincinnati, O.—Architect Harry Hake will prepare plans and supervise erection of \$22,000 engine house at Eastern Ave. for Company No. 11.

Carbondale, Pa.—Mayor A. L. Sahm has recommended need of chemical and ladder service in fire department.

Lansdale, Pa.—Purchase of \$2,000 steam fire engine is being considered.—John F. Lane is interested.

Nesquehoning, Pa.—Town will soon have \$5,000 hose house.

Norristown, Pa.—Montgomery Fire Co. has decided to purchase auto fire apparatus.

Sellersville, Pa.—Council is considering petition of citizens for suitable fire apparatus.

Williamsport, Pa.—Fire Chief Frank E. Striker has again recommended need of new apparatus.

Baltic, S. D.—City has decided to erect fire station and city hall.

Fairmont, W. Va.—Fire Chief Reed has recommended purchase of fire engine and erection of fire station in Fourth Ward.

Wheeling, W. Va.—Residents of Mozart Hill are urging installation of chemical engine.

CONTRACTS AWARDED

Rochester, N. Y.—Furnishing 10,000 ft. of cable for fire alarm telegraph system, to Standard Underground Cable Co., New York, \$1,350.

Georgetown, S. C.—Construction of a fire engine house, to Weston & Brooker, Columbia, \$9,021.

Nashville, Tenn.—By Board of Public

Works, to the Gamewell Fire Alarm Co., New York, eight fire alarm boxes \$1,000; to Seagraves Co., one hose wagon \$750.

Dallas, Tex.—Furnishing 2,000 ft. of rubber hose, to Eureka Fire Hose Co., New York City.

Ashand, Va.—Council has decided to purchase Howe gasoline fire engine manufactured by Howe Engine Co., Indianapolis, Ind., \$1,750.

BRIDGES

Oakland, Cal.—City Engineer Furness has estimated cost of placing culvert across Thirtieth Ave. and at Thirty-fifth Ave. at \$7,100; also recommended erection of culvert to carry Sausal Creek at Fruitvale Ave. from Central Pacific tract to Tidal Canal, \$60,000; culvert in Fortieth Ave., \$12,000, and culvert across Fleiter Ave., \$500.

Pasadena, Cal.—Plans for proposed W. Colorado st. bridge, containing patent inventions of W. M. Thomas and design under Thomas system by Thomas & V. Engineers, have been received by Mayor Early.

Brooksville, Fla.—Town will vote April 25 on \$2,000 of bonds for bridge construction.—W. A. Thaxton, Town Clerk.

Tampa, Fla.—Board of Public Works considering erection of permanent bridge over Hillsborough River.

Brownlee, Ida.—Appropriation of \$100,000 is available for construction of Snake River bridge.

Chicago, Ill.—Citizens have authorized \$6,430,000 bond issue for bridges and parks.

Rising Sun, Ind.—County Commission have adopted plans for a bridge across Island branch.

Topeka, Kan.—County Commissioners planning to erect \$7,000 bridge at Valey and \$30,000 bridge at Grantville.

Covington, Ky.—Bids will be asked for rebuilding Robbins st. bridge.

Littleton, Me.—Town has appropriated \$800 for new bridge.—B. R. Tingley, Town Clerk.

Whitinsville, Mass.—Town has appropriated \$5,500 for small bridges and roads.

Lansing, Mich.—Citizens have voted to build modern \$85,000 bridge at Johnson.

Fulton, N. Y.—Plans have been completed for erection of proposed \$170,000 bridge. Address City Engineer Hackett.

Lorain, O.—County Commissioners considering construction of high level bridge at 31st st.; estimated cost \$40,000.

Springfield, Tenn.—County Court has appropriated \$4,250 for building bridge Beutne's Ford.

Logan, Utah.—County will vote May on \$150,000 bonds for building bridges on roads.

Richmond, Va.—Council Committee Streets has recommended adoption of sign B, submitted by I. J. Smith & Co. for erection of reinforced concrete a bridge over James River, to replace May bridge.

Hudson, Wis.—Citizens have voted \$200,000 bonds to build wagon bridge across Lake St. Croix.

Marquette, Wis.—Citizens have voted \$50,000 bonds to build bridge over Menominee River.

CONTRACTS AWARDED

Birmingham, Ala.—Building bridge over Elyton branch to A. C. Brooks, \$1,372.50.

Champaign, Ill.—Constructing 700 ft. bridge, to J. M. Breese, Mattoon, \$14,000.

Waterloo, Ia.—Erecting 2-span concrete bridge, to Miller & Rey, approximately \$11,000.

Pomfret, N. Y.—Erecting concrete bridge at Laona, to Holleran Bros., Elmira, \$2,700.

Reading, Pa.—Construction of three concrete bridges in the county: Mohnton Bridge No. 1, crossing the Wyomissing Creek in Mohnton, to Carl R. Camp, Moore, \$5,461; Bordner's Bridge No. 2, located in Jefferson and North Heidelberg Townships and crossing the Tulpehocken to Willauer & Co., of Pottstown, \$7,300.

Bordner's Bridge No. 2, located in Berks and Tulpehocken Townships and crossing the Swatara, to Nelson, Meredyth & Co. of Chambersburg, \$6,560; other bidders were as follows: Mohnton Bridge No. 1, Nelson, Meredyth & Co., Chambersburg, \$5,475; L. H. Focht & Co., Birdsboro, \$8,532.50; Ferro-Concrete Co., Harrisburg, \$6,053; Daniel Wanner, Reading, \$5,800; Willauer & Co., Pottstown, \$5,521.68; Bordner's Bridge No. 1, Nelson, Meredyth & Co., \$8,617; Ferro-Concrete Co., \$7,457; Bordner's Bridge No. 1, Ferro-Concrete Co., \$7,269; Willauer & Co., \$6,897.

Richmond, Va.—Construction of 12 modern bridges in Southampton County, to about \$21,000, to Virginia Bridge and Iron Co., Roanoke.

No. 16

INTERIOR OF WILMINGTON SAND FILTERS. SAND WASHING MACHINE AT RIGHT

WATER PURIFICATION AT WILMINGTON

Report of Work Done by New Filtration Plant—Sponge Filters for Preliminary Clarification—Defective Rate Controlling Device Lowers Efficiency—Low Cost of Operation—Sand Cleaning Machine

THE water purification plant of the Wilmington, Del., water department, then nearing completion, was described in our issue of November 10, 1909. It has now been in service for a number of months, and some details of its operation are given by the bacteriologist, A. Robin, in the 1910 report of the water commissioners, an abstract of which report is given below. As described in our article above referred to, the plant consists of a sponge filter on the bank of Brandywine Creek, the effluent from which is pumped to a reservoir 120 feet higher, adjacent to which is a slow sand filter resting upon the roof of a pure water reservoir.

THE PRELIMINARY FILTER

Preliminary filtration or prefiltration has become an established practice in the construction of slow sand filters. The object of prefiltration is to remove from the raw water as much of the suspended matter as can be strained out rapidly and economically. In this respect prefiltration takes the place of sedimentation, and, comparing the relative values of the two methods, first cost as well as the cost of maintenance should be taken into consideration. It is now fairly well established that prefiltration is to be preferred to sedimentation, not alone on the ground of economy, but the greater flexibility of the preliminary filter. The question of the best filtering medium is still open for final settlement. Coarse sand is now generally employed, but to this there is the objection that the void in the sand is only about 35 per cent, and therefore the beds clog up rapidly, requiring frequent cleansing. When this is to be done with water that has been pumped, the cost of washing is materially increased. Sponge would seem to be an ideal medium were it not for the difficulty in cleaning the sponges when clogged up. The air-wash employed in our

preliminary filter has been very effective in delaying the complete clogging of the sponges, but not in preventing it altogether. The time is fast approaching when it will become necessary to remove the sponges from the beds and clean them thoroughly. Whether this will offset the low cost of maintenance of the sponge filter as compared with the sand filter remains to be seen.

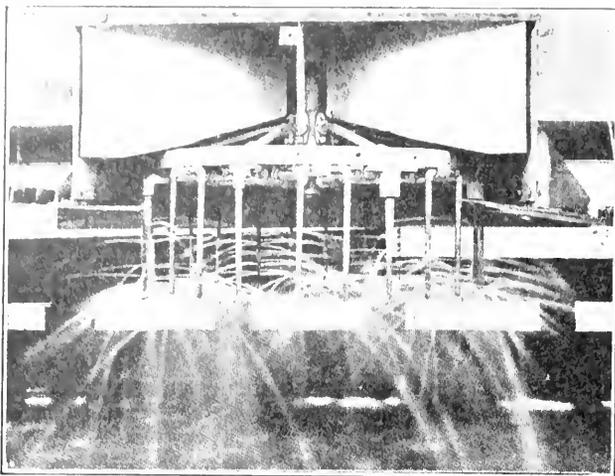

The defect in the rate-controlling devices of our preliminary filters, referred to in my last report, has materially reduced the efficiency of the plant. As operated at the present time, there is absolutely no way of determining the time when any given bed should be cleaned. We do not know whether any given bed is cleaned too often or not often enough, and the entire operation is in the nature of guesswork. Under the circumstances I feel that our figures as to efficiency and relative cost of maintenance are incorrect and should not be used as a basis of comparison.

It is my opinion that this defect should be remedied. As there is no practical advantage to be gained by the removal of bacteria by prefiltration, the study of the bacterial efficiency of the preliminary filter is a waste of time and culture medium, and I would recommend that this routine study be discontinued.

To sum up my recommendations with regard to the preliminary filter:

- (1) The sponges should be removed, thoroughly washed and replaced.
- (2) An efficient rate-controlling device should be installed together with a loss-of-head indicator for each bed.
- (3) Routine determination of turbidity before and after filtration.

According to the daily analyses made, the turbidity (silica scale) of the raw water varied from 10 to 1200, the former

WASHING MACHINE, SHOWING TEETH AND WATER JETS

being the turbidity about 50 per cent of the time. The turbidity of the prefilter effluent varied from 3 to 300. That of the sand filter effluent was ascertained only a part of the time, but was always zero; the sedimentation in the reservoir before final filtration reducing the turbidity to between 5 and 70. The mean turbidity of the raw water during the year was 38; of the prefilter effluent, 17; and the average efficiency in reducing turbidity was 56 per cent, the maximum efficiency for any day being 70 per cent. In removing bacteria the prefilter was very erratic, some days showing an efficiency of more than 90 per cent, and on others an increase in numbers of 75 per cent. The sand filters showed a bacterial efficiency varying between 74.4 and 99.6 per cent, the average being 94.9.

Chief Engineer John A. Kienle reported: "The quantity of water which passed through the filter during the period of its operation amounted to approximately 1,700 million gallons, and the total cost of operation amounted to \$2,324.20 exclusive of laboratory charges, or an equivalent of \$1.36 $\frac{3}{4}$ per million gallons. This unit cost is approximately 40 per cent less than for sand filter plants of similar capacities located elsewhere, and, neglecting the saving in first cost of constructing the plant, this marked economy in operation is sufficient warrant for the radical step taken by this department in adopting the latest improvement in cleansing the filter sand in place on the beds by machine methods."

In our issue of January 4, 1911, we described the Blaisdell

sand cleaning machine, and we give herewith two illustrations of it. These cuts show the inverted box and the carriage from which it is suspended, also the perforated teeth. The filter is cleaned without withdrawing the water from the box being lowered to the sand and the teeth forced below the surface of the sand for any distance desired. Water forced into the hollow teeth and leaves them through perforations, the teeth meantime revolving around the center of the box as an axis and the box as a whole moving over the surface. A centrifugal pump connected with the top of this inverted box sucks out the water which is discharged through the teeth.

REMOVAL OF DOMESTIC ASHES

In response to an inquiry Frederick T. Elwood, Commissioner of Public Works of Rochester, N. Y., described as follows the method employed in that city for removing ashes:

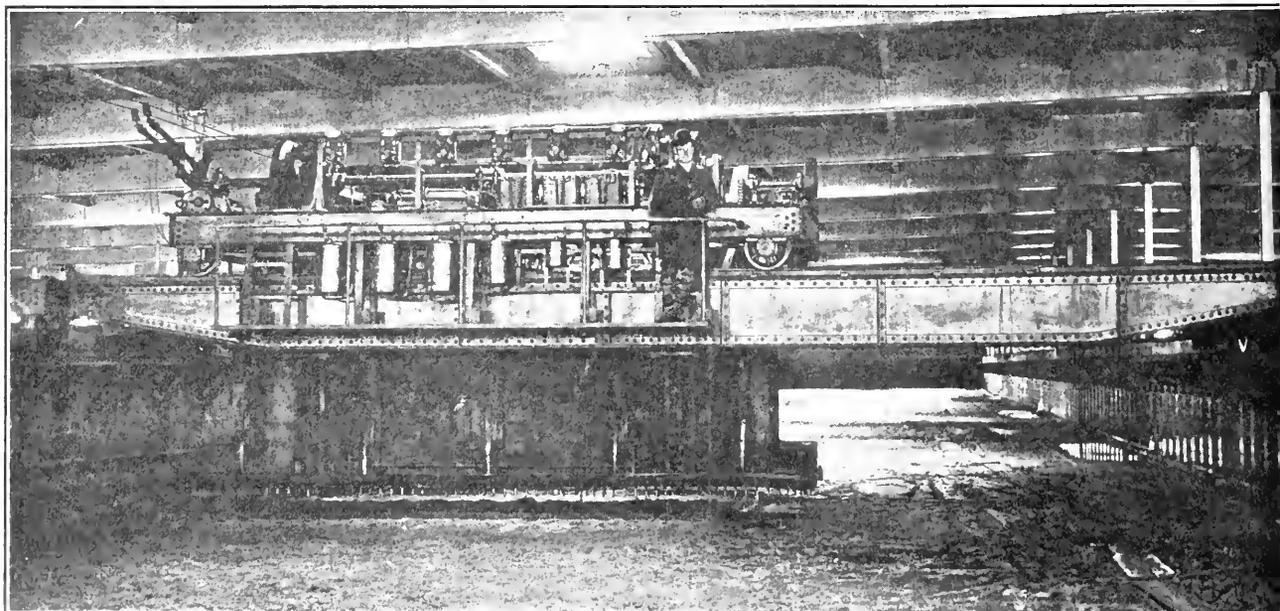

The city is divided into nine districts. Three of these (the more congested part of the city) have two ash gangs each while each of the other six has one ash gang. Each gang contains four truckers, four loaders, two returners and a foreman.

The truckers enter the premises and take the ashes to the curb, beginning work shortly in advance of the teams; they are followed by the teams and loaders, who, after emptying the receptacles, replace them on the curb; these, in turn, are closely followed by the returners, who replace the receptacles in their proper places on the premises. Our men are not allowed to enter any buildings; receptacles are placed in rear lot by the occupant of the premises.

The gang works along one side of a street and back on the other side, and at no time are the truckers and loaders widely separated. The teams are always closely followed by the returners. All receptacles brought out by the truckers must be dumped and returned before the gang stops work for the night.

In each district the work is commenced at the same point every Monday morning, and in most cases the route is covered by Friday noon. The average haul to the dump is about 1.5 miles, and each gang keeps from five to seven teams moving.

The nuisance of having ash and garbage cans standing on the sidewalk for hours is only a little less than that caused by the emptying of the former into the wagons on windy days and the carrying of garbage through the streets in open wagons. Many cities and towns remove the cans from the back yard of residences, but we believe that the three gangs acting in succession, as described above, is unusual. It would seem, though there might be an economy in this, as the cart is kept in almost continual motion instead of stopping at each house while the driver and helper get and return the can.

FILTER SAND WASHING MACHINE

STREET CLEANING MACHINE

In sweeping the paved streets of Augusta, Ga., the ordinary sweeping machines are used, which work the sweepings toward the side of the street, the last machine of the series leaving the sweepings piled in a row in the gutter. The previous method, and one followed in most cities, was to have men with shovels take these into piles, after which a cart which followed the sweeping machines would remove the sweepings, which were shoveled into it by an attendant. Recently the city has adopted a pick-up machine which takes the place of this cart and the six men employed to shovel the sweepings into piles. This machine runs along the gutter and picks up the sweepings directly by the regular sweepers, collecting them in a receptacle which forms a part of the machine. When the receptacle is full the material is dropped in a pile and the machine proceeds to pick up the sweepings ahead of this, which are again deposited, thus leaving the sweepings deposited in a few large piles instead of a number of small ones as formerly. The cart is loaded as before, but it now has to stop only two or three times to obtain a full load, where heretofore it stopped approximately every fifty feet. City engineer and commissioner of public works Nisbett Wingfield, to whom we are indebted for this information, states that this effects a saving of the labor of the men and a considerable part of the time of the cart and driver, and that this saving more than offsets the cost of the pick-up machine.

OKLAHOMA CITY'S FIRE SYSTEM

OKLAHOMA CITY is now provided with a system of independent water mains for the fire protection of the central portion of the retail and wholesale business district of the city. This system is fed through a 20-inch cast iron main direct from the pumping station 8,500 feet away. The lateral mains laid through the district are 18 inches and 12 inches in diameter. At each street intersection there is a Ludlow hydrant of the slide valve type with an 8-inch valve opening and equipped with four independently controlled hose nozzles and one 5½-inch steamer nozzle. All gates larger than 12 inches are set in manholes so as to be readily accessible for operation or repairs. All the pipes are cast iron of standard weight, class C bell and spigot pattern. There are 11,500 feet of 20-inch pipe, 2,100 feet of 18-inch, 11,050 ft. of 12-inch, all laid at sufficient depth to pass under all other water lines, gas lines and conduits. No services of any kind are taken from this system. The inde-

pendent system and the domestic system are interconnected, but check valves are placed in the connections, so that while the domestic pressure of 65 pounds is always effective in the independent system, the fire pressure of 115 pounds which is created in the independent system on the occurrence of a fire is not transmitted to the domestic system. This pressure of 115 pounds is the maximum which it is expected to carry in the independent system. There are also by-pass connections provided with valves, and should any of the domestic line mains break or be otherwise put out of service the domestic system could be fed through these connections by opening the valves.

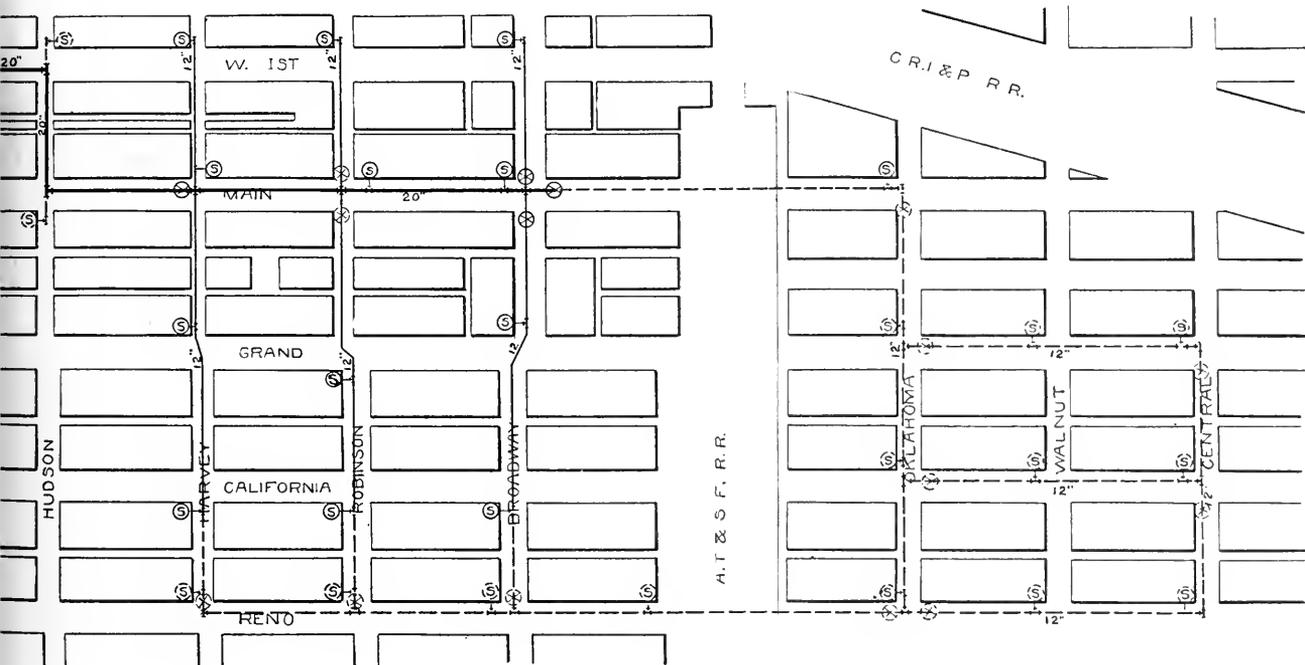

Through a special arrangement of gates at the pumping station any of the four high-duty pumps may be utilized for pumping directly into the independent system. These four pumps comprise two direct-acting, triple-expansion Worthington pumps of 3,000,000 gallons capacity each, one triple-expansion Prescott of 6,000,000 gallons capacity, and one cross-compound, crank and fly-wheel pump of 10,000,000 gallon capacity made by the Platt Iron Works.

As 115 pounds is the maximum pressure which the independent line is supposed to carry it is apparent that this could not correctly be called a high-pressure system. The professed object of the system, however, is to furnish an independent fire system through which may be delivered large quantities of water with good pressure at the hydrant, thus eliminating the friction loss and diversion of a portion of the supply which would occur in the domestic distribution system.

For the above information and for the map which accompanies this article we are indebted to Mr. Vincent G. Shinkle, engineer and superintendent of the Water Department.

THE COST OF DRINKING FOUNTAINS

The city of Cambridge in 1910 maintained 29 drinking fountains, 6 of which were kept provided with ice during the summer months so as to furnish cold water. The cost of supplying these ice water fountains with ice for 6 years had varied from \$89.49 per fountain per year to \$185.68; the costs varying both with the cost of ice in the several years and also with the extent of use made of the several fountains. In 1906 ice cost from 25 to 40 cents per 100 pounds, but in the other years the price was from 12½ to 15 cents per 100 pounds. The average cost per day per fountain, averaging the six fountains, was \$1.20, 94 cents, \$1.57, \$1.09, \$1.04 and \$1.15 for each of the 6 years respectively.

MAP OF INDEPENDENT HIGH-PRESSURE FIRE SYSTEM, OKLAHOMA CITY, OKLA.

BRICK PAVING SPECIFICATIONS

Standard of the Association for Standardizing Paving Specifications—Preparing Sand Cushion—Expansion Joints—Grout, Pitch and Asphalt Fillers

The standard specifications for brick paving adopted by the Association for Standardizing Paving Specifications this year are much more complete than those of last year, especially in the matter of testing. This was made possible by the final agreement of the N. P. B. M. Association on a standard rattler. The committee unanimously dropped the absorption test. The specifications for grout filler were changed in their wording, and new ones adopted for pitch and asphalt fillers. The specifications are given below.

"By permission of the association these extracts are reprinted from the copyrighted proceedings of the Association for Standardizing Paving Specifications. John B. Hittell, Secretary-Treasurer, 5017 Winthrop avenue, Chicago."

Character of Brick

Section 1. All brick must be strictly No. 1 pavers, of the size commercially known as "vitrified block," the widths of which must not vary more than one-eighth of an inch. They must be thoroughly annealed, tough and durable, regular in size, shape, and evenly burned.

When broken the brick shall show a dense, stone-like body, uniform in color inside, free from lime, air pockets, cracks or marked laminations. Kiln marks must not exceed three-sixteenths of an inch, one edge, at least, to show but slight kiln marks. All bricks so distorted in burning as to lay unevenly in the pavement shall be rejected.

The standard size of brick shall be three and one-half ($3\frac{1}{2}$) inches in width, four (4) inches in depth, and eight and one-half ($8\frac{1}{2}$) inches in length. They shall not vary to exceed one-eighth ($\frac{1}{8}$) of an inch in width and depth, and not more than one-half ($\frac{1}{2}$) inch in length. If the edges of the brick are rounded the radius should not exceed one-eighth ($\frac{1}{8}$) of an inch. Only brick with raised lugs on one side not to exceed one-fourth ($\frac{1}{4}$) inch in height shall be used.

Inspection

Section 2. All brick shall be subject to thorough inspection before and after laying and rolling, and all rejected material shall be immediately removed from the street.

Delivery of Brick

Section 3. The brick shall be hauled, carefully unloaded by hand, and neatly piled on the walks or outside of the curbs before the grading is finished, and in laying shall be carried from there to the pavement.

Rattler Test

Section 4. The brick shall not lose more than per cent of their weight after being submitted to the following tests:

Samples of brick of uniform shape and appearance shall be taken from each car (estimated at 10,000 brick). Brick having a defect that would cull them shall not be used. Three grades of samples shall be tested, one of the softest, one of the medium, and one of the hardest burned. If all of the tests overrun the above percentage of loss the car shall be rejected. If one or two of the tests overrun another test of said grade or grades shall be made. Should only one of these tests overrun the specified percentage of loss the contractor may cull said grade, provided they do not exceed ten (10) per cent of the amount of brick in the car, and deliver the balance on the improvement. Otherwise the whole car will be rejected.

In order to prevent the continued shipments of inferior brick only two cars of two separate shipments of any make of brick will be tested. Should they fail to meet the requirements stated above said make of brick will be rejected for this improvement. *(Inasmuch as your committee has made but a limited number of tests with the proposed rattler and charge it was decided at this time to not recommend any allowable percentage of loss due to abrasion, but from the best obtainable information the committee suggests that in the absence of exhaustive tests an increase of three (3) points be allowed by the cities over their previous requirements until further data are procured.)*

Number and Condition of Brick

Section 5. Ten paving brick shall constitute the number to be used in a single test. The brick shall be thoroughly dried for at least three (3) hours, in a temperature of one hundred (100) degrees Fahr. before testing.

Tests Before Unloading

Section 6. The contractor shall notify the proper city official of the location and car number of each carload of brick received. Samples from such car shall be taken and tested by

the city, and no brick shall be delivered on or adjacent to improvement on which the brick are to be used until in receipt of a written statement from the engineer or his authorized representative, that the samples have passed the required Decision relative to each carload will be made within two (2) hours of notice. Permission to deliver brick on line of work shall not be considered a final acceptance in respect.

Following this in the standard specifications is a description of the standard rattler and method of using the same which was described on pages 352 and 353 of our issue of March 1911. The specifications then continue as follows:

Foundation

Section 12. All brick to be laid on a — inch concrete with sand cushion.

Sand Cushion

Section 13. Over the foundation shall be spread to a uniform depth of one and one-half ($1\frac{1}{2}$) inches (after rolling) a cushion of clean, sharp sand, free from loam or foreign matter. The sand must pass a one-quarter ($\frac{1}{4}$) inch screen. The cushion shall be carefully shaped to a true cross-section of roadway by means of a template having a steel-faced edge covering at least one-half ($\frac{1}{2}$) the width of the brick work and so fitted with rollers as to be easily drawn on the curb guide timbers or rail.

Template

Section 14. See plan of template.

Guide Timbers

Section 15. Guide timbers shall be one and one-half (1½) inches by four (4) inches by sixteen (16) feet, dressed on sides, laid to a true surface in the center of the street and to the curb, if curb cannot be used.

Shaping Cushion

Section 16. Before shaping the cushion a one-half ($\frac{1}{2}$) inch strip shall be laid on the curb, and guide timbers or rail, the template drawn over the same, after which the one ($\frac{1}{2}$) inch strip shall be removed, the cushion slightly moistened and rolled over its entire surface with a hand roller. The roller shall be not less than thirty-six (36) inches in diameter, twenty-four (24) inches in width, and weighing not less than ten (10) pounds per inch in width, and having a handle two (2) feet in length. After rolling the template shall be drawn over the curb and guide timbers or rail, to complete the cushion. The cushion shall be prepared at least fifty (50) feet in advance of the brick laying.

How Laid

Section 17. The brick shall be laid in straight lines on the curb at right angles to the curb; at intersections they shall be laid as directed. Brick shall be laid with the lug sides in the same direction. Brick must be placed close together, breaking joints at least three (3) inches. At every fourth course the bricks shall be driven together to secure tight joints and straight courses, and all thick brick shall be removed.

When any section shall contain more than ten (10) per cent of culls the brick shall be taken up and the cushion adjusted. Brick shall be laid from curb to curb, or car track to curb.

No bats or broken brick shall be used except at curbs of the street car tracks. After the brick are laid the end joints are to be made close by use of a bar applied at the ends to the curb. Barring shall immediately follow the laying.

Joints shall be cut square with the top and sides of brick, and all joints must be kept clean and open to the bottom until finished as specified.

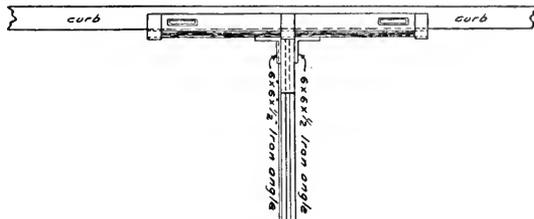

Street Car Tracks

Section 18. Along the street car tracks the brick must be laid within one-quarter ($\frac{1}{4}$) of an inch of the rail, and no brick rolled shall be one-quarter ($\frac{1}{4}$) inch below the top of the rail.

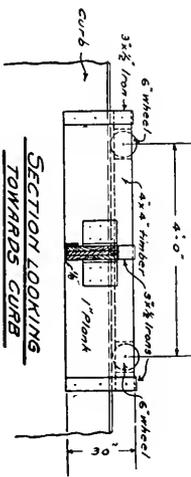

The space between the web of rail and the brick shall be filled with cement mortar, consisting of two (2) parts sand and one (1) part Portland cement. The mortar shall be in proper condition and the edge constructed to a straight line before the brick are laid.

Expansion Joints for Cement Grout Filler

Section 19. Expansion joints shall be placed parallel with and at each of the curb lines, and shall be one and one-half (1½) inches in width. The joints shall be made by placing wedge-shaped strips six (6) inches in width, and dressed two faces together on edge, parallel with the curb. The strips next to the curb shall be one (1) inch wide on top, beveled to a thickness of one-half ($\frac{1}{2}$) inch at the bottom, and the strips next to the brick shall be of the same dimension and placed in a reverse position. The brick shall be laid lightly against the strips. Soon after the pavement has been grouted and cement filler has set, and the pavement is in all other respects finished, the strips shall be removed, the joints thoroughly cleaned out, and immediately completely filled with a bituminous

PLAN SHOWING GUIDE TIMBERS USED AT CURB LINE

SECTION LOOKING TOWARDS CURB SHOWING GUIDE TIMBERS USED AT CURB LINE

TEMPLATE FOR SHAPING SAND CUSHION UNDER BRICK PAVEMENT

1910

PLAN OF TEMPLATE FOR SHAPING SAND CUSHION

tiller composed of a material which, when penetrated by a No. 2 needle under a weight of 200 grammes for one (1) minute at a temperature of 32 degrees Fahr., will not be less than 20, and when penetrated with a No. 2 needle under 50 grammes for five (5) seconds in a temperature of 115 degrees Fahr., will not have a penetration of over 100.

The section concerning rolling is the same as last year's specifications, but there has been added to it the following:

After final rolling the pavement shall be tested with a ten-foot straight edge, laid parallel with the curb, and any depression exceeding one-quarter of an inch must be taken out. If necessary, the pavement shall be again rolled.

In the old specifications at the end of the article on rolling the sentence beginning "expansion, etc.," is omitted. The balance of the specifications dealing with cement filler has been changed so considerably that it seems desirable to reprint the new form entire. This section and the rest of the specifications follow:

Portland Cement Grout Filler

Section 21. The filler shall be composed of one part each of fine, clean, sharp sand and Portland cement. All cement used for this work must stand the test as approved and adopted by the Organization of City Officials for Standardizing Paving Specifications, January 13, 1911.

The sand shall pass a No. 20 standard sieve. Sand shall be measured in a box having the same cubical contents as one sack of cement.

One sack of cement with an equal amount of sand shall be thoroughly mixed together dry in a box four (4) feet eight (8) inches long, thirty (30) inches wide, and fourteen (14) inches deep, resting on legs of different lengths, so that the mixture will rapidly flow to the lower corner of the box, the bottom of which shall be six (6) inches above the pavement. One box shall be used for each fourteen (14) feet in width of roadway, and at least two (2) boxes must be used in all cases.

After the cement and sand have been thoroughly mixed until the mass assumes a uniform color, enough clean water shall be added to make a liquid mixture of a consistency of thin cream. From the time the water is applied until the last drop is removed and floated into the joints of the pavement the mixture must be kept in constant motion. Before the grout is applied the brick shall be thoroughly wet by being gently sprayed.

The grout must be removed from the box with scoop shovels and applied to the brick in front of the sweepers, who shall rapidly sweep it lengthwise of the brick into the unfilled joints until the joints are filled to within not more than one (1) inch of the top of the brick. After the grout has had a chance to settle into the joint and before the initial set develops the balance of the joints shall be filled with a thicker grout, and, if necessary, refilled, until the joints remain full to the top.

After this application has had time to settle and before the initial set takes place the pavement shall be finished to a smooth surface, with a squeegee or wooden scraper, having a rubber edge, which shall be worked over the brick at an angle with the brick.

When completed and the cement has received its initial set the pavement shall be covered with a one-half ($\frac{1}{2}$) inch layer of sand, which shall be frequently sprinkled in warm weather. No travel shall be permitted on the pavement for a period of from seven (7) days after grouting, or longer, as the engineer may require on account of weather conditions.

Ample barricades and watchmen shall be provided by the contractor for the proper protection to the grouting.

(While your committee is in favor of a cement grout filler we believe that where conditions do not favor the use of the same for good and sufficient reasons, we recommend the adoption of bituminous filler under the following specifications.)

Coal Tar Paving Pitch Filler

Section 22. The joints or spaces between the paving blocks and between the paving blocks and the curb, railroad tracks, around manholes, etc., shall be filled with coal tar paving pitch, which shall comply with the following requirements:

Physical Properties

When in place in the pavement it shall be of such character that it will adhere firmly to the paving block and to the curb, and shall be sufficiently plastic to allow for the contraction and expansion in the pavement without developing cracks in the joints. It shall be proof against action by water and all acids or alkalis to which the pavement may be exposed.

Melting Point

It shall have a melting point varying not more than 5 degrees from 135 degrees Fahr., determined by the cube method (hereinafter described.)

Method of Use

The filler shall be heated and poured into the joints to the full depth thereof, at a temperature of not less than 300 degrees

Fahr., nor greater than 350 degrees Fahr. All joints shall be completely filled to the top. The top dressing of sand shall be spread over the pavement immediately after the filler is applied and while it is still soft. In cold weather the sand shall be heated so as to readily bond with the pitch. Extra care shall be used at the gutters and around catch basins, etc., to actually prevent the leakage of water into the subroadway. Free carbon shall not be less than 25 per cent nor more than 40 per cent; the specific gravity shall not be less than 1.20 nor more than 1.30 at 60 degrees Fahr.

Asphalt Filler

Section 23. The interstices of the brick shall be completely filled with an asphalt filler heated to a temperature of not less than 350 degrees Fahr., nor more than 450 degrees Fahr. The asphalt filler shall not contain pitch nor any part of coal tar. It shall contain at least ninety-two (92) per cent of bitumen soluble in carbon disulphide. It shall remain pliable at all temperatures to which it may be subjected as a street paving filler. It shall be absolutely proof against water and street liquids. It shall firmly adhere to the brick and be pliable rather than rigid. Care shall be exercised to completely fill all open spaces around street structures and the street shall not be used for traffic until the filler is completely set. A top dressing of sand shall be spread immediately after the filler is applied while it is still soft.

Test for Melting Point of Pitch and Asphalt Fillers

Section 24. A clean-shaped one-half ($\frac{1}{2}$) inch cube of pitch or asphalt to be formed in the mold and suspended in the beaker so that the bottom of the pitch or asphalt to be tested is one (1) inch above the bottom of the beaker. The pitch or asphalt is to remain for five (5) minutes in water at a temperature of 60 degrees Fahr. before heat is applied. The pitch or asphalt to be applied in such a manner that the temperature of the water is raised 9 degrees Fahr. each minute. The temperature recorded by the thermometer at the instant the pitch or asphalt touches the bottom of the beaker to be considered the melting point. The filler shall be such that it retains its consistency under extreme temperatures. For materials which show a narrow range of consistency at extreme temperatures a melting point should be used than in such materials which show a wide range of consistency.

The penetration shall conform to the following:

No. 2 needle, 5 sec., 100 grammes at 77 degrees Fahr., 25 or less.

No. 2 needle, 1 min., 200 grammes at 32 degrees Fahr., below 25.

No. 2 needle, 5 sec., 50 grammes at 115 degrees Fahr., below 110.

The melting point or consistency of the filler should be decided upon and specified for the particular locality in which the paving is to be done.

Maintenance

Section 25. The period of guaranty shall be five (5) years. During the period of guaranty, whenever the surface of a paved brick pavement becomes uneven, holding water one-fourth ($\frac{1}{4}$) of an inch or more in depth in a distance of four feet or less, or when the pavement has settled over trenches filled previous to the completion of the pavement, then the brick shall be taken up and relaid to proper crown and grade.

Any brick which may be found soft, unsound, broken, disintegrated shall be removed and properly replaced with sound material. All portions of the pavement which may become rough by reason of the chipping or breaking of the edges of the brick so as to produce joints exceeding one ($\frac{1}{2}$) inch at a point one-quarter ($\frac{1}{4}$) inch below the surface of the brick shall be replaced with new material. If in any continuous three hundred (300) lineal feet of the pavement it is found necessary to repair more than one-third ($\frac{1}{3}$) of the area, or if the cracks in the brick exceed the proportion of three (3) cracks to one foot of pavement, then all the brick in such area shall be taken up included in the three hundred (300) feet and the curb lines and be relaid with new sound brick.

The members of the committee which reported these specifications were E. H. Christ, chairman, member Board of Public Works, Grand Rapids, Mich.; D. M. Roberts, secretary, civil engineer, Terre Haute, Ind.; Henry Maetzel, chief engineer, Columbus, O.; John B. Hittell, chief engineer of street Board of Local Improvements, Chicago, Ill.; James H. Sullivan, deputy superintendent of streets, Boston, Mass.; E. A. King, superintendent, Department of Public Works, Little Rock, Ark.; Geo. L. Campen, assistant city engineer, Omaha, Neb.; I. Cellarius, city engineer, Dayton, O.; H. W. Klausmann, civil engineer, Indianapolis, Ind.; T. S. Oxholm, engineer in charge, Bureau of Engineering Construction, Borough of Richmond.

Massachusetts Institute of Technology

THE Massachusetts Institute of Technology has just completed a half century of existence and on April 10th celebrated the anniversary of the signing of the charter by the Governor of the State, the exercises being continued on April 11th by the presentation of papers by alumni of the school illustrating the part which it has played in the advancement of science. It speaks well for the interest which the general public takes in this institution, as well as for the enthusiasm of the alumni, that hundreds were excluded from the meetings through lack of capacity of the halls.

To municipal engineers and sanitarians this school has been and is of especial interest, since it has for some years conducted a regular course of instruction in municipal sanitation and operated a laboratory especially devoted to sewage disposal and its graduates have done the lion's share of what has been accomplished in this country in advancing the art and science of water and sewage purification and the application generally of engineering, biology and chemistry to solving the problems of preventing and removing unsanitary conditions in cities.

During the past twenty-five years it has graduated a large percentage of the city engineers, city planning experts, superin-

tendents of water works and other officials and expert advisers of those municipal departments which are engaged in controlling the forces and utilizing the materials of nature in the evolution of the modern city.

With the rapidly increasing importance of the scientific man in all branches of human endeavor, and by no means least in municipal undertakings, the demand for graduates of the Institute has increased to such an extent that it has outgrown its capacities, although used to their utmost, and the problem which the Institute is now endeavoring to solve and which it is believed will be solved within the next few months is finding a new location where can be constructed buildings and facilities more nearly adequate to its present demands and giving possibilities for future expansion.

Legislation Against Rapid Filtration

THERE was introduced in the Pennsylvania Legislature last month a bill which if it should pass would work the greatest injury to sixty-one municipalities of that state. This is entitled "An article to prohibit the use of alum and alum compounds in the filtration of water by any person or persons, corporation or municipality furnishing water to the public and providing a penalty for a violation thereof." The bill is extremely brief, being practically only a repetition of the title above quoted, with provision for a fine of \$100 for each day of violation of the act or imprisonment of 100 days. This would take effect on the first of January next.

This bill had already been placed upon the calendar before it was noticed by any who realized its importance. As soon as this happened, however, word was immediately sent to water companies and municipalities throughout the state which were operating rapid filtration plants, of which there are 61 in the state supplying about 150 million gallons of water per day, and 80 representatives from these companies and cities gathered at Harrisburg to protest against the bill. It is fortunate that possibly the best object lesson which the state representatives could have been shown in illustrating the objections to the bill was right at hand in the form of the Harrisburg filtration plant, which is one of the best in the country.

It is almost inconceivable that the Legislature would pass such a bill, as it would undoubtedly mean that a majority of the municipalities in Pennsylvania now supplied with filtered water would return to the use of crude water, finding or believing themselves financially unable to build slow sand filters between now and next January. There are certain objections to the use of alum in purification plants, but the great majority of sanitarians who have made a special study of water purification believe that rapid filtration with the use of alum possesses advantages which far outweigh the disadvantages; and for certain water, in fact, there appears to be no substitute for this method of filtration, the large amounts of fine suspended matters making the use of slow sand filters impracticable.

A Town as a Delinquent Consumer

THE water registrar of Clinton, Mass., in his report for the year 1910-1911 to the Water Commissioners of the municipal water works makes the following statement: "All water rates for the year, except \$160 for street sprinkling, have been collected. I was assured that this amount would be paid before the end of the fiscal year, but as the town refused the required appropriation the standpipes are shut off and will remain so until payment is made."

This statement seems to reveal a very unusual condition for several reasons. In the first place we doubt whether many municipal water plants can state that all water rates have been paid, except those (if any) owing from the city. It is certainly not to the credit of the town that it should be the only delinquent consumer. And, finally, we do not recall having ever heard of another case in which a city or town was treated so summarily and had its water shut off like any common consumer. If the plant is run on such thoroughly businesslike principles in all other respects, it should be a financial success and a profitable investment for the taxpayers.

COMPTROLLER W. M. A. PRENDERGAST, of New York City, will undoubtedly receive the thanks of the creditors of that city and will probably enable several of the departments to secure better prices if he should succeed in the attempt which he is now making to secure more prompt payments of the undisputed bills received by the city. On April 3 the comptroller wrote to Mayor Gaynor urging him to demand from the commissioners of the several departments that they send vouchers for all purchases within twenty days, in which case he practically guaranteed that the Department of Finance will audit the bills for payment within ten days, thus securing the payments on a thirty-day cash basis. At present the average time between the date of an invoice and the receipt of the vouchers by the Finance Department is about two months in the case of the Departments of Education and Fire; three months or more in the case of the Department of Corrections, while the Department of Street Cleaning seems to top the list with delays of as much as fourteen months, and in no case less than two or three.

These delays the comptroller attributes to lax business methods in the departments and offices of the city government, and they have, he states, "given our city an unenviable reputation among its own contractors, merchants and trades people, and have forced many of our best business houses to refuse city orders." There have even been numerous instances where the city's regular employees have been compelled to wait two or more months for their pay, thus causing great hardships, especially among those whose pay was so small as to preclude the possibility of laying aside very much to meet this or other emergencies.

STATE CONFERENCE OF MAYORS

For a great many years superintendents and engineers of water works plants and other officials engaged on city improvements and utilities, and civil engineers generally, have united in organizations meeting once or oftener each year to compare notes and discuss matters connected with the work in which they are engaged, with the idea of profiting by each other's experience. Recently this idea has been taken up by other classes of city officials, especially those whose official functions are in the nature of a profession, such as health officers and comptrollers; but a convention and conference of mayors, not for mere social enjoyment but for actual comparison of ideas and acquisition of information useful in their office, is something comparatively new.

Such a conference was inaugurated last year by the mayors of the second and third class cities of New York State, and a second is to be held on May 25, 26 and 27 at Poughkeepsie. The serious aim of this convention is evident by an inspection of the program. This shows the morning of the first day occupied with addresses and discussions on the cleaning and care of streets; the afternoon on municipal accounting and the evening on the police department. On the second day the morning is to be devoted to a discussion of taxation and assessments and municipal transit; the afternoon to commission and other forms of municipal government, and the evening to a continuation of the same topic. During these two days the only thing in the nature of amusement on the program is a visit to West Point between 4.30 and 8.30 p. m. of the first day, and a clam-bake in place of dinner on Friday. The third day is occupied by a discussion of municipal water supplies and a trip to the Ashokan dam. The leaders in the discussions of the several subjects include prominent city engineers, street lighting experts, comptrollers, tax commissioners, legislators and mayors.

A conference of this kind indicates an appreciation of the great responsibilities of their positions by the mayors of the second and third class cities of New York and a serious intention on their part to do the best for their cities which they can, not only with the information already at their command but with any which they can acquire. In other words, it would appear that our city officials are coming to realize more strongly the duties attached to their positions and are not contenting themselves with merely enjoying the honors.

Fine Mesh Screen Lessens Sludge and Scum—Effect of Time Baffles and Scum Boards in Sedimentation— Philadelphia Experiments

Among the tests made at the Philadelphia Sewage Experiment Station was a series on the use of a fine-mesh screen. The conclusions from these tests are reported as follows:

Crude sewage was played through twenty-four $\frac{1}{4}$ -inch nozzles set to discharge at right angles to the conical surface of fine-mesh screen, composed of red metal cloth having thirty-two meshes per inch, leaving clear openings of $\frac{5}{10}$ millimeter by $\frac{5}{10}$ millimeter. That portion of the applied sewage which did not pass through the screen splashed over the surface, washing the screenings down into a gutter and thence to the drain.

On account of the construction of the screen it was not possible to obtain the screenings in a semi-dry state, as the splashing water washed them away. As the screen removed all the large solids which could not be included in analysis by a Gooch crucible, a mere comparison of suspended solids in the influent and effluent would give a lower percentage removal than the truth, and it must be borne in mind that the sewage applied to the fine screen had been withdrawn from beneath the surface of the flow in the intercepting sewer, had passed through a coarse screen, and had passed through a plunger type pump. The percentage removal of suspended solids by the screen is therefore not comparable with a disposal works screen.

The crude sewage applied to the screen during its entire run contained on an average 200 parts per million of suspended solids as measured by the Gooch crucible, and the average effluent 133. This would represent a removal of 33.5 per cent of the suspended solids, or 560 pounds dry solids per million gallons sewage screened.

As a check upon these figures a run was made on two tanks under identical conditions, except the influent to one was screened and to the other was crude sewage. The difference in the amount of dried residue deposited in the tanks was used to determine the percentage removed by the screen. Allowing for the inaccuracies in sampling both the sewage and sludge the test indicates a removal of 37.3 per cent of the total suspended solids in the crude sewage by the fine-mesh screen.

For comparison with an actual installation of a fine screen of similar mesh to the one described, the operation of the Reading plant, as reported by Mr. Emil Kuichling in his notes on "Sewage Disposal for Rochester" (MUNICIPAL JOURNAL AND ENGINEER, June 1, 1910), may be of interest. There the crude sewage contained 215 parts per million of suspended solids, and the screened sewage 125, showing a removal of 90 parts per million, or 750 pounds of dry solids per million gallons sewage. This is a removal of 41.8 per cent of the total suspended solids.

The most important result of the fine-mesh screening of a sewage containing trade wastes, such as wool and hops, was the fact that the screened sewage contained no particles larger in size than one mm, as frequently determined by microscopic measurements, and as the clear openings in the screen used were 0.5 mm. square, only soft flexible solids larger than that size would be driven through by the force of the jets. This means that the irregularity of the load of suspended solids upon a sewage disposal plant produced by the erratic contribution of trade wastes would be eliminated by fine-mesh screening.

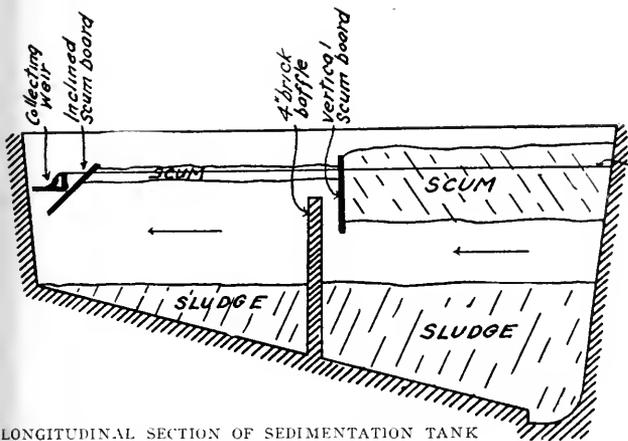

The use of a fine-mesh screen produces a marked effect upon the sludge collected in subsequent sedimentation, lessens the quantity of sludge produced, increases its percentage moisture, and by removing all large particles yields a sludge composed of very finely divided solids, consequently easily pumped.

If sprinkling filters are used, the clogging of nozzles is re-

ced to a minimum—in fact, the nozzles of the lower sprinkling filter, the influent of which was settled screened sewage, were never clogged during its nine months' operation.

SEDIMENTATION

Sedimentation by horizontal flow was studied in three tanks, and in addition a modification of the Emscher tank was used in studying vertical flow. Of the horizontal flow tanks one had a ratio of depth to length of 1 to 1½; a second, 1 to 2½, and the third a ratio of 1 to 4, the last being found the best proportion. These all had level bottoms at the beginning of the experiments, but the two first were given bottoms with a slope of 16 degrees to the horizontal later on, the deepest portion being at the inlet end. At first there were no baffle walls in the tanks, but during the later experiments sludge baffles, scum boards and effluent weirs were provided. The illustration shows the general form of the first two tanks and the location of the baffles and scum boards.

LONGITUDINAL SECTION OF SEDIMENTATION TANK

The experiments with these tanks indicated that when the storage period—that is, the time nominally occupied by the sewage in passing from the inlet to the outlet end—exceeded ½ or 3 hours there was a very slight increase in the percentage of suspended solids removed, and that consequently this length of time appeared the most economical. Although no reference is made to it in the report, it is probable that the velocity of flow is an important consideration, and that the economical length of storage period increases with the length of the tank. The sloping bottom gave a certain advantage, in providing a storage place for the sludge without too greatly contracting the area of flowing sewage. Much more beneficial, however, were the baffles and scum boards, the former resulting in confining near the inlet end a large part of the sludge, thus leaving the outlet end with a larger cross-section, which gave lower velocity to the sewage and thus permitted the depositing of the finer and lighter suspended matters. There was also less tendency to gas formation in this outlet end, and thus less taking of fine matter into resuspension by the flowing sewage. The scum boards similarly retained a very large percentage of the floating matter near the inlet end, thus permitting the free escape of gases from the sewage in the outlet portion of the tank.

The third tank was divided into three sections by two baffle walls, and it was found that two-thirds of the sludge was deposited at the inlet end, one-fourth in the middle section and the remaining one-twelfth in the outlet section. Another advantage of the use of baffle walls was that it secured a more uniform flow throughout the vertical cross-section of the tank. When the tanks were unbaffled it was found that visible trade wastes passed from the influent to the outlet end at a rate which showed a current of high velocity through the tank, thus implying low velocities through other portions of the vertical cross-section, but after baffles were provided these evidences of high velocity were not noticed.

A part of the sewage passed through the tanks had previously been screened by the fine screen described above, and practically no scum collected on the tanks through which this screened sewage was passing.

The percentage of suspended solids removed varied from about 59 to about 77, and the parts per million remaining in the effluent varied from about 45 to 81. The figures are not directly comparable, however, as the sewage used in the tests varied in strength from day to day.

The experiments in vertical flow sedimentation were made with a cylindrical tank 10 feet deep and 5 feet in diameter. A tank only 5 feet deep was used at first and found too shallow for effective sedimentation. The crude sewage was compelled to pass downward from an inlet in the center of the tank to a depth of about 4 ft. 6 in., and then to reverse the flow and pass upward to an overflow at the circumference of the tank. A 10-inch tube through the center of the tank permitted the escape of the gases. A space about 4 feet in depth in the bottom of the tank was available for the collection of sludge. The method of depositing solids was entirely different from the Emscher construction, except that the digesting chamber at the bottom of the tank was separated from the upper portion where sedimentation took place so that the gases given off by the sludge could not rise and carry solid matter into the effluent. The effluent from this showed no appreciable loss of dissolved oxygen nor reduction of nitrites or nitrates during its passage through the tanks, which was attributed to the fact that the gases of decomposition from the sludge did not reach it. The sludge was found to be very low in moisture, uniform in consistency and free from hydrogen sulphide or other gas having objectionable odors.

MASSACHUSETTS EXPERIMENT STATION

LAWRENCE, MASS., April 14, 1911.

Editor MUNICIPAL JOURNAL AND ENGINEER,
239 West 39th St., New York, N. Y.

Dear Sir—You state in an editorial in this week's issue of the Municipal Journal and Engineer, when speaking of the Philadelphia sewage disposal experiments, that "while the experiments of the Massachusetts State Board of Health and the reports upon the same, which are unsurpassed for completeness and scientific thoroughness, are recognized in Europe as well as in this country as being of the greatest importance and reliability" that "their value has been somewhat restricted during the past few years by a conservatism in the adoption of new ideas, which seem to us unnecessary and unfortunate." As you have made this statement I should be glad to have you inform me just what new ideas in sewage disposal the Experiment Station has failed to "adopt," or in other words, just what method of sewage purification has not been either developed or thoroughly studied here, just what data in regard to modern methods of sewage disposal are lacking in our reports? Trickling filters were in operation here before being operated, I believe, anywhere else in the world, and are still continued in operation. Contact filters, septic tanks, etc., have also been studied through many years and data in regard to them given in our reports. Moreover, whatever Mr. Dibdin may say to the contrary, slate contact filters were in operation here several years before being operated in England by him, and we had no knowledge when we started them that he had written a letter to some English engineer in regard to such filters. A two-compartment septic tank for the concentration and disposal of sludge, somewhat similar to the present Imhoff or Emscher tank, was operated here in 1899 and 1900, eleven years ago, and a description of its results can be found in our reports for those years. During the past two years, moreover, such tanks have again been studied. In looking over the Philadelphia report, of which I have a copy, I find little or nothing new. It is simply a much to be commended trying out of methods of sewage disposal as applied to the Philadelphia problem. In fact, I am fain to believe that you criticise Lawrence work without being sufficiently familiar with the large amount of data in regard to all modern methods of sewage purification published in the reports each year. Yours very truly,
H. W. CLARK,
Chief Chemist.

In the article Mr. Clark refers to we intended to distinguish between "experiment" and "adoption." We practically stated all that he claims as to the thoroughness of the *experimenting* done by the board, limiting our criticism to the *adoption* or approval of processes for use by Massachusetts cities. The most recent case in point is the refusal of the board to approve of the use of rapid sand filtration by cities, in spite of its recommendation by most sanitary engineers.

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Street Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Good Roads Experiment

Fort Worth, Tex.—A suggestion from W. G. Turner and approved by the Board of Trade is to be given a practical test on the Tarrant County roads, the most used road in the county being selected for the test. The suggestion or assertion is that it is cheaper as well as better to keep a road in repair than to let it run on until general repairs are required. The stretch of road from here to Arlington is the one selected for the experiment, a part of the Fort Worth-Dallas pike. A road keeper has been appointed, who began work last week. It will be his duty to keep the road in the highest state of efficiency, and for this purpose he is provided with a horse and cart and such tools as a man can use, shovels, picks, etc. His duty will be to fill all depressions with gravel or whatever may be the road material, so that the surface of the road may be maintained at its proper level; open and keep open all drainage ditches, and keep the weeds and brush along the sides of the road cut down. In fact, his work will have about the same scope as that of the railway section hand. After the road is built and properly surfaced it is claimed that one or two men can keep it in perfect repair all of the time. This it is claimed will be cheaper than letting it go down and then rebuilding it with large outlays, as has been done in the past.

Plan Central Boulevard Through City.

Providence, R. I.—In a report made public last week by a special municipal commission appointed for the purpose, Providence's most troublesome engineering problem that has vexed the souls of the city fathers for the past half century, namely, a commodious and convenient thoroughfare from the center of business interests to the East Side residential section, seems in a fair way of meeting an adequate solution. The engineering member of the commission is John R. Freeman, a consulting engineer of wide renown, who was one of the board to inspect the Panama Canal at the invitation of the United States Government. Under his supervision plans and estimates have been prepared, which provide for the construction of an easy grade street with a maximum width of 100 feet, intended for all classes of travel, to reach from the new Federal Building and post office, at the foot of the city's civic center, to the top of College Hill, and to cost in the neighborhood of \$1,350,000.

Town Buys Stone Crusher and Plant

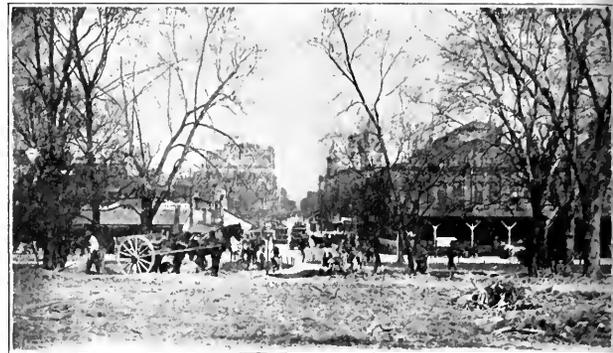

South Burlington, Vt.—The town of South Burlington has purchased the stone crusher and plant of the E. F. Morse estate on the Williston road and will use it in furnishing material for road work this summer. The principal object in buying the plant was to make work easier and less expensive on the Williston road. State Road Commissioner C. W. Gates has expressed a desire to have the present excellent road which goes part way continued as far as the Williston line, and with the aid of the State that can be accomplished, although it would be out of the question under former conditions, when stone was purchased from the Phelps or city quarries, as the haul would be too long.

Citizens Offer to Pay for Oiling Streets

New Britain, Conn.—Owing to the shortage of water in Shuttle Meadow reservoir, it is not deemed best to sprinkle the streets with city water at present. The residents of West Main street have been greatly inconvenienced by the gales of dust and W. L. Hatch conferred with President J. E. Moore of the Board of Public Works to see if a plan could be devised to eliminate the dust. Speaking for himself and a few other property owners on West Main street, Mr. Hatch said that he would be glad to pay a special assessment for sprinkling the street with oil.

Oil Macadam Driveway for Smithsonian Grounds

Washington, D. C.—A new oil macadam driveway, practically 30 feet wide, flanked on either side by 6-foot cement walks, is being constructed in the Smithsonian grounds at the Ninth street entrance from B street North. It will connect with the driveway which passes the front of the new National Museum Building and with the driveway which sweeps down through the center of the grounds from the Smithsonian Building, thus offering outlets on Seventh

Courtesy Washington Star.

EXTENDING NINTH STREET THROUGH THE MALL

Ninth and B streets south as well as north. Workmen have already begun to plow the ground and lay out the driveway and walks. Its construction necessitates a modification of the curve of the driveway from the south which now divides at the east side of the museum building, which is also being made, the curve being lessened and the outlet to Seventh street made more direct. This work is being done under the supervision of F. F. Gillen, of the office of Public Buildings and Grounds, and under the immediate direction of C. H. Tompkins, engineer of the Smithsonian Institution.

Merchants Favor Broader Streets

St. Paul, Minn.—Barring some legislative difficulties that probably will have to be settled, the people of St. Paul, according to the sentiment reflected by merchants in the retail business district, are ready to enter on the project of widening the thoroughfares in downtown sections. Several managers of big department stores who were seen favorably without exception the widening of the streets. Except as regarded Wabasha, there was not entire unanimity of sentiment as to which streets should be widened first. Everybody agreed that Wabasha street should be widened. It was thought necessary both to relieve the congestion along this street and to widen it in order to conform to the plan of beautifying the city as embraced in the projects for Capitol approaches. Many who talked of that street in particular also declared the Wabasha street bridge would have to be widened or doubled in order to make the entire plan harmonious. In some quarters there was a disposition among the merchants to hold aloof if the plans proposed should embrace additional costs to the municipality. The plans that commanded general indorsement were those followed in Philadelphia, where the streets have been widened slowly by the establishment of lines to which buildings must conform within fifteen or twenty years.

Hagerstown Turnpike Now Free of Tollgates

Hagerstown, Md.—The final details of the purchase of the Hagerstown and Conococheague Turnpike by the State were completed last week and the road declared free of tollgates. T. A. Poffenberger, representing the State, received a draft for \$22,500, which he turned over to the Turnpike Company, and the deal was closed. Notice was served on tollgate keepers to stop collecting tolls.

SEWERAGE AND SANITATION

City Will Adopt Health Reform

Manitowoc, Wis.—Rigid reforms, among which are medical inspection of public schools, elimination of swine from city and other things recommended by the city health board are before the City Council and will become city ordinances.

Plan Engineering Division of State Board of Health

Pensacola, Fla.—At the twenty-second annual meeting of the State Board of Health of Florida, held February 14 and 15, 1911, at Jacksonville, the Board instructed the State health Officer to have drafted a bill to be placed before the Legislature, which, if adopted, would provide for a sanitary engineering division of the State health work. The State Board of Health has for a number of years at its annual meetings been impressed with the necessity existing throughout the State for expert advice and supervision of the installation of public water supply systems, the construction of plants for the proper disposal of sewage and domestic wastes, and also in relation to drainage in so far as these matters may affect the public health.

City Installing Sanitary Drinking Fountains

Pasadena, Cal.—The first of the cupless drinking fountains which the city is installing is now in place and working, the porcelain font being placed where formerly stood the cast iron affair for man and beast, at the City Hall corner. It is the plan of the city to install four or five more of similar design and the next will be placed at the corner of Colorado street and Raymond avenue, where a similar cast iron fountain will be displaced.

Health Department Scrutinizes Bakeries

Jacksonville, Fla.—E endeavoring to have a clean and healthy city, Chief Sanitary Inspector George C. Floyd, of the City Board of Health, is carrying on the good work vigorously, and has notified all of the bakeries in the city to properly screen their places of business to prevent the invasion of flies.

State Department Orders Sewers Accepted

Lackawanna, N. Y.—On authority based upon an order from the State Department of Health, the Board of Health of Lackawanna has served notice upon Mayor Reed and other city officials, including Dr. Ira P. Trevett, president of the Lackawanna Board of Health, to open the sewers of Lackawanna to public use. The order is signed by Dr. Eugene H. Draper, State Commissioner of Health. Dr. Trevett said last night that he did not believe that the order would conflict with the legal proceedings now on to prevent the acceptance of the sewer by the city. He said that there was no epidemic at Lackawanna, but there were conditions that might cause trouble if the city was allowed to continue as it did last summer without means for the disposal of sewage. On that account, he and members of the Board of Health laid the matter before the State health authorities a few weeks ago and the order was the result. The troubles Lackawanna has had over its sewer have been kept before the public for the last two years. The indictment and conviction of members of the old Town Board of West Seneca were part of the troubles. On appeals and otherwise, those cases are still in the hands of the District Attorney. On the last day of its existence the old Town Board was served with an injunction restraining it from accepting the sewer and making the final payments to the contractors. The injunction was obtained by the Lackawanna Steel Company. It was based upon the allegation that the sewer was not built according to contract and was otherwise faulty. The injunction was continued against the city of Lackawanna. The matter has since been in the courts. George Clinton was appointed referee to take testimony and decide upon the merits of the contention that the sewer was improperly built. He has not yet rendered his decision. Pending the adjustment of the proceedings, residents of the city have been prevented from making connections with the sewer. It would seem that the order of the State Board of Health conflicts with the injunction.

Town to Have Sewer System

Melrose, Minn.—Contractor A. F. Dueber has started a crew of men to work digging for the new sewer which the city is putting in. The system will cost \$12,000 and will extend through the entire business section and along several of the best residence streets in town. Two miles of pipe will be laid. The system is so planned that extensions can be made from time to time, and before long the entire town will be supplied.

Sewerage System Completed

Gaffney, S. C.—At last, after a wait of two years, Gaffney's sewerage system is completed and is now in use. The filter plant has been finished, but is not yet in use. The enormous new standpipe, which doubles the capacity of the old one, has also been completed, and doubtless the water will be turned into it at no distant date. On the whole, the people of Gaffney have reason to feel proud of what they have accomplished in this line. The sewerage system was installed by Bowe & Page, of Charleston and Augusta, while the filter plant was built by the Greer Filter Company, of Pittsburg, Pa. The sewer system was installed at a cost of \$75,000, while the new filtering water plant cost about \$35,000. The bonds were voted for \$125,000.

Take Steps to Secure Ventilation of Playhouses

South Bend, Ind.—South Bend photo-playhouses may be compelled to install exhaust fans as a means of purifying the air in the small theaters according to action taken at a meeting of the Board of Health. Authorities have spent several weeks investigating conditions in the smaller houses and have made preliminary plans to compel the installation of fans. Officials have been instrumental in causing a number of photo-playhouses to be filled with smoke that it might be seen if the air moves in a sluggish manner in the theaters.

WATER SUPPLY

State Board Investigates City's Water

Lima, Ohio.—An investigation of the Lima water works system is being made by the State Board of Health, L. H. Van Buskirk, engineering assistant, being here analyzing samples of the city water.

Filtration Plant Nears Completion

Cohoes, N. Y.—That the filtration plant will be in readiness for use by the early part of next month is the inference of a communication which the Board of Water Commissioners has received from the New York Continental Jewell Filtration Company, the concern which is doing the work. It is stated that the strainer system is finished, and the gate stands are being placed in position. The sand and gravel for the filter beds has arrived, but cannot be hauled to the plant until the roads dry up. Experts will be in Cohoes soon to test the gas engines and producers and connect the electric cables. The large standpipe is still to be tested and connected with the city water main on Vliet street. City Engineer George Bolton has declared that he is perfectly satisfied with the work that has been accomplished on the plant.

Municipal Plant Too Small

Orangeburg, S. C.—The present capacity of the local water, light and power plant has been exhausted and the plant must be enlarged. The present location of this plant is very near the center of the city and some distance from the railroads. As the city has purchased the opera house property for a City Hall, the present City Hall, which is located on the plant property, will have to be torn down and this space used. The water reservoir will also have to be made larger.

Council Fixes Water Rates

Gunnison, Utah—April 1 has been set by the City Council as the date on which to begin the water rate. The amount of \$12 was fixed as such rate and \$10 for making connections. These amounts were ordered paid in advance and the recorder was ordered to send statements to all water users accordingly.

City Will Have Pure Water by May 1

Niagara Falls, N. Y.—Pure water before May 1 now seems assured. Engineer W. D. Robbins reported to the Board of Water Commissioners last week that the new pumping station is almost ready for starting the work of pumping water from the green channel at the foot of Buckhorn Island. The Allis-Chalmers Company has the pumps all set, the motors in shape for the test, and nearly all the cables ready to connect. Smith Brothers have the station all completed with the exception of cleaning up the refuse, the Elderfield-Hartshorne Company have the heating and steam pipes and other plumbing finished, and all that remains to be done is the completion of the work of laying the cable to the intake crib. The filtration plant will not be ready before fall.

Add to Water Supply for Summer Use

Tacoma, Wash.—In an effort to forestall any water famine this summer, Commissioner of Light and Water Nicholas Lawson has started the digging of another well in the South End to get an extra supply of water. A crew of men at work for a week struck water at a depth of 17 feet in the well last week. The excavation is being made at Bean and Lawrence streets, about two blocks from the Northern Pacific right of way. The well is 15 feet by 24 feet, the Commissioner deeming it more effective in that shape than if a pipe only were sunk. The water from the well will be pumped into the high service main and will be the means of relieving that section of the city where the largest number of complaints from water shortages are reported in the summer. The motor now at the Hood street pumping station will eventually be used at the new well.

City Fears Water Famine

Northampton, Mass.—The City of Northampton, which a few years ago thought it had a water supply that would be sufficient for a great many years, finds that notwithstanding the water commissioners have provided a storage capacity of nearly 500,000,000 gallons, in a long drouth, such as that of the past fall and winter, there is great danger of a water famine. Forty years ago, when the first reservoir was built, with a capacity of 100,000 gallons, it was predicted that this would be sufficient to supply the town with water for about 100 years. Engineer Goodhue of the State Board of Health is surveying the surrounding country for the purpose of recommending the most desirable place for a reservoir that will hold about half a billion gallons.

Municipal Ownership of Water System Considered

Bristol, Conn.—The hearing on the bill to give Bristol the right to municipally own and conduct a water system, either by an independent plant or by purchase of the property of the Bristol Water Co., was held in Room 60, Capitol Building, last week, before the Committee on Cities and Boroughs, Senate Chairman F. A. Bartlett of Bridgeport presiding. A good deal of time had been given to the preparation of the bill and several drafts had been made. The one submitted had been completed at a conference of the attorneys.

Plan to Supply Many Cities with Pure Water

Buffalo, N. Y.—Colonel Thomas W. Symons, U. S. A. (retired), who for many years was stationed in Buffalo in charge of the work on the government breakwater and other federal engineering, believes that he has a feasible method by which Buffalo and all the Niagara Frontier cities may have pure water at a reasonable cost. Colonel Symons has written a letter to Mayor Fuhrmann, of Buffalo, in which he suggests a Niagara Frontier water supply district, including Buffalo, Tonawanda, North Tonawanda, Niagara Falls, Lockport and such other communities as may wish to come in. Colonel Symons declares it is impossible to get pure, unpolluted water from the Niagara River and that when obtained from that source it can be made fit for use only at great expense. Water obtained from the middle of Lake Erie is, according to Colonel Symons, unpolluted and unpollutable. This is true, he says, of the Emerald Channel, which Buffalo's new inlet pier taps. The suggestion of Colonel Symons is that a water supply district be organized which Buffalo can supply for many years to come if the new pumping plant is equipped as contemplated.

STREET LIGHTING AND POWER

Cumberland's Lights Cheapest in Country

Cumberland, Md.—The report of Commissioner Smith of the Water and Electric Department shows Cumberland lights to be the cheapest in the country. The total cost of operating the department for the last 10 months, including interest on bonds, was \$9,048.93. This amount divided by 333 lamps, gives \$27.17 as the cost of a lamp for 10 months and \$2.71 a lamp for a month, or \$32.52 for 12 months.

Ornamental Lights Installed by Property Owners

Jacksonville, Fla.—The ornamental street lights on Forsyth street are being extended from Julia to Cedar on the south side by the Gas Users' Association. Workmen are now busily engaged in putting down the underground cables and the work will be rushed to completion with all possible speed. The lights will be the same as are now in use on Forsyth from Main to Julia, being the Corinthian column, surmounted by a cluster of globes. Twelve columns will be placed in the block by the association, as they will greatly improve abutting property, as well as being useful for illuminating purposes.

Mayor Vetoes Gas Franchise

Columbus, O.—Advising that the City Council appeal to the Legislature for aid in compelling public service corporations to furnish information concerning their business upon which the fixing of fair rates may be based, Mayor Marshall vetoed the ordinance passed three weeks ago granting the Columbus Gas and Fuel Company a franchise to furnish gas for 10 years at 30 cents per 1,000 feet for the first five years and 35 cents for the last five years. If sufficient information were at hand, the Mayor says, he believes it would be shown that a 15 or 20-cent rate were sufficient to do business at a profit, unless the stock is watered. If the Legislature will not pass the required legislation Mayor Marshall recommends the granting of a two years franchise at a 30-cent rate. In the meantime, he thinks the constitution would be amended so as to give cities the desired power. The company's franchise expires July 1 and the officials have threatened to turn off the gas supply unless a 35-cent rate is granted.

Plan Better Lighting for City

Saginaw, Mich.—The special committee of the Board of Trade on a better lighting plan for this city has recently visited Lansing to inspect the municipal lighting plant there, which Secretary Tracy of the Board says is the best of its kind for a city of similar size in the country. This step may lead to a city-owned lighting plant and commission government. Saginaw has had considerable trouble over rates and the figures given by the report of the committee show what can be done if controlled by a commission. Saginaw has voted to revise the charter, which may lead up to a commission government. The inspection of the Lansing plant and the gratifying results is the opening wedge to a change in the city's life.

Planning for Municipal Light Plant

Sharon, Pa.—Explaining his remark in Council that the city would be no further in debt five years from now than it is at present, even should the city decide to construct its own electric light plant, Chairman John S. Spencer this morning said: "At the present time our electric lights are costing us \$12,000 a year, which is between one-seventh and one-sixth of our total revenue. It is too much for a borough the size of Sharon to pay. By saving the electric light rental each year and what we will be able to save out of the city's revenue we expect to be able to pay the entire cost of the building of the electric light plant in the five years. Every member of Council is now working to ascertain the feasibility of putting the plant in."

Wires Go Under Ground

Indianapolis, Ind.—An order was issued by the Board of Works of this city to all service corporations that all wires within the "miles square" must be placed under ground by September 1 and that the work must begin by April 15. The order comes as a result of the recent fire horror in New York City.

FIRE AND POLICE

Records of Fast Runs by Chief Croker

New York, N. Y.—The following are some records of runs made by Chief Croker in his Mercedes 40-45, in response to alarms in various parts of New York. In making comparisons it should be taken into consideration that the path is well cleared; engines and other apparatus in case of the long runs may have preceded the Chief's car and there are many traffic policemen to warn pedestrians, vehicles and surface cars.

From 170th street and Amsterdam avenue to Broadway and Fifty-fourth street, 10 minutes.

From Great Jones street to 135th street and Southern boulevard, 13 minutes.

From Great Jones street to Beaver and William streets, three minutes.

Underwriters Test High Pressure System

Jacksonville, Fla.—A test of the high pressure system is recently given by Fire Chief T. W. Haney, when three representatives of the National Board of Fire Underwriters called on him and stated that during their stay in Jacksonville they wanted to see the high pressure pumps tried out.

Courtesy the Florida Times-Union.
TESTING HIGH-PRESSURE SYSTEM

After an hour's exhibition, in which at times as many as six streams were thrown at one time and measurements taken, they expressed themselves as satisfied. The system has not been used many times, but during a fire in January which threatened the wholesale district it did effective work.

Women Do Police Duty in Seattle

Seattle, Wash.—Women are to be given an equal chance with men in the Police Department in such positions as detectives, desk men and patrolmen. This was decided by the Public Safety Committee of the Council when a bill was presented for passage directing Chief of Police Banker to appoint a special police-woman to the first vacancy on the list of patrolmen. The committee directs the appointment to be made from an eligible list to be submitted to the Civil Service Commission. This bill will give every woman who makes application an opportunity to take the examination and the Chief will be required to make the appointment from the first three on the list.

New Police Signal System Tested

Buffalo, N. Y.—An inspection of the new police signal system recently installed in the third precinct was made last week. The inspection party was headed by Chief Egan. The new system has a number of boxes throughout the precinct with a red and green light that are used to call men out on their beats when wanted. Bells are also attached to be used in case of emergency. The system enables a man to be called anywhere on the street at any time and is considered a great improvement over the present method. It is proposed to install the system throughout the city.

Auto Hose Wagon Test Satisfactory

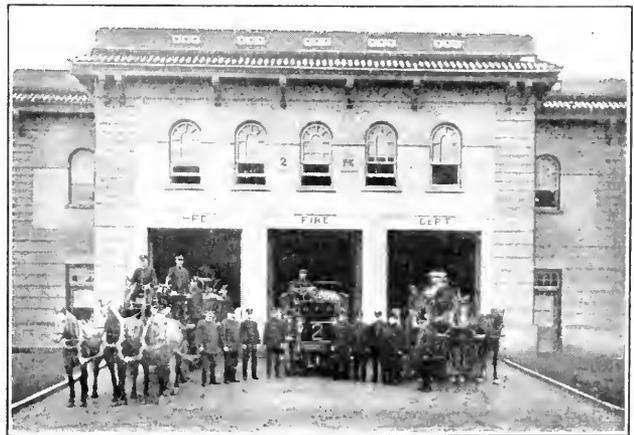

Long Branch, N. J.—The final test of the new Scagrave automobile hose wagon was made one day last week. Members of City Council met at the Independent fire house and, after inspecting the wagon, started out for a run. The trip to the West End section and back was made in good time, and the demonstrator showed the different features of the machine. Those who witnessed the various tests expressed themselves as being well pleased.

Take Steps to Secure Auto Fire Apparatus

Hanford, Cal.—At a meeting of the City Trustees recently, following a report of the Chief of the Fire Department regarding the number of calls answered, condition of apparatus, etc., it was decided to purchase a new auto chemical fire truck, and an effort will be made to trade in the entire present apparatus and secure up-to-date auto apparatus.

New Engine House Inspected

Hartford, Conn.—The Fire Commissioners have made their first official visit to the new fire house on Windsor avenue occupied by Engine Company No. 2. Three pieces of apparatus are housed in the building, a hook and ladder truck, a steam engine and an auto combination hose and chemical engine. The house is handsome in appearance and conforms in general to the style of the houses built in

Courtesy Hartford Times.
HARTFORD FIRE HOUSE PURCHASE PIECES OF APPARATUS

the city during the last two or three years. The wide entrance and accessibility of the apparatus to the street is the most noticeable feature. An open space in front of the wings of the building affords an opportunity for ornamentation with a lawn and shrubbery.

Girl Telephone Operator to Be Police Chief During Night

Wakefield, Vt.—Miss Helen Murphy, chief operator of the local telephone exchange, has been made night Chief of the Wakefield Police. Every half hour the patrolmen will call Miss Murphy by telephone and she will record the calls, which will be listed and submitted to Chief Pollard the following morning. In case she may desire to get into communication with any of the members of the force she has but to touch an electric button. This will light a red incandescent lamp which is attached to the box on the street. The patrolman upon seeing this must call at once to the young woman in charge, who will give directions as to what is required. The exchange will further serve as Police Headquarters in that persons may call up and report concerning fires, lost articles, robberies and all matters which would come under the police, emergency or fire category. This will be but a part of the young woman's work, as she will also be expected to take care of her telephone work. A feeling of apprehension for the welfare of the young operator and the town is expressed by some of the skeptical ones. They ask what would happen if she were to be held up by desperadoes who might force her to direct the members of the Police Department to go to distant sections of the town while they made their raids—if the young woman became suddenly ill when a big fire was in progress or any accident befell her.

GOVERNMENT AND FINANCE

Women on School Board

Springfield, Ill.—Springfield women last week elected two of their number to the City School Board. Eight hundred women braved the rain to vote.

Women Vote in Bronxville

Bronxville, N. Y.—Thirty women voted at the special election held in Bronxville last week to decide whether or not the village should undertake the care of the private roads in Lawrence Park. The proposition was carried by a vote of 53 to 50. The women were about equally divided, as were the men voters. Most of the women who voted were property owners directly interested in the question.

Franchise Is Amended

Wilmington, Del.—Amendments have been made by the Street and Sewer Directors to the franchise granted by them to the Wilmington Southern Traction Company to enter Wilmington by way of Market street from the New Castle Causeway. Under the amendments made last week the Wilmington Southern Traction Company shall pay 2 per cent of its gross receipts, based on the mileage within the city, to the city, but it is provided that this 2 per cent shall be charged against the company's taxes. If the taxes are more than the 2 per cent of the gross earnings the amount of the taxes shall be paid. The 2 per cent is not independent of the taxes required by law to be paid.

New Administration Favors Municipal Ownership

Eugene, Ore.—The city election last week resulted in a victory for the administration forces, the old guard electing the Mayor and two out of the four Councilmen. The Council will hereafter be composed of six Aldermen and the Mayor favoring municipal ownership and two Councilmen against.

New Segregation Ordinance Becomes Law

Baltimore, Md.—A new ordinance, providing as far as practicable for the residence of whites and negroes in different neighborhoods in this city, which had passed both branches of the City Council, has been signed by Mayor Mahool. The measure was introduced by Councilman Samuel L. West, author of a previous segregation ordinance that was declared unconstitutional.

Colorado Elects Thirteen Women

Denver, Col.—Thirteen women will head important municipal offices in Colorado as a result of last week's elections. Pueblo, the second largest city in the State, elected a woman auditor. Leadville, Telluride, Idaho Springs, Greely and Montrose elected women treasurers, as did also the smaller towns of Fairplay and Ridgway. Colorado City and Las Animas elected city clerks and Durango a woman alderman. The little town of Alma will have two women city officials, the city clerk and treasurer. There are four women members of the Colorado Legislature and one of the commissioners of the county of Denver is a woman.

Make Bonding Elections as Convenient as Possible

Binghamton, N. Y.—After giving the matter due consideration, Mayor John J. Irving has decided to sign the ordinance introduced by Alderman Walter Tayntor and passed by the Common Council at its last meeting, directing the Corporation Counsel to prepare an amendment to the city charter and send it to Broome County representatives at Albany, providing seven polling places instead of one for bonding elections. The Mayor is strongly in favor of giving every taxpayer the fullest opportunity to express his opinion as to how the money he pays into the city treasury shall be expended and to this end he believes that the ordinance should become a law. He accordingly signed the ordinance and the amendment to the charter will be prepared at once.

Sell Bonds to Improve Playgrounds

St. Paul, Minn.—At a meeting of the sinking fund and public playgrounds committees it was decided to sell \$8,000 of the authorized issue of \$25,000 public playgrounds bonds over the counter, City Comptroller Farnham having received subscriptions for this amount from individuals.

STREET CLEANING AND REFUSE DISPOSAL

Dispense with Unloading Station for Garbage

Toledo, O.—The recommendation of Mayor Whitlock and Service Director Cowell that garbage be hauled directly to the new disposal plant has been received with favor. The public affairs committee indorsed the proposition and turned it over to the finance committee to provide the means. This plan would obviate the necessity for a disposal and unloading station in the North End, which residents of that section have been fighting for a year. A large delegation of them attended the meeting of the committees last week.

Municipal Spring Clean-Up Becoming General

Syracuse, N. Y.—In the general street cleaning plan inaugurated by the Commissioner of Public Works, Frank M. Westcott, about 210 men and over 70 teams were employed on Sunday cleaning the paved streets in which it is difficult to work on week days because of heavy traffic. Mayor Edward Schoeneck and the Commissioner later made an inspection of the street cleaning in all parts of the city. They said that the work is progressing rapidly. The foremen in all the wards will organize gangs of men and start cleaning up the unpaved streets. The road machines will be used, and preparations made for using broken stone and making other improvements. The laying of crosswalks and sidewalks will be ordered as soon as danger from frost is past, which will probably be about the last of next or the first of the following weeks. Bids on several sidewalk jobs have been received and contracts will be awarded within a few days. The aldermen have started proceedings for some 12 or 15 new sidewalk jobs on which bids will be submitted in a short time. Two electric sprinkling carts and three flushing machines are in use under the orders of Commissioner Westcott to the contractors. Other carts will be put on and it is expected to have all the carts and machines in operation soon.

Hagerstown, Md.—The Civic League has petitioned the Mayor and City Council to set aside a clean-up day. It is the purpose to make the day a holiday in the public schools.

Wilkes-Barre, Pa.—By the Mayor's official order the first week in May has been set apart as clean-up week.

Trenton, N. J.—Trenton will get in line with the other Eastern and Western cities that are setting apart a special "Spotless Town" day.

Spokane, Wash.—Arbor Day has been designated a clean-up day in Spokane. The Mayor will proclaim a public holiday.

Demonstration of Street Flushing Machines

Newark, N. J.—A demonstration of flushing machine was given for the benefit of the Board of Works Commissioners last week at Broad and Clinton streets. A dozen machines were used. There was one apparatus of the automatic mobile type used as a sweeper to pick up refuse. Acting Chief Engineer James C. Hallock arranged the demonstration after a visit with General Superintendent Shipman of Brooklyn, at the invitation of Mayor Gaynor of New York. The commissioners expect to purchase three machines.

Streets May Be Flushed

Fulton, N. Y.—Up to within the past year or two the streets were regularly flushed twice a week, but owing to the lack of water the practice was discontinued. At that time the water users were being supplied at a flat rate, but since then all places are supplied at meter rates. Consequently not near the amount of water is used. It has been suggested that if the supply from Great Bear Spring was not sufficient that one of the fire engines be used for the purpose and that the water be drawn from the canal. This could be done twice a week at practically no cost and it would be a great benefit to the city. It is possible that the Chamber of Commerce may take up the matter.

Trolley Sprinklers in Use at Woonsocket

Woonsocket, R. I.—The trolley sprinkler furnished for use here by agreement with the Rhode Island Company was operated here for the first time last week. The trolley sprinkling will cover all streets through which car tracks run, leaving five watering carts to cover other sections.

For Clean Streets

Waterbury, Conn.—Supt. Benjamin Chatfield has announced that he is preparing to start in very soon on his crusade for clean streets. He realizes that the only possible way to secure them is to have the co-operation of citizens, and to this end he is having prepared notices in English, Italian, Lithuanian and Hebrew, setting forth the need of care on the part of residents in keeping their yards clean of papers and refuse. These notices will be posted about the city in the localities where the yards are most freely littered. If the notices do not have any effect more drastic measures may be tried.

Salt Water Is Used for Street Sprinkling

Salem, Mass.—Salt water is being used to sprinkle the streets of Salem. People are satisfied with it. Indeed, few notice any difference between salt and fresh water. The salt water is cheap, especially in these times when fresh water is alarmingly scarce. An electric pump has been set up on the shores of the South River. It pumped 600 gallons of water into a watering cart in 54 seconds. Another pump will be set up on the banks of the North River. It is expected that the salt water will be used all summer for sprinkling the streets.

RAPID TRANSIT

To Extend Chester Trolleys

Chester, Pa.—This city is to have another trolley line running the entire length of the city from east to west. The Philadelphia Rapid Transit Company has in contemplation the construction of a branch line extending from its present Short Line, at its new bridge spanning Ridley River to Fourth street and Highland avenue, in the extreme western section of the city, thereby giving the residents of that part of the town the convenience of a direct trolley route clear through to Fifteenth and Market streets, Philadelphia.

New Type of Cars for Topeka

Topeka, Kan.—The Street Railway Company has just received a shipment of six new cars, which will be placed in service at once on the Potwin-West Eighth street line and on the new Douthitt avenue line, which was built last fall and opened to traffic early last January. They are pay-as-you-enter cars of the double-end type, with enclosed vestibules on each end.

Paint Street Cars as Safety Measure

Chicago, Ill.—Painting street cars a light color instead of a dull, dark color, as they are at present, and the installation of new model cars with inclosed platforms were suggestions incorporated in the monthly report of City Attorney Clyde L. Day as tending to increase the safety of both street car patrons and pedestrians.

Franchise Is Granted

Chesterton, Ind.—The Chesterton Town Board granted a franchise last night to the Calumet United Railways for an interurban railway to connect Chesterton with East Chicago. This new road is supposed to be a link in the Northern Indiana system. The company is backed by the United Gas Company, of Philadelphia, and \$10,000,000 will be spent in electric lines in the Calumet district.

Traction Company Must Pay for Avoiding to Clean

Pittsburg, Pa.—A verdict for \$226,000 in favor of the city in its suit against the Pittsburg Railways Company to recover the company's share of cost of street cleaning has been returned by a jury that had been engaged on the case for two weeks and two days. The city sought to recover \$500,000 and interest, which increased the total to \$704,945.

Pay-as-You-Enter Cars in San Francisco

San Francisco, Cal.—Pay-as-you-enter cars are now in use on the Sutter-Jackson streets line, and have met with favorable criticism from the public. It is intended to extend the system as rapidly as possible.

MISCELLANEOUS

Favor City Abattoir

Grand Forks, N. D.—The City Council stamped its approval of the establishment of a municipal abattoir at the regular meeting and appointed a special committee to confer with the Commercial Club and Civic League and make a thorough investigation before final action is taken.

Mail Tube System for Cincinnati

Cincinnati, O.—A pneumatic tube mail carrying system is to be installed here. Cincinnati has been selected especially for the first trial of 30-inch tubes. All those at present in use in other cities of the country are very much smaller, being generally eight or ten-inch tubes. These will all be supplanted by the larger size in the event the experiment in this city is a success.

Property Owners Take Steps Toward Civic Improvement

Niles, O.—One of the most interesting sessions ever held in this city was that engaged in by the property owners of Sayers avenue last week at the Board of Trade rooms. The gathering was rather unique in some ways, one of the kind never having been held in this city before, and was called for the purpose of deciding upon a method of improvement which would be uniform in design and add to the beauty of that select residence location. The matter of sidewalks, planting of trees, regulation of trolley and telephone wires were discussed and a committee was appointed to lay before the City Council the improvements desired.

Urge Creation of Playground Board

St. Paul, Minn.—Creation of a public playgrounds board which would have power to carry out the measures considered best for playgrounds of the city is advocated in the annual report of the St. Paul Public Playgrounds committee filed with the Park Board at its last meeting. As constituted, the playgrounds committee is merely an advisory body and all its recommendations must be approved by the Park Board before they can be put into effect. The report holds the greatest difficulty in providing proper playgrounds for the city lies in the indirect form of management of the work. It is suggested this condition be corrected in the proposed new city charter.

Mayor Endeavors to Save Shade Trees

Tampa, Fla.—Mayor McKay has sent to the Council a communication in which he voiced his disapproval of the resolution which passed the Council at the previous meeting of that body, which called for the removal of all shade trees between the curb line of all streets in the city. His communication was accompanied by a resolution passed by the Tampa Civic Association.

Plan Municipal Playgrounds

Lawrence, Kan.—A movement which is expected to result in municipal playgrounds for Lawrence children was instituted last week when committees from three civic organizations met to discuss feasible plans for inaugurating such an innovation here.

Burlington, Vt.—Mayor Roberts has been requested, in accordance with a resolution passed last week by the Board of Aldermen, to appoint a playground commission, with a view to obtaining some place in the city where the children may play this summer.

Poles and Signs Must Come Down

Vincennes, Ind.—The first step toward improving the appearance of Main street was taken at a regular session of the Council, when an ordinance was presented and read the first time, which is designed to have removed from that street all unsightly poles and dangerous and unsightly overhanging signs of every description. The ordinance, after being read, was, on motion of Councilman Heltert, referred to the committee on civic improvement.

Start Work on New Municipal Building

Chico, Cal.—The ground has been broken for the erection of Chico's new \$30,000 municipal building. Contractor E. D. Sharp had a number of excavators at work, and declares that from now on the work will continue unabated.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Defective Sidewalks—Notice.

City of Haskell vs. Barker.—In an action against a city for injuries from a defective sidewalk the court instructed that what facts would be sufficient to constitute notice to the city is a question for the jury, and unless the city through some one of its officers had notice, either actual or constructive, of the defective sidewalk, then the city was entitled to a verdict. Held, that the instruction was erroneous, as it stated in effect that notice to an officer of the city who has no authority over the streets and sidewalks would be notice to the city.—Court of Civil Appeals of Texas, 134 S. W. R., 833.

Prisons—Nuisance—Liability.

City of Bowling Green vs. Rogers et al.—The keeper of a prison is liable for damages resulting from his negligent failure to keep it clean and sanitary and to see that the prisoners conduct themselves in an orderly manner. A city is not liable for negligence of its officers in exercising its governmental functions. A prison is not a nuisance per se. A city is not liable to an adjoining owner for damages arising from maintenance of a prison, authorized by Kentucky Statute, that being discharge of a governmental duty.—Court of Appeals of Kentucky, 134 S. W. R., 921.

Injuries Incident to Public Improvement.

Board of Council of City of Danville vs. Fox.—A city, in the improvement of its streets, acts in its governmental capacity and is not liable for injuries to one whose horse was frightened by the escape of steam from a steam roller.—Court of Appeals of Kentucky, 134 S. W. R., 883.

Stray Animals—Impounding.

Tutt vs. City of Greenville et al.—Where a city estray ordinance provided that a violation thereof should constitute a misdemeanor, that an animal permitted to roam at large in violation of the ordinance might have been impounded and subjected to any fine imposed against her owner did not relieve him from liability nor did it grant the city authority to subject the animal without giving the owner an opportunity to be heard.—Court of Appeals of Kentucky, 134 S. W. R., 890.

Taxation—True Value of Bank Shares.

Mayor and Common Council of City of Newark vs. Tunis.—In taxing the shares of a national bank the true value which is the basis of the assessment is under ordinary and normal conditions their exchangeable value in the market and not their book or liquidation value. In assessing shares of a national bank the total valuation of all the shares at their true value is to be ascertained, and from this is to be deducted the amount of the assessment on real estate and such other items as the statute permits to be deducted. Each share is assessable upon its pro rata of the balance.—Supreme Court of New Jersey, 78 A. R., 1066.

Appointment of Police Officers.

Keegan vs. Mayor of City of Bayonne et al.—The charter of the city of Bayonne confers upon the Common Council the power to establish, regulate and control a day and night police and to regulate and define their duties and compensation. Under this power an ordinance was adopted establishing and regulating a police department, and later a supplement thereto provided that there might be appointed by the council, upon the nomination of the Mayor, two or more sergeants of police to perform such duties as might be prescribed by the Mayor and approved by the council. Held, that this legislation did not authorize the appointment of more than two sergeants of police. Such an ordinance would permit the Mayor and council, by nomination and appointment, to increase to an indefinite number sergeants of police and it is in effect establishing, regulating and controlling the police force by a method other than by ordinance, as required by the charter.—Supreme Court of New Jersey, 78 A. R., 1053.

Extension of City Limits—Reasonableness

State ex inf. Major, Atty. Gen., vs. Kansas City.—A city may reasonably extend its limits so as to take in contiguous lands, when they are platted and held for sale as town lots whether platted or not if they are held to be sold as town property when they reach a value corresponding with the views of the owner; when they furnish an abode for a densely settled community or represent the actual growth of the town; when they are needed for any proper town purposes or for the extension of needed police regulations, and when such additional territory is valuable by reason of adaptability for prospective town uses; but the limits may not be extended to take in contiguous lands when they are used only for agriculture or are valuable on account of such use, or when they are vacant and do not derive special value by adaptability for city uses. Facts held to sustain the finding of a commissioner in quo warranto proceedings that an ordinance extending the limits of Kansas City from 26.70 square miles to 57.75 square miles, taking in surrounding territory, deriving a large part of its value from its contiguous location to the city, was reasonable.—Supreme Court of Missouri, 134 S. W. R., 1007.

Street Railway—Rights in Use of Highway.

City of Shelbyville, Ky., vs. Glover.—The fiscal court of a county in Kentucky granted to an electric railroad company right of way to construct its line on a pike to the limits of a city. Held that, whether such grant by implication included the right to build a Y at the city limits necessary to the company for the making of a terminal station at that point depended on whether the court in making the grant contemplated the reasonable possibility that such point would constitute the terminus of the road either permanently or temporarily, and that pending final determination of such question, in a suit, it was within the discretion of the court to grant a temporary injunction restraining interference with the construction and use of such Y.—United States Circuit Court of Appeals, 184 F. R., 233.

Bonds—Sufficiency.

City of Summit vs. Coletta et al.—Both obligor and surety on a bond are estopped to deny, for the purpose of avoiding liability thereon, any recited fact therein. An appeal bond not given for an illegal purpose, complying substantially with the statute, voluntarily entered into, will be held binding, although the proceedings, anterior to its execution, may have been irregular.—Supreme Court of New Jersey, 78 A. R., 1047.

Private Sewer—City's Liability for Nuisance

Hines vs. City of Nevada.—A city, with the aid of some of its citizens, constructed a sewer, the terminus of which was near plaintiff's home. An ordinance was passed allowing property owners to connect with the sewers, provided the persons so connecting should hold the city harmless from any damages resulting therefrom and that they would not permit any improper material to be thrown into the sewer nor connect any vault therewith and would keep the inlet properly protected with grating or trap to prevent stench from escaping from the sewer. The city also reserved to itself the right to abate any of the connecting drains on proof that the same had been improperly used and to abate or discontinue the main sewer at any time should it become a nuisance. Held, that such an arrangement was not the grant of a franchise by the city for the construction of a sewer for the exercise of which right the city would not be liable; its reservation of the power of control and regulation rendering it liable for the creation of a nuisance arising from improper use of the sewer.—Supreme Court of Iowa, 130 N. W. R., 181.

Assessment—Review—Appeal

Newton vs. City of Superior et al.—Where landowners took an appeal from the final determination of the City Council in street improvement proceedings, under Laws 1909, and such property owners also commenced actions in equity to set aside the assessment and to restrain the issuance of improvement certificates, but such appeal was not consolidated with the equitable actions, the Supreme Court on appeal from the judgments in the equitable action could not review any matters arising on such appeal to the Circuit Court.—Supreme Court of Wisconsin, 130 N. W. R., 243.

Electric Vehicle for Trimming and Inspecting Arc Lamps

THE trimming of the lamps on the newly erected twin lamp poles in the central section of the city of Philadelphia proved to be quite a problem. After the use of a temporary makeshift design and construction of an electric tower wagon was considered. The main difficulty was to devise a plan to obviate the necessity of having an extra man to do the trimming, as otherwise the driver would be compelled to climb to the top of the tower to trim each pair of lamps. At the suggestion of A. H. Manwaring, engineer of arc lighting of the Philadelphia Electric Company, a tower wagon was designed that could be operated from either the upper platform or the driver's ordinary position at the floor level, and equipped with a turntable at the top to enable the operator to trim the lamps on both the street and house sides of the poles. The Commercial Truck Company, of Philadelphia, collaborated with Mr. Manwaring, and the illustration shows the result of their work.

The tower wagon is constructed on the ordinary 500-pound chassis, the weight of which without the tower and including the battery, is 2,600 pounds. The weight of the tower is 650 pounds, making a total weight of 3,250 pounds. The vehicle is equipped with a 42-cell, 7-plate Philadelphia storage battery, which will furnish an average speed of 15 miles per hour on the level, and has a mileage capacity of 30 miles per charge. The wheels are equipped with 2½-inch by 36-inch Firestone tires, both front and rear. The controller is mounted on the upper platform, and can be operated from either the upper or lower seat by a tube outside the steering shaft. The reversing mechanism is a Z-slot bushing keyed on the controller tube, which is worked from the upper seat by the foot and from the lower seat by the hand. The steering

gear is mounted in the usual manner, and is worked from the upper or lower seat by a shaft which runs through the controller. The brakes can be worked from the lower seat by a foot lever in the usual manner, and from the upper seat by a foot lever rod and bell crank. The upper foot lever has an extension, so that the operator can set the brakes from the top seat, climb down and release the brakes from the lower seat, or vice versa. The electric bell is operated from either the upper or lower seat by a floor push in the toe-board. The platform is 13 feet 6 inches from the ground, and an additional height can be secured by hanging a portable stand from the side rails, which will increase the height to either 14 feet or 15 feet 6 inches, depending on which rail is used.

A test of the stability of the machine was made by suspending a weight of 700 pounds from the end of the platform when turned in the position occupied by the trimmer in trimming the lamps. This test was made before the battery was installed and proved the stability of the tower wagon under the most severe working conditions.

The tower wagon has been giving very satisfactory service, and enables the trimmer to cover each of his routes in approximately six hours, while by the old method nine hours were required to accomplish the same results.

Formerly the inspection of these lamps necessitated the stationing of a horse-drawn wagon and driver at a centrally located point, and also the use of a motor cycle, the operator of which covered the district lighted by the ornamental lamps in about four hours. He reported all faulty lamps to the driver, who would proceed to the various locations with the team and start or change the defective lamps.

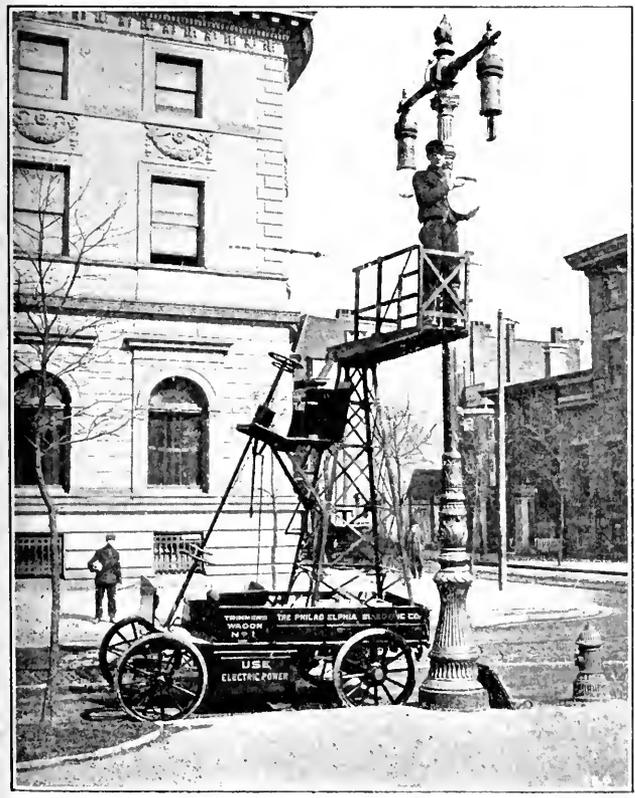

The tower wagon eliminated the necessity for the horse-drawn wagon and motor cycle, as by its use all the lamps on ornamental poles are inspected in approximately two and one-half hours, and faulty lamps started or changed by the operator, who carries a number of lamps for this purpose on the tower wagon.

This new meth-

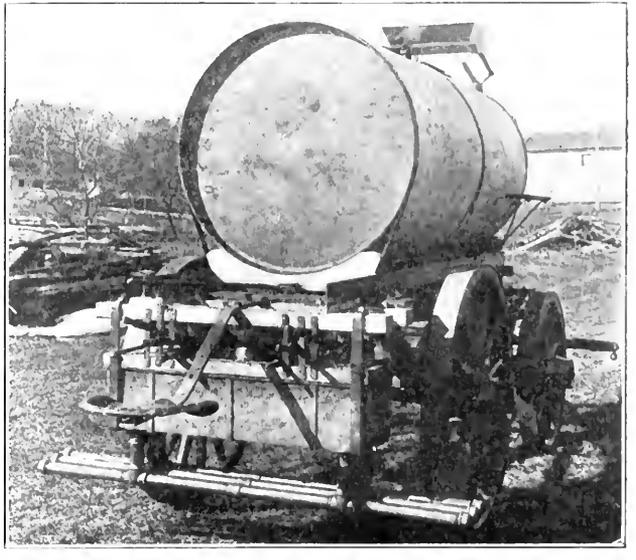

od of trimming and inspecting the ornamental lamps shows a daily saving in the cost of transportation and labor of approximately 33.3 per cent over the former method of using the horse-drawn wagon and motor cycle.

Road Oiler

THE Etnyre improved road oiler, manufactured by E. D. Etnyre & Co., Oregon, Ill., has a very carefully arranged system of controlling the distribution of road oil or tar by means of pipes and valves. The apparatus consists of a cylindrical tank wagon of substantial construction, and a detachable auxiliary tank with levers, valves and pipes. The auxiliary tank is a rectangular steel box of a little less width than that of the wagon track. A large pipe leads from the main tank into the center of the auxiliary tank. The flow of oil is controlled by a simple valve and lever. There are three parallel distributing pipes immediately below the auxiliary tank. Vertical pipes lead from each end of the auxiliary tank into the distributing pipe, so that each distributing pipe is fed from two points. As the distributing pipes are divided in the middle by partitions, the feed is practically in the middle of each half section. Separate levers, six in all, control the flow through the vertical feed pipes into the distribution pipe. It is evident then that in operation either one or two or three feed pipes may be used either on one or both sides. This enables the operator to distribute as much or little oil as is desired, whether it is of a very liquid character or very viscous. The distribution pipes are six feet long, so that a width of three or six feet of roadway may be treated. The use of the auxiliary tank also has the advantage that the pressure of the oil in the discharge pipes is uniform, no matter whether the supply tank is nearly full or empty. The manufacturers state that the distributor can be detached from one wagon and attached to another in two minutes, so that one distributor can be used to distribute oil hauled by two or more wagons. All levers controlling valves are within easy reach of the operator who sits on an iron seat attached. The orifices in the distribution pipes all of different sizes.

TRIMMERS' WAGON FOR ARC LIGHTS

ETNYRE IMPROVED ROAD OILER

MUNICIPAL APPLIANCES

Steel Playground Apparatus

In issuing its catalogue of steel playground apparatus the Fred Medart Manufacturing Company, De Kalb and President streets, St. Louis, Mo., express the wish that its readers might compare the construction of apparatus outlined therein with that which the company offered ten years before. The company says the improvements shown, made gradually from year to year, are the result of a most careful study of the uses and requirements and a desire to furnish the best and most practical construction possible. The apparatus is claimed to be practically indestructible. This result has been accomplished by the elimination of all wooden parts and the substitution of galvanized steel. In order to make the apparatus cheaper to the purchaser the Medart company will furnish apparatus and special fittings, allowing the pipe, of standard sizes, to be purchased in the local market. The special fittings, the use of which the company recommends in all cases, facilitate the setting up of the apparatus because they are not threaded. Complete specifications for the pipe to be purchased in the local market are furnished and ordinary workmen can erect the frames.

The illustration shows one of the Medart standard gymnastic outfits, as well as one of the fittings on a larger scale. This apparatus requires a ground space measuring 46 by 47 feet, and is 14 feet high. The apparatus weighs 4,400 pounds, the special fittings 300 pounds and the pipe for the outfit 390 pounds. It consists of four incline ladders, two incline poles, two long slides, four guard rails, four teeter ladders, four swinging climbing poles, two flexible ladders, five traveling rings, four pairs of flying rings and three horizontal bars. The fitting illustrated is a triple brace fitting connecting a 3-inch horizontal pipe, a 3-inch vertical pipe and two 2-inch pipe braces. The company makes a ball bearing swinging fitting, used for attaching swings, flying rings, traveling rings, etc., to 3-inch pipe frames, which is the most important of any of the fittings used in playgrounds, as it has to stand constant wear. The ball bearing feature affords an easy movement, overcomes squeaking and wears almost indefinitely.

The incline ladder included in the

outfit illustrated is 20 feet long. It is intended to be put into the ground to a depth of 2 feet, and brought out 12 feet from the frame on the ground. This gives the ladder an angle of nearly 45 degrees. Each side is made of a piece of 2-inch galvanized pipe. The rungs are made of 3/4-inch galvanized pipe. The rungs are let into the pipes which form the sides and are riveted through. The long slide is built so that it can be used by older boys and girls, though originally intended for the use of small children. It is 30 feet long and is covered with galvanized sheet steel. The sides are made of polished rock maple. It is shaped so that the speed will be checked just before reaching the ground.

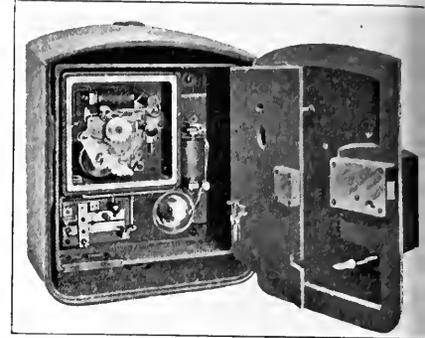

Hose Nozzle for Street Flushing

S. F. HAYWARD & Co., 39 Park place, New York City, manufacture an attachment for a Callahan shut-off nozzle which is used by the New York Street Cleaning Department for flushing streets. The nozzle is the regular Callahan device with 2 1/2-inch thread to connect direct to a hose coupling. A special attachment is made to take the place of the ordinary screw tip. This is a single piece of brass cast with a fan shaped end having a flat stream outlet about 3 1/2 inches long by about 3-16 inch wide. In using this street cleaning nozzle the man holding the hose directs the stream on the pavement at a distance of about 10 or 15 feet in front of him and moves forward as the street is cleaned. A paper by a board of consulting engineers reporting a year or more ago on street cleaning methods made a comparison of the efficiency of the flat and the ordinary nozzle. It was stated that by the use of the special nozzle 40 per cent less water would be used and 25 per cent more surface cleaned.

Fire Alarm Street Box

THE Metropolitan fire alarm street box shown in the illustration, made by the Star Electric Company, Binghamton, N. Y., is equipped with a simple, substantial and reliable mechanism, including local and distance non-interfering mechanism, instantaneous circuit controller, lightning-proof insulating protector, silent test attachment and other proprietary features.

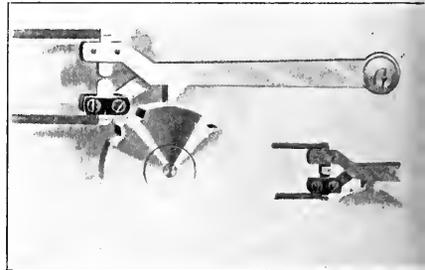

The instantaneous acting circuit controller, also illustrated, is claimed to be one of the most marked improvements in fire alarm boxes made during the past decade, as it is the only circuit controller or breaker used in any fire alarm box upon the market which has an instantaneous action in both opening and closing the circuit. At the same time it provides, at the instant of open-

STAR METROPOLITAN FIRE BOX

ing the line, a gap large enough to break an electric current of 100 or 200 times the energy intended to be on fire alarm circuits. As there is no electrical connection between the controller arms and the signal wheel, dirt on the signal wheel can have no effect upon the transmission of an alarm, and as there is a blade upon the lower arm working in a jaw in the upper arm no dirt can prevent a good contact.

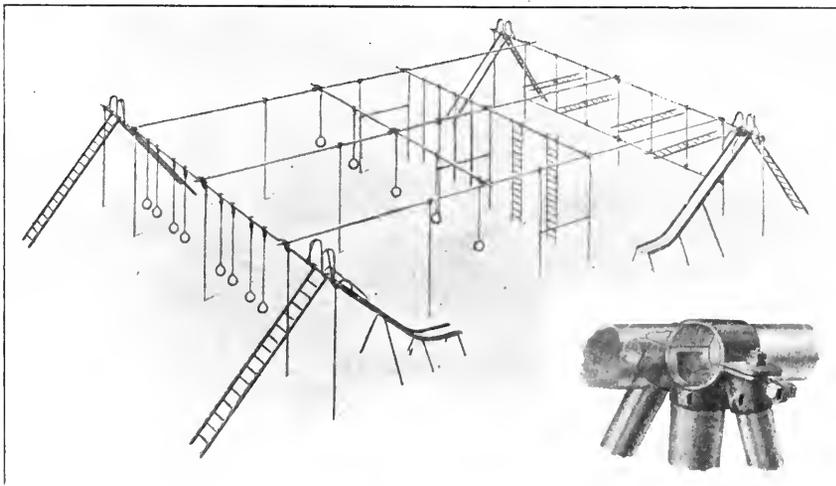

The contact blade and jaw are of hard rolled silver, which is not only of highest electrical conductivity, but ex-

STAR CIRCUIT CONTROLLER

posure to the atmosphere or even to gases destructive to other metals only turns it black, which hardly makes an appreciable change in its electrical resistance, while instead of having a separate contact or tooth for each stroke of an alarm, the fact that the contact is always made and broken in the same place assures the greatest accuracy and reliability. Any tendency toward welding from strong currents will be overcome by an ingeniously arranged separating pin, which by the running of the clockwork breaks the circuit and allows the alarm to proceed.

The action of this controller provides a path for the line current of maximum capacity at the instant of closure and maintains full contact for a uniform interval, as compared with the variable action of brushes, pens, etc., thus preventing the confusing "double blow" occasionally encountered in use of other type of boxes and permitting the use of a short, concise closure of the circuit, resulting in maximum efficiency of the non-interference of all other boxes in circuit with it, regardless of their style of non-interference.

MEDART ALL STEEL GYMNASTIC APPARATUS FOR PLAYGROUNDS

NEWS OF THE SOCIETIES

American Association for Highway Improvement.—Some of the associations which have already joined this national body are: The International League for Highway Improvement, of New York, whose president is John A. Stewart; the Southern Appalachian Good Roads Association, whose secretary is Dr. Joseph Hyde Pratt; the North Carolina Good Roads Association, whose president is Dr. Pratt; the South Carolina Good Roads Association, whose president is F. H. Hyatt, of Columbia, S. C.; the Ohio Good Roads Federation, whose president is Archibald Huston; the Arkansas Good Roads and Drainage Association, whose president is Judge Joseph Asher; the Gulf Coast Good Roads Association, J. H. Hawley, secretary; the New Santa Fé Trail Association, R. F. Faxon, president, Garden City, Kan.; the Montana Society of Engineers, and the Capital Highway Association of Pinehurst, N. C., Leonard Tufts, president. While the American Association for Highway Improvement will not supplant any of the existing organizations, it will be of great use to all its associate members. The association is nationalizing the movement having in view the improvement of public roads. In aid of all such enterprises, the Washington association will, as its facilities develop, provide well-informed and thoroughly capable lecturers, writers and organizers, and will not restrict its efforts in this direction to the attainment of a salaried staff of assistants, but is even now obtaining the gratuitous aid of men conspicuous for their success in all walks of life and who are willing to aid the national movement for good roads from the standpoint of broad minded patriotism. As an example, if any of the organizations which have become associate members are struggling with a problem of how best to provide a suitable system of improved roads, the association will endeavor to have representatives from some other county that is successfully solving the same problem give their aid to the movement by addressing public meetings or by writing an explanation of their work. As the State and local associations come into the American Association for Highway Improvement they will find that their strength will be increased one hundred fold. The policy of the association will be to throw its strength just when and where it is needed. This will guarantee results. If any other assurance of success for the new nationalizing movement were needed it would be furnished by the list of officers of the American Association for Highway Improvement, including L. W. Page, director of the United States Office of Public Roads, as president; W. C. Brown, president of the New York Central, as vice-president; Lee McClung, Treasurer of the United States, as treasurer, and Louis Hill, president of the Great Northern Railroad Company, as chairman of the board of directors. The President of the United States, William Howard Taft, has become a regular member of the association.

Municipal Art Society, Hartford, Conn.—The total attendance at the municipal exhibit under the auspices of the Municipal Art Society and the Civic Club during the two weeks in which it was opened was 14,762.

Conference of Sanitary Officers of New York State.—Announcement is made by the State Board of Health of a Central New York conference of sanitary officers to be held in Syracuse on May 2 and 3. Health Officer D. M. Totman estimates that there were 35 health officers in Onondaga County and that there would probably be an attendance of 100 more from adjacent counties at the meeting. Instead of a programme of papers there will be a clinical presentation of subjects. The first day's sessions will probably be held in the city laboratory at the City Hall. The programme of the evening will be a discussion and answers to questions which may be placed in a question box. The officials will go to Skaneateles Lake on May 3 to inspect some parts of the water supply and the village sewage disposal plant. This trip will be made after the health officers have done some field work in the way of looking over some of the nearby dairies. On their return to the city, if there is time available, they will inspect the new intercepting sewer work.

Playgrounds Institute of North Central States.—The first playgrounds meeting to be held in the Northwest was called to order at the Radisson Hotel, Minneapolis, April 6. E. B. De Groot, Chicago Playgrounds Commissioner, made an address describing the Chicago playgrounds. Edward J. Ward, adviser of the department of civic and social development, University of Wisconsin, spoke of "Civic and Social Centers in Public School Buildings." Prof. Carl Rothpress, of the St. Paul Y. M. C. A., talked on "What to Do in Winter." Miss Lilla Louise Wood, director of the Minneapolis Kindergarten Normal School, spoke on "Playground Activities for Children Under Ten Years of Age." Mrs. Harriett Heller, University of Nebraska, spoke on "Activities for Older Girls." Leo F. Hamner gave a description of the playground work in the various cities of the country. D. Lange, St. Paul, spoke on "Boy Scout Patrols on the Playgrounds."

Engineers' Society of Pennsylvania.—The seventh anniversary was celebrated in the rooms of the society in the Gilbert Building, Harrisburg, Pa., March 31. President David E. Tracy acted as toastmaster and made the principal address, which was followed by addresses by former presidents, who reviewed briefly the events of their presidency. They are as follows: W. B. McCaleb, president in 1906, and the only member of the original society present last night; G. W. Parsons, president in 1905; F. Herbert Snow, president in 1909. William C. Cuntz, a former member, now located in New York, was present and made a short address by special request. Colonel H. C. Demming also spoke briefly. The history of the society was read by the secretary, E. R. Dasher, after which refreshments were served to the guests. The Engineers' Society at its organization had an enrollment of 200 members, but in the seven years of its existence this number has been increased to 800. It is conducting elaborate courses of lectures, maintains a valuable library, is publishing monthly a journal of proceedings, which has reached an exceptionally high place in this class of publications, conducts extensive excursions to examine objects of engineering interest and is taking a very active part in the welfare of Pennsylvania engineers.

Congress of Technology.—The Congress of Technology, which met in Boston on April 10 and 11 in celebration of the semi-centennial of the signing of the charter of the Massachusetts Institute of Technology, was a pronounced success on the two main lines laid out by its projectors. The Congress opened on the afternoon of April 10 with an address by President MacLaurin, of the Institute, on "Some Factors in the Institute's Success." The greatest of these, he said, was the method of teaching due to William Barton Rogers, the founder of the Institute, and now phrased as "the learning by doing."

The second day of the Congress was given over to the presentation of papers on various aspects of applied science. These papers were grouped in six divisions, so arranged that the large numbers of the outside public which attended all the sessions were able to hear papers on the topics in which they were especially interested.

The Congress came to its climax with the banquet in Symphony Hall on the evening of April 11, when the enthusiasm of the thousand of institute alumni and their guests who filled the floor of the hall was a sort of summary of the impressions made by the two days' proceedings. The papers presented at the public session gave to the audiences an extraordinarily adequate idea of how completely applied science shapes and controls the living conditions of the present. And as all the papers were by alumni or members of the faculty of the institute it was also made clear how large a part the institute had played in creating the applied science of today.

These two ideas were expressed along with the third idea more immediately practical at the great banquet. It has been clear for some time that the future development of the Institute of Technology is hampered by the lack of adequate endowments and buildings. The feeling that the beginning of the next half a century of the institute ought soon to see a new Technology, carrying on the standards of the past with greater facilities, was the dominant note in all the speeches at the banquet. The alumni are eager to do their full share toward making this new Technology a reality. Their earnestness was shown by President MacLaurin's announcement at the banquet that alumni have already definitely pledged themselves to give a very large part of the price necessary for buying a new site for the institute and that Edward N. Hagar, Tech. '03, president of the Universal Portland Cement Co., has promised as a gift all the cement needed for erecting the new buildings in reinforced concrete. Meanwhile the question of the site itself, Dr. MacLaurin said, had been narrowed to a choice between three sites, all of which are within a short distance of the present buildings. It is expected that this question of a new site, upon which everything else in the development of the institute depends, will very soon be settled.

Brooklyn Engineers' Club.—An exhibit of engineering materials, models and plans of engineering machinery, together with photographs and drawings of important engineering structures, is being held at the clubhouse, 117 Remsen street, during the current week. The exhibits include a variety of subjects, from a model of a refuse destructor plant to one showing the complete working of a modern fire alarm system.

Calendar of Meetings

- April 27-28.
Good Roads Association of Florida.—
Annual Meeting, Tallahassee, C. L.
Bittinger, Secretary, Ocala, Fla.
- May 11.
Massachusetts Highway Association.—
Quarterly Meeting in conjunction with
the New England Conference on Street
Cleaning, Springfield, Mass.
- May 15-17.
National Conference on City Planning.
—Philadelphia, Pa.—Flavel Shurtleiff, Sec-
retary, 19 Congress street, Boston, Mass.
- May 18-19.
Ohio Society of Mechanical Steam and
Electrical Engineers.—Annual Con-
vention, Youngstown.—F. E. Sanborn, Sec-
retary, Ohio State University, Columbus.
- May 23-25.
National Fire Protection Association.—
Annual Meeting, New York City.—F. H.
Wentworth, Secretary, 87 Milk St., Bos-
ton.
- May 23-26.
National Good Roads Association.—
Fourth National Good Roads Congress,
Birmingham, Ala.—J. A. Rountree, Sec-
retary, Birmingham, Ala.
- May 25-26.
League of Second and Third Class
Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2.
National Electric Light Association.—
New York City.—T. C. Martin, Secretary,
31 West 39th St.
- June 5-14.
National Probation Officers' Association.
—Boston, Mass.—Roger N. Baldwin,
Secretary, 903 Security Building, St.
Louis, Mo.
- June 6-10.
American Water Works Association.—
Thirty-first Annual Convention, Powers
Hotel, Rochester, N. Y.—John M. Diven,
Secretary, 14 George street, Charleston,
S. C.
- June 7-14.
National Conference of Charities and
Correction.—Boston, Mass.—Alexander
Johnson, Secretary, Ft. Wayne, Ind.
- June 7.
National Association for the Study and
Prevention of Tuberculosis.—Denver, Col.
—Dr. Livingston Farrand, Executive Sec-
retary, 105 East Twenty-second street,
New York City.
- June.
New England Conference on Street
Cleaning.—Springfield, Mass.—Corre-
sponding Officer, Carol Aronovici, 55 Ed-
dy street, Providence, R. I.
- June 11-16.
International Association of Chiefs of
Police.—Eighteenth Annual Convention,
Rochester, N. Y.—Major Richard Syl-
vester, Superintendent of Police, Wash-
ington, D. C., President.
- June 13-18.
New York State Association of Chiefs
of Police.—Annual Convention, Roches-
ter, N. Y.
- June 13-16.
American Society of Civil Engineers.—
Annual Convention, Chattanooga, Ten-
nessee.—Charles Warren Hunt, Secretary,
220 West 57th St., New York.
- June 21-22.
National Conference of Poor Law Offi-
cials.—Boston, Mass.—Dr. Robert W.
Hill, President State Board of Charities,
105 East Twenty-second street, New
York City.
- August 15-18.
Firemen's Association of the State of
New York.—Watertown, N. Y.—A. H.
Otto, Secretary.
- September 19-22.
International Association of Fire Engi-
neers.—Annual Convention, Racine, Wis.
- September 19-22.
American Hospital Association.—New
York City. J. N. E. Brown, M.D., Sec-
retary, Toronto General Hospital, Can.
- September 24-30.
International Congress on Tuberculosis.
—Rome, Italy.—Professor Ascoli, Sec-
retary-General, Via Lucina, Rome, Italy.
- September 26-29.
American Society of Municipal Improve-
ments.—Grand Rapids, Mich.—A. Pres-
cott Folwell, Secretary, 239 West Thirty-
ninth street, New York City.
- October 4-6.
League of American Municipalities.—
Annual Convention, Atlanta, Ga.—John
MacVicar, Secretary, Des Moines, Ia.

PERSONALS

CAUL, REV. A. W., newly elected Mayor of Vinton, Iowa, was inducted into office last week following the session of the last year's council to close the business of the fiscal year. A clean sweep of appointments was made by the new Mayor. COOK, THEODORE F., has been re-elected superintendent of the municipal water and light plants of Dover, Del. DUNCAN, REV. L. J., a Unitarian minister, was elected Mayor of Butte, Mont., on the Socialist ticket. Mr. Duncan was elected by the largest plurality ever given a Mayor there. FREEMAN, J. M., was re-elected Mayor of Paris, Tenn. GASS, OTTO, former assistant to City Engineer Rudolph, of Manitowoc, has been officially named as city engineer at Two Rivers, Wis. GILMORE, W. A., a former Seattle attorney, has been elected Mayor of Nome, Alaska. GRICE, DR. JOSEPH, has been elected City Bacteriologist of Providence, R. I. LAMBERT, CHARLES S., has been elected Mayor of East St. Louis, Ill. MCINTOSH, HERBERT M., has been reappointed City Engineer of Burlington, Vt. MENTON, JOHN A. C., who was a professional pugilist 15 years ago, has taken the oath of office as Mayor of Flint, Mich., and assumed the reins of the first Socialist municipal administration ever elected in the State of Michigan. MORLEY, ALFRED J., has been elected Mayor of Victoria, B. C. PHELPS, H. H., has been elected President of the Board of Water and Light Commissioners of Duluth, Minn. STEINMETZ, DR. CHAS. P., the distinguished electrical engineer, recently gave a talk in Schenectady on "The Prosperity of Schenectady," in which he pointed out the defects of the city and suggested improvements. TILLSON, GEO. W., Chief Engineer of the Department of Highways in Manhattan, has been appointed by Pres. Steers Consulting Engineer of the Borough of Brooklyn. The position was made vacant by the resignation of R. W. Kreuzbauer. WILSON, MRS. ELLA, has been elected Mayor of Hunnewell, Kansas. She has the distinction of being the first woman Mayor in the United States. It is stated that Mrs. Wilson will appoint Mrs. Rosa Osborne, defeated candidate for Police Judge, to the office of Chief of Police.

MAJORITY ELECTIONS.

IDAHO.

Boise—Harry Fritchman.
Sandpoint—Dr. Chas. S. Moody.
Moscow—Dr. J. N. Clarke.
Genesee—E. E. Dyer.
Wardner—D. W. Peeples.
Harrison—A. A. Crane.
Greenville—W. W. Brown.
Hailey—S. M. Friedman.
Payette—H. J. Brannock.

OKLAHOMA.

El. Reno—P. P. Duffy.
Mangum—B. L. Tisinger.
Altus—J. C. Kirby.
Blackwell—N. D. Kisler.
Anadarko—W. M. Plum.
Hugo—R. J. Jones.
Sulphur—D. J. Kendall.
Wilburton—R. A. Morris.
Ponca City—F. E. Sparks.
Chickasha—J. B. Burton.
Ardmore—E. H. Dawson.
Wagoner—J. C. Cook.
Muskogee—D. H. Middleton.
Sayre—W. P. Fisher.
Enid—Peter Bowers.
Poteau—C. D. Hill.
Cherokee—A. J. Titus.

TRADE NOTES

Cast Iron Pipe.—Chicago: Indications are that this will be a satisfactory year in the pipe industry. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 1 inch and up, \$24. Birmingham: Prices are firm. Stocks of seconds suitable for culvert work have been exhausted. Quotations: 4 to 6-inch, \$23; 8 to 12-inch, \$22; over 12-inch, average \$21. New York: Public lettings are much below the average for the season, but private buying is about normal. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—Market is dull but firm. Quotations: New York, 4.45c; St. Louis, 4.30c.

Rubber Tires.—The Firestone Tire and Rubber Company has published in pamphlet form a paper read by Dan C. Swander before the Electric Vehicle Association. The author reviews the history of the use of rubber and of rubber tires and then takes up the subject of the required qualities of a rubber tire. He explains the advantages and disadvantages of softness and hardness in a rubber tire and states that the ideal combination of qualities makes the most expensive tire to manufacture. The more recent improvements in the construction of tires and rims are explained, special reference being made to the Firestone manufactures.

Asphalt Mastic Floors.—The American Asphaltum and Rubber Company, 600 Harvester Building, Chicago, Ill., has published a pamphlet describing the merits of its mastic floors and illustrates some of the large plants where they have been laid. Sanitation, comfort and economy are the merits of this material. It is sanitary because it will not absorb liquids like wood and will not crack or chip like cement. It is economical in first cost because only one inch thick and in maintenance because if it should have to be relaid the old material can be heated, new asphalt added and the mixture relaid.

Wooden Paving Blocks.—Acting on a recommendation of City Engineer Shipley, Cincinnati, O., Service Director Sundmaker has instructed that official to draw up a supplementary contract with Warren Brothers, contractors for the Clifton avenue improvement, to complete the paving of Clifton avenue, between McMillan street and Ludlow avenue, with wood block of the Southern Wood Preserving Company, of Atlanta, Ga. There is still some 5,000 square yards to be paved in Clifton avenue, and the supplementary contract will provide a reduction of 20 cents a yard, this being the difference in price secured by Warren Brothers from the Southern company from the price paid by them for the block under the old specifications. The contract price is \$2.50 a yard, and in the supplementary contract this will be reduced to \$2.30 a yard. Warren Brothers were given permission by Director Sundmaker some time ago to seek wood block elsewhere under the new specifications, though the contract had been let under the old specifications, which, it was alleged, confined the wood block permitted to the product of one company. They reported to Engineer Shipley that they could secure block up to the new specifications from the Southern company at 20 cents a yard less than that paid for the block under the old specifications. Samples of the block and oil were tested by City Chemist Wehmer and found to be in accordance with the new requirements.

Earth Excavation.—The Barron & Cole Company, 127 Franklin street, New York, N. Y., has issued a folder having several illustrations of the Maney scraper, by the use of which it is stated earth can be moved for 4 cents per cubic yard.

Seamless Steel Barrels.—The Pressed Steel Tank Company, Milwaukee, Wis., manufactures a patented seamless steel barrel. The barrel has the bilged body and integral head formed from a single piece of open hearth steel shaped by a hydraulic press. The barrel is suitable for the safe transportation of gasoline and for other purposes.

Pipe Works Burned.—Fire seriously damaged the south pipe foundry of the Camden Iron Works, R. D. Wood & Co., Camden, N. J., April 6. The roof was burned through, but did not fall, thereby saving what might have been a heavy loss from damaged machinery and equipment. This department will be idle several weeks for repairs, but a good share of the work will be taken care of in other departments of the plant. The loss is estimated at \$15,000.

New Asphalt Pavement.—The Neuchatel Asphalt Company, 265 Broadway, New York City, has just completed the construction of a practically new form of roadway pavement on Thomas street from Broadway to Church street, New York. This pavement consists of what is known as compressed rock asphalt slabs, laid upon a concrete base, finished on top with a thin "rubber" coating of pure rock asphalt richer in bitumen. These slabs are composed of natural rock asphalt obtained from the mines of the Neuchatel Asphalt Co., Ltd., at Travers, in the Canton of Neuchatel, Switzerland. The rock, after being mined, is ground to powder, which, after having been properly heated, as in the case of ordinary compressed asphalt, is compressed in special moulds under a hydraulic pressure of 3,000 pounds to the square inch. These slabs when laid are about 10 inches square and 1 3/4 inches in thickness, and are laid upon a concrete base 4 to 5 inches in thickness, with a cushion of cement and sand mixed dry, of just sufficient thickness (about one-quarter of an inch) to level up any inequalities of the concrete base, so as to afford a firm and level bed for the slabs. The slabs are laid with the joints as close as possible, in exactly the same manner as tile on a tile floor. When all the slabs are laid and leveled the entire surface is sprinkled with water from a sprinkling can, so that sufficient moisture may penetrate through the joints to enable the cement underneath to set up. After this the entire surface of the slabs is covered with a thin coating, not more than one-quarter of an inch in thickness, of rock asphalt mastic, heated in kettles and spread over the surface with a wooden float in the same manner as an ordinary rock asphalt sidewalk or floor, and dusted over with a light coating of dry cement, lightly brushed in with a broom. This forms what is called the "rubber" coating, so called from the "rubbery" nature of the wearing surface thereby obtained. On account of this rubbery character, the surface affords, it is claimed, a sure foothold for horses, as their shoes indent the surface sufficiently to prevent any slipping whatever while turning or backing in cold weather or when the surface is wet or covered with snow. The rubber coating is intended to be renewed from time to time as necessary, so that there is no direct wear on the asphalt slabs.

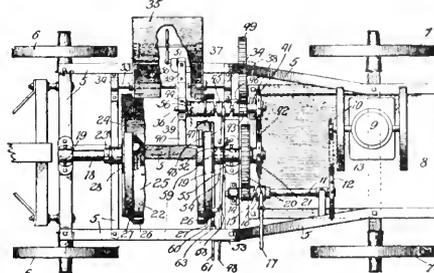

PATENT CLAIMS

987,726. PROCESS FOR MAKING ROADS, PAVEMENTS, ETC. Jules Lassailly, Issy-les-Moulineaux, France. Serial No. 476,953.

The method of making roads, paths, sidewalks, etc., which consists in mixing calcareous-clayey sand 80 per cent and dry coal-tar pitch 20 per cent, then spreading the mixture upon a base, then adding a solvent and turning said mixture into a soft pitch and a bituminous cement.

937,974. CONCRETE-MIXER. Andrew J. Fisher, Buda, Ill., assignor to Louis H. Scott, Princeton, Ill. Serial No. 501,610.

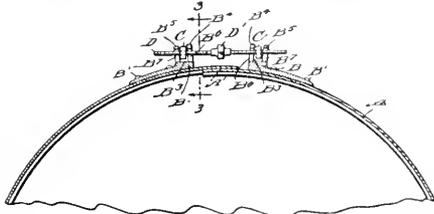

In a portable concrete mixer, the combination with a frame, of a rotary shaft journaled to extend lengthwise of the frame, means for rotating the shaft, a mixing-shell rotatably suspended on the shaft provided with a receiving and discharging opening, a lug on said shell, a second shaft provided with a drum and pinion, disposed in a parallel plane to said first-named shaft and geared thereto, a slidable clutch on said second shaft interposed between the drum and pinion, an operating lever connected with the clutch and adapted to shift

it into and out of engagement with either the drum or pinion, a chain secured at its ends to said drum and shell, adapted to turn the shell upon rotation of the drum for dumping its contents, a bell-crank pivoted to said frame with one of its arms connected with the operating lever and with its free arm in the path of movement of said lug, operating to disengage said clutch from the drum upon turning of the shell to dump the contents thereof, and means connected with said pinion to be actuated thereby for charging materials to be mixed into the shell, for the purpose set forth.

988,109. CULVERT. Adolph Henry Kaufmann, Guthrie, Okla. Serial No. 570,544.

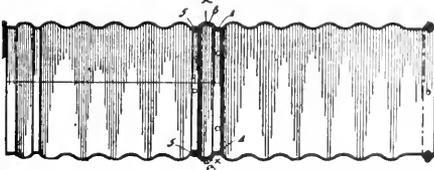

The combination of a split culvert section, blocks on opposite sides of the joint thereof and having body portions recessed in their outer sides and having said recesses non-circular and having the inner and outer walls of the recesses provided with slots for the passage of an operating screw, nuts fitting in said recesses and

conforming thereto whereby they are held from turning and having their threaded openings in alignment with the inner and outer slots in the walls of the recesses and a right and left screw having a central head portion and having the laterally extending threaded portions operating in their respective nuts and extending through the slots in the inner and outer walls of the recesses receiving said nuts, substantially as set forth.

989,343. CORRUGATED CULVERT. Ferdinand J. Feldt, Peoria, Ill. Serial No. 579,414.

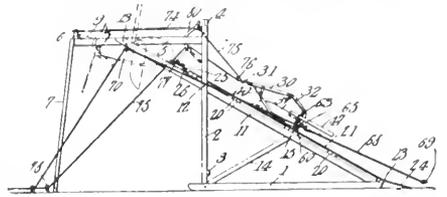

In corrugated metal culvert sections means for uniting them, comprising matching terminal portions of each formed with

perforated flat bearing surfaces, and a circumferential corrugation, intervening between the flat surfaces and rivets or the like for uniting the parts substantially, as shown.

989,263. GRAVEL LOADER AND EXCAVATOR. Fred Hollowell, Orleans, Ind. Serial No. 561,575.

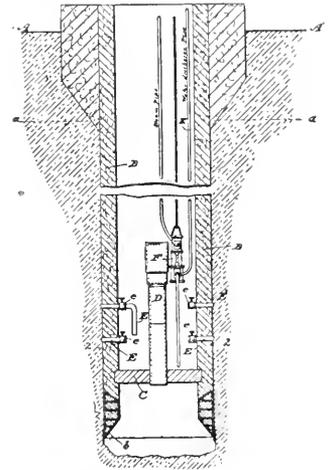

An excavator and loader having an incline, a track beginning at the upper end of said incline and extending away therefrom, a traveler movable on said track and

having a pulley connected therewith, and a cable extending over said pulley and adapted to be connected with draft power, and a conveyor movable on said incline and connected with said cable.

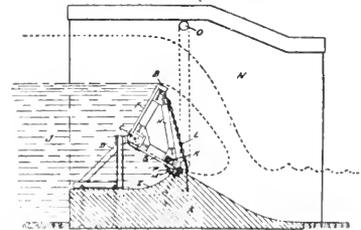

989,110. SINKING DEEP SHAFTS IN WATER-IMPREGNATED GROUND. Frank Billings, Cleveland, Ohio. Serial No. 578,314.

The herein described process of sinking shafts through water-impregnated ground which consists in lowering into the excavation as it is deepened a shaft having an air caisson at its lower end, in draining water from the surrounding ground into said shaft through ports in the walls thereof above said caisson, and in pumping said water from the shaft.

989,079. MOVABLE CREST FOR DAMS. George F. Stickney, Albany, N. Y. Serial No. 590,169.

In a device for increasing the head at dams, the combination of a stationary substructure; a movable crest, comprising two connecting leaves placed at an angle to each other; a means for tying said leaves rigidly in position relative to each other; a

means for relatively supporting said crest above said stationary substructure; a means for limiting the movement of said crest; and a means placed in contact with said substructure and one of the leaves of the crest for decreasing the leakage between the leaf of the crest and the substructure.

987,597. COMPOSITION OF MATTER FOR USE IN MAKING ROADS AND PROCESS OF MAKING SAID COMPOSITION. Edward A. Paterson, Port Arthur, Ontario, Canada. Serial No. 567,959.

The process of producing a solution for use in making roads, consisting in dissolving lime in the absence of carbon dioxide in a hot solution of sugar to produce sucrate of lime, and then mixing a diluted solution of the sucrate of lime in suitable proportion with an alkaline silicate.

BOOK NOTICE

Digest of Short Ballot Charters. Edited by Chas. A. Beard, Ph.D. Quarto. 130 pages. New York, The Short Ballot Organization. \$5.00.

This book is out of the ordinary in several respects, one of them being that it is not permanently bound, but is in the loose-leaf form, contained in substantial cloth covers, which have a capacity for more than double the number of pages as present furnished. In order to conveniently permit of additions not only at the end of the present matter, but intermediately throughout the work, the book is page after the decimal system employed in library indexing, the first page being 10.00 and the last page 91.101; the idea apparently being to allot 100 pages to each of the minor subdivisions of the matter. The work is further described in the sub-title as being "A documentary history of the commission form of municipal government." The editor is associate professor of politics in Columbia University, and he has been assisted in the work by the office of the secretary of the Short Ballot Organization.

The work opens with a definition of the "short ballot charter," a portion of which was quoted by us in our article in the February 22nd issue. Next comes a list of short ballot cities corrected to March 15, 1911, but which it is proposed to add from time to time, it being proposed to furnish new leaves to replace the one printed with this edition. There is then given a list of quasi short ballot cities. Following this are articles treating of municipal government and written by President Eliot; Richard S. Childs, secretary of the Short Ballot Organization; Robt. Tyson, of the American Proportional Representative League; John MacVicar, Commissioner of Des Moines, and Elliot H. Goodwin, secretary of the National Civic Service Reform League. The next section discusses the elements and factors of commission government, followed by outlines of short ballot charters of all the cities and states which have provided for commission government. The next part gives in tabular form various items of information concerning all of the commission-governed cities, such as population, number of commissioners, salary, etc. Following this are the charters in full of a great many of the cities. The editor has obtained from special correspondents reports concerning the operation of commission government in several of the cities, it being presumed that these are impartial and unbiased reports from actual observation and investigation. In the report upon Houston appears a statement which, although it is by no means new, seems to us to be worth being restated and generally born in mind: "Now, the question that will occur is, 'What did the commission form have to do with all this?' Save that the commission form gives the power to a powerful man who is powerful for the right, it had nothing to do with it. A powerful man, powerful for the wrong, could, under the commission form, go just as far in the opposite direction." It is for this reason that the recall seems to us to be a desirable part of commission government, so that if the wrong man should be elected he could be removed quickly as soon as his undesirable character shows itself. The work closes with a bibliography of books and articles dealing with city government generally, commission government, the government of individual cities and special phases of city government. There is also an appendix of a few pages giving miscellaneous documents, the only two so far contained therein being the charter of Boston, Mass., and the constitution of Oklahoma. The publishers announce that they will send, as soon as they can be published, an additional article on Franchises by Mr. Delos Wilcox and letters from special correspondents concerning commission government in six or more additional cities.

We believe that this work, although it is confessedly presented as incomplete—in fact, the editor would probably say that it never can be complete until municipal government has ceased to exist—probably contains a greater amount of reliable data and information concerning commission government than any other publication which has yet appeared.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Michigan	Morenci	Apr. 21, 1 p.m.	Paving various streets with brick	C. R. Kellogg, Village Clerk.
Utah	Salt Lake City	Apr. 21	Curbing and pav. in Pav. Exten. No. 64, 6th S. South St.	H. G. McMillan, Chm. Bd. Pub. Wks.
Ohio	Cincinnati	Apr. 21, noon	Improving various streets by grading, setting cement combined curb and gutter, paving roadway with brick or macadam and constructing drains and inlets	John J. Wenner, Clk. Bd. P. Serv. W. P. Chandler, Recorder. Fred W. Toan, Aud. Wood County. Cuno H. Rudolph, Comr. G. S. Barber, Chm. Bd. Road Comrs.
Tennessee	Knoxville	Apr. 21, noon	Paving, curbing, guttering and grading various streets	Capt. Wm. D. Davis, C. Q. M. U. S. A.
Ohio	Bowling Green	Apr. 21, 1 p.m.	Constructing county road 2 miles long	Fred H. Gates, City Clerk.
Dist. of Col.	Washington	Apr. 22, 2 p.m.	Making repairs to asphalt pavements for period end. June 30, 1911	City Clerk.
Michigan	Bessemer	Apr. 22, noon	Grading about 11 1/2 miles of county road, Gogebic County	Wm. B. Lippincott, Chm. Twp. Com. Edgar Koehl, City Clerk.
New York	Plattsburg Bar'k.	Apr. 23, 10 a.m.	Constructing 154 sq. yds. of concrete walk; and installing window and door screens in two buildings	S. Percy Hooker, Chm. St. Hwy. Com. C. L. Allen, County Auditor.
Pennsylvania	Wilkes Barre	Apr. 24, noon	Grading, curbing and paving portions of various streets with sheet asphalt, vitrified brick or wooden blocks	Frank Agnew, Secy. Bd. Co. Comrs. Fred Cary, City Clk.
Kentucky	Maysville	Apr. 24	Paving with Tarvia with macadam base various streets	
New Jersey	Moorestown	Apr. 24	Constructing macadam road on Central ave. & No. Church rd.	
Ohio	Ashland	Apr. 24	Grading and paving with brick Diamond Alley	
New York	Albany	Apr. 24, 26, 28	Constructing various State highways	
Ohio	Marion	Apr. 24	Constructing about 7 miles of macadam road	
Ohio	Youngstown	Apr. 24, 1:30 p.m.	Improv with slag and limestone mac. var. rds. in Mahoning Co.	
Minnesota	Little Falls	Apr. 24, 8 p.m.	Paving with creosoted wood blocks the Broadway wagon bridge	
Ohio	Cincinnati	Apr. 25, noon	Grading, curbing, paving with brick and constructing drains and inlets in portion of Lischer ave.; and furn. crushed stone and stone chips	John J. Wenner, Clk. Bd. Pub. Serv. Bascom Sykes, City Engineer. W. D. Hall, Sec'y Bd. Local Imp. Gail L. Barnard, County Engr. Stanley Struble, Pres. Bd. Co. Comrs.
Virginia	Portsmouth	Apr. 25, 8 p.m.	Paving County and Glasgow streets and the Air Line Turnpike	W. E. Morgan, Clk. Village Council. City Clerk.
Illinois	Harvard	Apr. 26	Const. 12,560 sq. yds. vitr. brick pvmnt. on 5-in. conc. found.	Bert J. Shelton, Aud. Union Co. Bert J. Shelton, County Audr.
Florida	Jacksonville	Apr. 28, 10 a.m.	Resurfacing St. Johns ave. about 27,000 sq. yds. with as. mac.	Commissioners Portage County. D. V. Moffett, Aud. Putnam Co. Nicholas Volz, Aud. Ripley County.
Ohio	Cincinnati	Apr. 28, noon	Improving the Eight Mile road in Anderson township	David H. Moffit, Aud. Warren Co. S. Percy Hooker, Chm. Hwy. Com.
Ohio	Geneva	Apr. 28, noon	Improving streets by grading, draining, curbing and paving with brick on concrete foundation and laying storm sewers	Nicholas Valtz, County Audr. County Comrs.
Pennsylvania	York	Apr. 29	Lay. about 4,000 ft. conc. curbing and guttering at Penn Park	Commissioners Public Works. City Clerk.
Ohio	Marysville	Apr. 29	Improving county roads, Harris and Union townships	
Ohio	Marysville	Apr. 29	Constructing 2 1/2 miles of road in Union Township	
Ohio	Ravenna	May 1	Grad. and pav. with brick 2.12 miles of county road	
Indiana	Greencastle	May 1	Improv. 13,333 1/2 ft. of macadam road in Madison township	
Indiana	Versailles	May 1, 1 p.m.	Constructing 11,370 ft. of macadam road in Adams township	
Indiana	Williamsport	May 1, 1 p.m.	Constructing a gravel road in Kent township	
New York	Albany	May 1, 1 p.m.	Paving about 8,500 mi. of roads in various counties	
Indiana	Versailles	May 1	Constructing 11,370 ft. macadam road in Adams Township	
Indiana	Bedford	May 2	Constructing roads Nos. 1 and 2	
New York	Hudson	May 2, 10:30 p.m.	Repairing portion of Warren Street with vitrified brick	
New York	Niagara Falls	May 2	Repairing and repaving various streets	
Florida	Jacksonville	May 3, 10 a.m.	Constructing about 13,000 sq. yds. asphalt macadam surfac.	
Ontario, Can.	Ft. William	May 4, 5 p.m.	Paving with asph. blk., sheet asph. or bit. about 14,100 sq. yds.	
New York	Seneca Falls	May 4, 2 p.m.	Paving Main and Bayard sts., including 12,500 cu. yds. of excavation; 17,000 lin. ft. of curbing; 15,000 lin. ft. of 3-in. drain tile; 5,000 lin. ft. vitrified pipe; 42 catch basins; 25,000 sq. yds. brick or macadam pavement	Gail L. Barnard, County Engr. John Wilson, City Engr.
Ohio	Cincinnati	May 5, noon	Improving Carthage avenue in Columbia township	J. W. Brennan, Village Engr. Stanley Struble, Pres. Bd. Co. Comrs.
Tennessee	Memphis	May 16	Constructing 5.1 mi. gravel paving, 3.9 mi. tar macadam, 1.4 vitrified brick, 2.9 wood block or bit. and 1/2 mi. old stone	Geo. C. Love, Comr. Dept. Sts.
SEWERAGE				
Ohio	Dayton	Apr. 21, noon	Constructing storm water sewers in various streets	J. C. Ely, Dir. Public Service.
Oregon	Central Point	Apr. 21	Constructing sewer system	J. W. Jacobs, City Recorder.
Michigan	Allegan	Apr. 21, 8 p.m.	Constructing Depot Hill sewer	John W. Peet, City Clerk.
Ohio	Massillon	Apr. 21, noon	Constructing sanitary sewer in Front Street	Wm. A. Pietzcker, Dir. Pub. Serv.
New Jersey	Roselle	Apr. 21, 8 p.m.	Constructing 8- and 12-in. stoneware and iron pipe sewers with all appurtenances in various streets	Jacob L. Bauer, Boro. Engr. Robert J. White, Chm. H. & S. Com.
Pennsylvania	Williamsport	May 24, noon	Constructing storm water sewer in two streets	
Pennsylvania	Pittsburg	Apr. 24	Constructing about 4,280 ft. concrete sewer from 5 ft. 8 in. x 5 ft. 11 in. to 7 ft. 4 in. x 7 ft. 9 1/2 in., and 19,800 lin. ft. brick sewers; and 8, 10, and 15-in. pipe sewers in various streets	Jos. G. Armstrong, Dir. Public Wks.
Minnesota	Mankato	Apr. 24, 10 a.m.	Constructing 1,080 ft. of 20-in.; 725 ft. of 10-in. and 160 ft. of 12-in. pipe sewer and five manholes	A. H. Scherer, City Clerk. O. R. Stone, Village Clerk.
Ohio	Beream	Apr. 24	Constructing sewer and appurtenances on Waite street	Lawrence Gresser, Boro. Pres.
New York	Long Island City	Apr. 24	Constructing sanitary sewers and appur. in var. streets	J. H. Shores, Supt. Streets.
South Carolina	Spartanburg	Apr. 24	Constructing 2,150 ft. of sewers	E. L. Barnes, Secy. Sew. Com.
South Carolina	Rock Hill	Apr. 25	Constructing sewer system complete	John M. Babcock, Clk. of Council.
Ohio	Toledo	Apr. 27, noon	Installing complete high pressure fire system	C. F. Bell, City Auditor.
Ohio	Fremont	May 1	Constructing 700 ft. of tile sewer in Linden street	D. E. Goddard, Town Clerk.
Wyoming	Lusk	May 1, 8 p.m.	Constructing sewer system	
Minnesota	Cloquet	May 1	Constructing sewers and water mains, including 13,600 cu. yds. excavation, 10,300 lin. ft. of 8-in. and 10-in. sewers, 12,000 lin. ft. 6-in. and 4-in. water mains	City Clerk.
Indiana	Kokomo	May 1	Constructing about 12,935 ft. of intercepting sewer, from 10 to 48 inches diam.; with appurtenances and connections	A. J. Havens, City Clk.
Alberta, Can.	Edmonton	May 2, 3 p.m.	Constructing 3,290 ft. of concrete sewer 10 ft. 6 in. in diameter	Ben J. Latocell, City Engr.
Florida	Pensacola	May 2	Constructing 15,060 lin. ft. storm water drains from 10 to 66-in. in diam.; and 23,880 lin. ft. of san. sewers from 6 to 24-in. in diam.	John A. Merritt, Chm. Bd. Bond Tr. John Coon, Comr. Streets. The J. L. Worley Co. Engrs., K. C.
West Virginia	Huntington	May 8, 1 p.m.	Constructing lateral 12-in. sewers in various streets	G. B. Geary, Mayor.
Kansas	Humboldt	May 8	Constructing 8, 10 and 12-in. vitrified pipe sewers	K. B. Mathes, Chm. Bd. Sew. Com.
Ontario, Can.	Toronto	May 9, noon	Constructing about 13,196 lin. ft. low level interceptor	
New York	Batavia	May 15, 10 a.m.	Constructing sewage disposal plant	
Oregon	The Dalles	May 15	Construct a section of Dist. No. 1 sewer system, cost about \$225,000	L. T. Boyle, City Engineer.
California	San Jose	July 3	Construct septic tank for County hospital	City Clerk.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
WATER SUPPLY				
Dist. of Col.	Washington	Apr. 21, 2 p.m.	Furn. 2,111 tons 16 and 20-in. cast iron water pipe; and 90 tons cast iron water pipe specials.	Cuno H. Rudolph, Comr.
New York	Warwick	Apr. 21	Repairing and rebuilding storage reservoir.	C. S. Lascar, Clk. Bd. Wt. Comrs.
Michigan	Saginaw	Apr. 21, 7:30 p.m.	Furnishing c. i. pipe and special castings.	City Clerk.
Maryland	Baltimore	Apr. 26, 11 a.m.	Furnishing a 30,000,000 gal. vertical, triple-expansion pump, boilers and other equipment at pumping station.	Alfred M. Quick, Water Engr.
North Dakota	Fargo	Apr. 27	Furnishing a high duty crank and fly wheel pumping engine with a capacity of 4,000,000 gals. each 24 hours; constructing a water purification plant complete 4,000,000 gals daily.	E. R. Orchard, City Auditor.
Ohio	Toledo	Apr. 27	Installing complete highpressure fire system including c. i. pipe, hydrant etc., except the pumping station, machinery, etc.	F. Shane, Secy. Bd. Pub. Service.
Pennsylvania	Somerset	Apr. 27	Constructing a reservoir.	Chas. I. Shaver, Secy. Boro. Council.
Florida	Fort Dale	Apr. 29, 10 a.m.	Constructing extension of water system.	Construct. Quartermaster, U.S.N.
New Jersey	Skillman	May 1, 10:15 a.m.	Extending water system, together with necessary hydrants, gates, valves, etc., at Village for Epileptics.	Jonas A. Fuld, Secy. Bd. Managers.
Sask., Can.	Scott	May 1	Drilling a deep well.	Geo. M. Phillips, Sec'y.
Ohio	Lakewood	May 9	Erecting an elevated steel tower on concrete base.	E. R. Lieblein, Clk. Bd. Pub. Aff.
Brit. Col., Can.	Penticton	May 15	Constructing filtration chambers, reservoirs, works and excavation for and laying pipes for water works system.	
Brit. Col., Can.	Vancouver	May 31, 4 p.m.	Furn. steel pipe, i. pipe; also 18-in. flexible joint c. i. pipe.	Wm. McQueen, City Clerk.
BRIDGES				
Washington	Walla Walla	Apr. 21, 3 p.m.	Furnishing material for a reinforced conc. bridge.	T. D. S. Hart, City Clerk.
Illinois	Cissna Park	Apr. 21	Const. a reinforced conc. bridge in Pigeon Grove Township.	J. H. Rothery, Town Clerk.
Ohio	New Lexington	Apr. 24	Constructing bridge over Rush creek.	Auditor Perry County.
Illinois	E. St. Louis	Apr. 25	Constructing 5 railroad bridges in Madison County.	H. D. Sexton, Pres. Bd. Trustees.
Ohio	Napoleon	Apr. 25, 1 p.m.	Repairing Perry St. Maumee River Bridge.	C. C. Mukison, County Auditor.
Iowa	Mason City	Apr. 25, 2 p.m.	Constr. 2 concrete slab bridges; one concrete arch bridge; one conc. girder bridge; two steel bridges in Cerro Gordo County.	A. S. Clark, County Auditor.
Iowa	Estherville	Apr. 26, noon	Constr. several reinforced concrete or steel bridges.	C. A. Root, County Auditor.
Pennsylvania	Reading	Apr. 26, 10 a.m.	Constructing Bordner's Bridge No. 1, crossing the Tulpehocken and Bordner's Bridge No. 2 crossing the Swatara.	County Commissioners.
California	San Francisco	Apr. 26	Const. a reinf. concrete viaduct and an earth filled approach.	Jos. L. McCormick, Sec'y B. of P. W.
Pennsylvania	Washington	Apr. 27, noon	Constructing necessary small bridges and culverts for improvement of various county roads.	John M. Moffitt, County Comptroller.
New Jersey	Rutherford	Apr. 28, 2:30 p.m.	Constructing a steel and concrete bridge over Passaic river.	John H. Burke, Chm. Bd. Chos. Fh.
Ohio	Cleveland	Apr. 29, 11 a.m.	Elimination of grade crossings and building bridge over tracks.	John F. Goldenbogen, Clk. B. C. C.
Pennsylvania	Brafford	May 1, 5 p.m.	Construct. bridges and abut., repav. and construct. sidewalks.	E. C. Charlton, City Clerk.
Oklahoma	Muskogee	May 1	Constructing 35 county bridges.	County Clerk.
LIGHTING AND POWER				
Pennsylvania	Wilkes Barre	Apr. 24, 7:30 p.m.	Lighting certain streets in Plymouth township with 20 or more arc lights for the term of 5, 7 or 10 years.	Martin Curley, Pres. Bd. Twn. Comr.
Manitoba, Can.	Winnipeg	May 1, 11 a.m.	Furnishing ornamental lighting standards.	Magnus Peterson Secy. Civic B. Con.
California	Benicia	May 1	Furn. elec. supplies for year ending June 30.	Lieut.-Col. J. W. Benet, Com. Officer.
Texas	Fort Bliss	May 1, 11 a.m.	Installing electric lighting system.	G. C. S. Quackenbush, Constr. Q.M.
FIRE EQUIPMENT				
South Africa	Johannesburg	Apr. 21, noon	Furn. 2 patrol motor fire engines.	Town Clerk.
New Jersey	Paterson	Apr. 21	Furn. automobile hook and ladder outfit and converting 2 first-class fire engines into gasoline-propelled vehicles.	T. S. Standeven, City Clk.
New York	Rensselaer	May 8	Furn. 500 ft. 2 1/2-in. fire hose.	Salt, City Clerk.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Updike, Chm. F. & W. Com.
MISCELLANEOUS				
Montana	Glendive	Apr. 21	Constructing new concrete jail, and construct. steel cells.	R. L. Wyman, Clk. Bd. Coun. Comrs.
Pennsylvania	Reading	Apr. 24, noon	Constructing new library buildings.	Chas. H. Hunter, Secy. Bd. Trust.
Massachusetts	Boston	Apr. 24	Disposal of the refuse of the city collected by the Public Works Department, except W. Roxbury and E. Boston Distts., for a term of ten years.	Louis K. Rourke, Comr. Pub. Wks.
Michigan	Grand Rapids	Apr. 29, 3 p.m.	Repairing and construct. piers at various harbors in Michigan.	C. S. Riche, Lieut. Col. Engrs.
Connecticut	Hartford	May 2, noon	Constructing new fire station.	Geo. W. Sanford, Bldg. C. B. F. C.
Ohio	Cincinnati	May 10, noon	Constructing hospital buildings.	Messrs. Hannaford & Sons, Arch.
California	Oakland	May 11	Constructing city hall, value of contract \$1,000,000.	Frank R. Thompson, City Clerk.

Metuchen, N. J.—Resurfacing of Main st., Pennsylvania Railroad to Middlesex ave., Thomas F. Dunigan, Woodbridge, Bermudez asphalt macadam, 66c. per sq. yd.; amiste, 99c. per sq. yd.; Liddle & Pfeiffer, of Perth Amboy, tarvia X, 68c. per sq. yd.; amiste, 3 in. of bottom amiste and 1 in. of top dressing, this to be placed on present road after scarifying and no extra stone to be used, \$1.39 per sq. yd.

New Brunswick, N. J.—Estimates for macadam on the road between Cranbury and South River: J. L. Butcher & Son, Farmingdale, \$10,475; A. A. Rose Construction Co., Trenton, \$12,943.31; Harry N. Scott, Cranbury, \$9,429.42.

New Brunswick, N. J.—By County Commissioners for building retaining wall at Spotswood: George M. Davison, Jamesburg, \$2,245; Thomas & Welsh, South Amboy, \$2,565; Charles P. Hillver, Old Bridge, \$2,445 and 10c. cu. yd. for extra

concrete; John P. McGovern, New Brunswick, \$2,168 and 8c. cu. yd. for additional concrete; Marcus S. Wright, South River, \$2,103; William Davison, Jamesburg, \$2,481.90; Abraham Jellin, New Brunswick, \$1,647.

Brooklyn, N. Y.—Street improvement Regulating and repaving with granite pavements on a concrete foundation the roadway of Fifth Ave. from Prospect Ave. to 25th St., J. J. Derkin, \$27,832; McFarland Contracting Co., \$29,751; Richard L. Russell, \$31,265; M. J. O'Hara, \$30,082; H. Mullin, \$30,095; Modern Pavement Co., \$29,112; Newman & Carey Co., \$32,325; John Guinan, \$30,360; J. J. McLaughlin, \$30,890; Morris E. Hickey Co., \$31,126. Regulating and repaving with asphalt on concrete foundation roadway of Washington Park from Myrtle to De Kalb Ave. and Cumberland St. from Lafayette to Atlantic Ave., Borough Asphalt Co., \$28,226; Uvalde Contracting Co., \$22,494; Cranford Co., Ninth St., \$20,740; Barber Asphalt Paving Co., \$22,578; Brooklyn Alcatraz Asphalt Co., \$21,614. Regulating and repaving with asphalt on concrete foundation the roadway of 11th St. from Second to Fourth Ave. Uvalde Contracting Co., \$10,313; Brooklyn Alcatraz Asphalt Co., \$9,614; Cranford Co., 52 9th St., Brooklyn, N. Y., \$9,126; Barber Asphalt Paving Co., \$9,662. Regulating and repaving with asphalt on concrete foundation roadway of Fulton St. from Vanderbilt Ave. to Marcy Ave., Barber Asphalt Paving Co., \$41,108; Uvalde Contracting Co., \$44,487; Cranford Co., \$40,339; Brooklyn Alcatraz Asphalt Co., 407 Hamilton Ave., \$40,181.

Bucyrus, O.—Paving South Walnut st. H. N. Oberlander, Bucyrus, \$6,266; A. Caldwell, Galion, \$6,652; P. Drake & Son, Marion, \$6,467; J. W. Scott, Marion, \$6,665; George J. Bock, Coshocton, \$6,490; Hofstetter & Dawson, Marion, \$6,053; J. V. Paule, Mansfield, \$6,053; L. R. McMichael, Bucyrus, \$6,071.

Cleveland, O.—Paving, lowest bidder C. F. Reiley, Lakeside ave., East 9th East 14th st., \$22,100; R. P. Burnett, Lakeside ave., East 26th to East 40th st., \$50,933; Baldwin Bros., West 17th st., \$35,191; Cleveland Trinidad Paving Co., Overlook road, \$9,258.

Montpellier, O.—Laying 25,500 sq. yds. paving, Hennessey Bros., Piqua, brick, \$1.10 to \$1.91 per sq. yd.; H. S. Enck, Lima, brick, \$1.88 to \$1.94 per sq. yd.; Carpenter & Anderson, Grand Rapids, Mich., asphalt, \$1.89 per sq. yd.; Cleveland Trinidad Paving Co., Cleveland, asphalt \$2.06 per sq. yd.; S. S. Saxton, Richmond, Ind., asphalt, \$1.10 per sq. yd.; Andrews Asphalt Paving Co., asphalt, \$1.99 per sq. yd.; Kneal & Ryan, Lansing, Mich., brick, \$1.88 to \$1.94 per sq. yd.; Moelering Construction Co., Fort Wayne, Ind., brick, \$1.96 to \$2.02 per sq. yd.; Fishbaugh & Karsch, brick, \$1.94 to \$2.09 per sq. yd.; G. A. Heffner & Sons, Celina, brick, \$1.64 to \$1.71 per sq. yd.; based on using local gravel; add 20c. per sq. yd. if commercial gravel is used; Lynn Burke, Paulding, brick, \$1.79 to \$1.83 per sq. yd.; Asphalt Block Co., Toledo, 2-in. asphalt, \$2.10; 2½-in. asphalt block, \$2.20 per sq. yd.; Freshwater & Sons, Celina, brick pavement, \$1.84 to \$1.91 per sq. yd. asphalt pavement, \$1.89 per sq. yd.—The Riggs & Sherman Co., Nasby Bldg., Toledo Consulting Engineers.

Portsmouth, Va.—Paving South st. in the Seventh Ward west of Chestnut st. to city limits: Bascom Sykes, Engineer of the Ward, 510 Middle st.; E. P. Lindsay offers to pave street with tarvia on 6-in. base for 95½c. per sq. yd.; Bermuda asphalt paving, \$1.03 per sq. yd.; tarvia on ½-in. base, \$1.14 per sq. yd., and \$1.23 for Bermuda asphalt on similar base; excavating work, \$1,587.50; James T. Wrenn, vit. brick on a 2-in. sand base, Mack, \$2.68 per sq. yd., granite curbing, 60c. per lin. ft.; tarvia on 8-in. base, \$1.18 per sq. yd.; Bermuda asphalt, 8-in. base, \$1.28; tarvia on 6-in. base, \$1.04; Bermuda, 6-in. base, \$1.10; Lewis Lawson, Mack brick, \$1.67 per sq. yd.; Carlisle brick, \$1.69; tarvia, 6-in. base, \$1.25; tarvia, 8-in. base, \$1.45; curbing, 60c. per lin. ft.; add 20c. per sq. yd. to foregoing figures for asphalt paving; Dalby Nottingham Co., bituminous macadam, 8 in. base, \$1.48 per sq. yd.; bituminous macadam, 6-in. base, \$1.28; add 18c. per sq. yd. to foregoing figures for Bermuda asphalt paving; E. J. McGuire, excavation work, \$1,500; vit., Mack brick, 2-in. sand base, \$1.65 per sq. yd.; curbing, 60c. per lin. ft. bituminous macadam, 16 ft. wide, 8-in. base, \$1.40 per sq. yd.; bituminous macadam, 16 ft. wide, 6-in. base, \$1.20; add 15c. per sq. yd. to foregoing figures for asphalt paving; R. D. Denby, for excavation work

Racine, Wis.—Paving of Erie and Dodge sts. from State st. to North Main st., Bullock & McHugo, Waukegan, \$2.36 per sq. yd. for Barr brick, \$2.32 for Danville an \$2.36 for Purington brick, and bid of 50c. per ft. for curb and gutter; entire job figures up to about \$14,500.

SEWERAGE

Tuscaloosa, Ala.—W. H. Nicol, City Engineer, has completed preliminary survey of proposed storm sewer to be constructed from 8th to 14th St., cost \$5,700; bids will be asked for 450 ft. 42-in., 350 ft. 36-in. and 400 ft. 30-in. concrete sewer, 450 ft. 24-in., 350 ft. 20-in. and 1,000 ft. 18-in. terra-cotta sewer, 7 manholes, 25 inlets; also some sidewalk, curb and gutter.

Fort Smith, Ark.—Mayor Fagan Bourland has recommended that work on storm sewer on south side of city be commenced at once.

Concord, Cal.—Citizens have voted \$29,000 bonds for sewer construction; bids will be asked by Engineers Sloan & Robson, San Francisco.

Dixon, Cal.—Bids will soon be received on installation of sewerage system and disposal works; cost, \$40,000. Reynolds & Whitman, Engineers.

Oakland, Cal.—Plans and specifications for sewerage of Allendale sanitary district have been adopted by Council, and more than 20 miles of sewer will be installed.

Oakland, Cal.—City Engineer Fred C. Turner is drawing up plans and specifications for storm sewer to relieve the flooded conditions of Vernon Heights and Linda Vista districts; cost, \$15,000.

Orland, Cal.—Citizens will vote May 2 on \$25,000 bonds to install sewer system.

Manchester, Conn.—South Manchester Sanitary District is planned to extend sewer system.

Palatka, Fla.—Mayor H. A. Davis has recommended extension of sewer system.

Sarasota, Fla.—City is planning to install sewer and water systems.

Americus, Ga.—Citizens have voted \$105,000 bonds for improvements; sewerage system will be extended several miles in business districts.

Blakely, Ga.—Citizens will vote April 22 on \$60,000 bonds for improvement of sewerage system and erection of school building.

Aurora, Ill.—Contract will be let in about 30 days for the construction of pipe and concrete sewers: Dist. 7, cost \$55,000; Dist. 8, cost \$35,000, and Dist. 9, \$20,000.—M. J. Tarble, City Engineer.

Danville, Ind.—After citizens had voted to install a general sewer system, to be paid for by bond issue, it was discovered that such system could not be built without exceeding 2 per cent. tax limitation, contrary to law; Board has ordered preliminary survey to determine the cost of the system, and if cost not too great sewers will be ordered built under Barrett law.

Kokomo, Ind.—Plans and specifications for a sanitary sewer, prepared by Prof. Robert L. Sackett, Purdue, have been accepted and approved by Board of Works.

South Bend, Ind.—Board of Public Works has decided to construct sewer on Pine st.

Avoca, Ia.—John S. Crick, Omaha, Neb., will make survey for installation of sewerage system.

Grinnell, Ia.—Extension of sewer system to West Grinnell is being considered.

Valley Junction, Ia.—Iowa Eng. Co., Clinton, will prepare plans for proposed sewer system.

Hutchinson, Kan.—City Commission has ordered construction of lateral to sanitary sewer in Jefferson st. district; cost about \$1,200.

Winchester, Ky.—Chas. E. Collins, Drexel Bldg., Philadelphia, is preparing plans for installation of sewage disposal plant, including settling tanks and sprinkling filters.—Dr. M. S. Browne, Chairman Sewer Committee.

New Orleans, La.—Calcasieu Savings Bank & Trust Co. has purchased entire issue of sewerage bonds, totaling \$160,000. Bids will be asked for covering construction in the course of a few weeks. T. H. Mandell, City Engineer.

Eaton Rapids, Mich.—Council has decided to build sewer on State and River Sts. in First Ward.

Austin, Minn.—City will construct 6,600 ft. of sanitary sewers; cost, \$6,800. Martin Clausen, City Engineer.

Gilbert, Minn.—Bids will be advertised at once for construction of proposed sewer system.

Dolgeville, N. Y.—Chas. E. Collins, Drexel Building, Philadelphia, Pa., is preparing plans for extension of sewers, cost \$12,000.—H. I. Patrie, Chairman Sewer Commission.

Duluth, Minn.—Cost of building sanitary sewer in Park Point has been estimated at \$19,642.70.

New Hartford, N. Y.—Town Board will consider establishment of sewer district.—A. M. Scripture, Engineer.

Port Chester, N. Y.—Plans by F. S. Odell have been approved for installation of \$100,000 sewage disposal plant on Fox Island.—C. O. Frederick, Acting President Bd. Trustees.

Niles, O.—City has sold \$20,500 bonds for south side sewer improvements to Dallas Savings Bank.

Britton, Okla.—Citizens have voted \$20,000 bonds for improvements to sewer and water systems.

Eugene, Ore.—Citizens have voted \$28,000 sewer bonds.

Reading, Pa.—Council will consider \$250,000 loan with which to complete storm water sewer system.

West Midland, Pa.—Borough Council has formulated plans for probable construction of sewage disposal plant and taken steps toward having town sewer.

Clinton, S. C.—Citizens have voted \$45,000 bonds for installation of sewerage system; bids for bonds will be asked at once.

Dallas, Tex.—Bids will be asked by Municipal Commission for constructing 6-in. sanitary sewer in Cochran St.

Richmond, Va.—Board of Aldermen has passed resolution for construction of sewer in East Leigh st., \$18,800; in Bloody Run Ravine, \$12,430; deep sewer in Broad st., \$16,000.

Burlington, Wash.—A. L. Strong, of Mt. Vernon, has been selected as engineer for proposed storm pipe sewers.

Melville, Sask., Can.—Ratepayers will vote April 24 on \$63,000 by-law for main storm water sewer.

CONTRACTS AWARDED

East Moline, Ill.—To complete sewer system to E. R. Harding & Co., Racine, Wis., \$50,995.

Lawrence, Kan.—Building lateral sewer in District No. 5, to Graeber Bros., 96½c. per ft.; Fairground and Haskell sewers, to Kennedy Plumbing Co., 51c. and 46c. per ft.

Billings, Mont.—Construction of sewer system, to Frank Savareys; pipe \$1.30 per ft., manholes \$70 each, flush tanks \$150 each, extra excavating \$60.

Girard, O.—Building sewer in Main and Stambaugh Sts. to Van Meter Construction Co., \$2,952. Other bidders: Pasqual Dioro, Youngstown, \$3,414.95; John W. Gay, Youngstown, \$3,536.73; Charles Hukari, Ashtabula, \$3,787.05; Patrick Grady, Youngstown, \$3,841.85; McGlashen & Russell, \$3,865.25; C. L. Allen, Marion, \$3,915.05; Geladini & Manfo, \$5,242.90; Joe Moss made irregular bid.

Columbia, S. C.—Building storm drain on Gervais st., Assembly to Pulaski, to L. E. & E. N. Beatty, Georgetown, S. C.; 614 ft. 30-in. cir. concrete drain, \$2.44; 446 ft. 42-in. pipe, \$2.56; 1,617 ft. 48-in., \$2.93; 12-in. vit. pipe, 75c.; 140 ft. 15-in., 90c.; 175 ft. 18-in.; \$1; 600 ft. 20-in., \$1.25; 30 ft. 24-in., \$1.60; 30-in. vit. pipe, \$2.60; 6 manholes, \$25.15; 25 inlets, \$43.40; total, \$10,192; other bidders: Weston & Booker \$11,430, and Palmette Paving Co., \$11,199.—John McNeal, City Engineer.

Seattle, Wash.—Building sewers on North and East 65th Sts. to Hayden & Sons, \$18,879.10.

South Milwaukee, Wis.—Building sewers, to R. J. Hickey, 1,291 ft. 8-in. pipe, average cut 7.5 ft., 98c.; 600 8-ft., 24c.; cut, 14 ft., \$1.97½; 32 manholes, \$33.75, total \$14,210.98; other bidders: A. C. Schreiter, \$16,764.15; Jas. Brogan, \$17,975.80; N. F. Reichert, \$20,275; Jos. Whelan, \$15,900.62; T. Stukalski, \$18,579.35, and E. R. Harding, \$18,888.75; sewage disposal plant, to same; class C sand, \$6,789; about 2,270 cu. yds. sand will be required.—J. W. Alvord and C. B. Burdick, Hartford Bldg., Chicago, Engineers.

WATER SUPPLY

Tuscaloosa, Ala.—Water Works Commission has recommended installation of additional pump costing about \$1,500.—F. G. Blair, President.

Winkelman, Ariz.—Robert Lynn has been granted franchise to establish water system.

Dorris, Cal.—Bids will be received by Town Clerk May 1 for \$12,500 water system bonds.

Orland, Cal.—Citizens will vote May 2 on \$25,000 bonds to install water works system.

Palo Alto, Cal.—Citizens have voted bonds to install auxiliary water pumping plant.

Portola, Cal.—Portola Water Co. is planning to construct large concrete reservoir at the spring under Beckwith Peak.

Leadville, Col.—Citizens have voted to install municipal water works.—N. C. Rose, Mayor.

Gunnison, Col.—Citizens have voted \$90,000 bonds for water works; about \$70,000 will be issued at this time.—Burns & McDonnell, Kansas City, Mo., Engineers.

Sarasota, Fla.—City is planning to install water and sewer systems.

Colquitt, Ga.—Citizens have voted \$22,000 of bonds for extension of water works, construction of electric light plant and erection of school building.

Jackson, Ga.—City is preparing to make extensive improvements on water works system; new mains will be laid on Indian Springs and West 3d sts. and on West ave.

Anna, Ill.—C. W. Brown, Jacksonville, is preparing plans for water works; cost about \$20,000.—J. L. Hammond, City Clerk.

Plainfield, Ill.—Village Trusts, have decided to construct water works; cost, \$25,000.

Rushville, Ill.—The Fuller-Coult Co., Chemical Bldg., St. Louis, Mo., has been selected by city to prepare plans for the construction of pumping station and pipe line; estimated cost, \$30,000.

Shelbyville, Ill.—Shelbyville Water Co. has decided to construct reservoir, capacity of 2,000,000 gal.; estimated cost, \$8,000. Charles Chester, Superintendent.

Peru, Ind.—A. T. Maltby, Consulting Engineer, Geat Northern Building, Chicago, has been selected to provide new and increased water supply and rebuild water works plant.

Cherryvale, Kan.—Citizens will vote on installation of water works.

Elk City, Kan.—Bids will be received about May 1 for the construction of water works from plans of L. Y. McFarland; cost about \$25,000.—R. B. Shaffer, City Clerk.

Sedgwick, Kan.—City is considering installation of water works; cost, \$20,000. R. R. Hobbe, City Clerk.

Corbin, Ky.—City is considering construction of water works.—W. M. Steele, Secretary.

Homer, La.—City will shortly install complete water system.

White Castle, La.—Council has decided to extend water works on Lower Bowie St.

Freeport, Me.—Town has voted to authorize purchase of town water supply plant at a price not less than \$25,000.

Gagetown, Mich.—Citizens have voted bonds for installation of water works.

Newago, Mich.—Mayor W. J. Bell has recommended that plans be started for construction of water works system.

Aurora, Minn.—Council is considering installation of one 500-gal. underwriters' pump.

Taconite, Minn.—Duluth Engineering Co., Duluth, has prepared plans for installation of water works system; cost about \$15,000.

Bassfield, Miss.—Board of Aldermen has selected A. Kramer, Magnolia, as Consulting Engineer for proposed water works.

Biloxi, Miss.—Council is considering extension of the water system, including 85 new hydrants, 13,000 ft. 4-in. pipe, 43,000 ft. 6-in. pipe and 1,800 ft. of 8-in. pipe; if a line to the Camp Grounds is put in there will be 5,300 additional feet of 6-in. pipe; approximate cost, \$60,000, not including cost of proposed pumping station improvements.

Tylertown, Miss.—I. L. Sauls has asked for 25-year franchise to install and operate water works and electric light plant.

Bridgeport, Neb.—Citizens have voted \$17,500 bonds for construction of water works.

Red Cloud, Neb.—Citizens will vote on \$6,000 bond issue for water works improvements.

Weare, N. H.—Town is considering construction of reservoir to cost about \$18,800.—J. B. Warren, Town Clerk.

Branchville, N. J.—Branchville Water & Improvement Co. has decided to construct reservoir.

Fredonia, N. Y.—Village Board of Trustees has instructed Engineer Wilder to prepare plans and estimates for improving present water works system.

Lyons, N. Y.—Witner & Brown, Consulting Engineers, Buffalo, have presented proposition to Board of Village Trustees relative to securing supply of pure water.

Riverhead, L. I., N. Y.—W. E. Sexton, Consulting Engineer, Mineola, has been engaged to prepare plans and specifications for installation of municipal water system, including eight miles of 5 to 12 in. mains, 125 fire hydrants, two triplex power pumps, each 750 gal. per min., two 75-horsepower gas engines and gas producers; brick and concrete pumping station, 150,000-gal. steel tank; tower, 150 ft. high; estimated cost, \$90,000.

Kenton, O.—Voters have decided to issue \$10,000 water works bonds to replace plant recently condemned.

Helena, Okla.—Town has issued \$10,000 of bonds for extension of water works.—L. A. Rulley, Town Clerk.

McAlester, Okla.—Council has adopted a suggestion by Commissioner of Public Works Schreiner, whereby city will build additional dam north of the dam on the city water shed at the cost of about \$50,000; dam when completed will hold 1,500,000 gals. of water; also will construct pipe line from Gaines Creek, which will require about 10,000 ft. of pipe; line with boilers and pump will cost approximately \$30,000; 6-in. steel pipe will be used.

Hood River, Ore.—City has sold \$90,000 bonds to Uten & Co., Chicago; municipal water works system will be constructed.

Blain, Pa.—Council has adopted ordinance providing \$7,000 appropriation to provide adequate water supply.—W. H. Hench, President.

McKeesport, Pa.—Mayor Arthur has recommended installation of standpipe to supply pressure in mill district.

Clinton, S. C.—Citizens have voted \$20,000 bonds for extension of water mains; bids for bonds will be asked at once.

Nocona, Tex.—Citizens will vote May 8 on \$17,500 bonds for water works.—J. L. Davis, Secretary.

Winters, Tex.—O'Neil Engineering Co., Dallas, has prepared plans for construction of water works; cost, \$20,000. W. J. McFarland is in charge.

Yorktown, Tex.—Citizens will vote May 6 on \$6,000 bonds for extension of water mains.

Ridgetown, Ont., Can.—Ratepayers will vote April 25 on \$35,000 by-law for installation of system of water works.—D. Cochrane, Town Clerk.

CONTRACTS AWARDED

Atlanta, Ga.—Furnishing fire hydrants, to the Columbian Iron Works, Chattanooga, Tenn.; approximately 200 4-in. hydrants at \$20.75 each and 100 hydrants, 6x5 in., at \$27.40; filter house, to George A. Clayton, \$5,810.20; Macke-Crawford Contracting Co. bid \$5,914.

Sparta, Ga.—Construction of water works and sewers to Walton & Wagner, Atlanta, about \$34,000; includes 3 miles of sewers and purification plant and 3½ miles of water mains, 4 to 8 in.; two 750,000-gal. pumps, air compressor, boiler, power house, 100,000-gal. brick reservoir, 80,000-gal. tank on steel tower 150 ft. to top of tank.

Chicago, Ill.—Setting two batteries, each of 300-horsepower boilers, at Roseland pumping station, 104th st. and Stewart ave., to Jos. T. Dorgan, 109 Randolph st., \$1,195; furnishing open feed water heater and purifier to Roseland pumping station, 104th st. and C. & W. I. R. R., to Platt Iron Works Co., \$888; furnishing hydraulic packing for the pumping stations to Quaker City Rubber Co., 186 Lake st., \$1,500; other packing to Anchor Packing Co., \$5,810; furnishing, delivering and erecting in place two electrically driven centrifugal pumps, including bed plates, transformers, switchboards, piping, etc., necessary to deliver 4,000,000 gal. of water against a head of 130 ft., to Platt Iron Works Co., 311 Dearborn st., \$53,900; plant is to be erected at the pumping station located at 22d st. and Ashland ave.

East Moline, Ill.—To complete water works system to E. R. Harding, Racine, Wis., \$15,500.

Montpelier, Ind.—Drilling three water wells at the light and water works to John C. Burkett, Balbec.

Coldwater, Kan.—Furnishing material and constructing water and electric lighting systems from plans of J. S. Worley Co., 217-19 Reliance Building, Kansas City, Mo., to Fred M. Clark, Savannah, Mo., \$29,180.

Easthampton, Mass.—Furnishing pipe to R. D. Wood & Co., 400 Chestnut St., Philadelphia, \$22.12 per ton; about 4½ miles of 8 and 6 in. pipe will be needed.

New Bedford, Mass.—Furnishing 60 tons of high grade "Quaker" brand of pig lead, to Bruce & Cook, New York City, and Chadwick-Boston Lead Co., Boston, Mass., \$92.40 per ton of 2,000 lbs.

St. Paul, Minn.—Pumping machinery and electric motor for the new west side well plant, to R. B. Whittaker & Co.

Kansas City, Mo.—Furnishing self-contained, vertical, triple-expansion crank and flywheel pumping engine to the Allis-Chalmers Co., Milwaukee, Wis., \$129,500 for a direct flow pump, 66-in. stroke.

South River, N. J.—To the Buffalo Steam Pump Co., of Buffalo, N. Y., for furnishing pumps for water works plant; equipment consists of two 5-in. 2-stage centrifugal pumps, each having a capacity of 800,000 gal. of water per day against a total head of 135 lb.; pumps will be driven by 75-horsepower, 1,700-r.p.m. Fort Wayne motors.

Ogdensburg, N. Y.—Construction of pumping station, filters, intake and mains to L. B. Cleveland, Watertown, \$79,349.

Fernbank, O.—Furnishing material and laying water pipe, furnishing valves and boxes to U. S. Cast Iron Pipe & Foundry Co.; to Bourbon Copper & Brass Works Co. and to J. H. L. Barr; total cost, \$14,238.

Sugar Creek, O.—Construction of the water works system, pipe and specials to the Clow Pipe Co., Coshocton, 4-in., \$23.50; 6-in., \$22.50 per ton; pipe laying to A. Sheets, Newcomerstown, 18c. for 4-in., 20 cts. for 6-in.; 40,000-gal. tank and tower to Des Moines Bridge & Iron Co., Des Moines, Ia., \$1,995; valves, hydrants and valve boxes to Darling Pump & Mfg. Co., hydrants, \$22; 4-in. valves, \$6.50; 6-in. valves, \$10.50; valve boxes, \$2.70; bids for pumps and engines will be asked as soon as water supply wells are completed.

Columbia, S. C.—Laying water mains, to Weston & Brooker, \$2,368; bid of the Hill Engineering Co., Atlanta, \$2,203.40, was not accepted because it did not comply with

specifications of the City Engineer; water pipe and other supplies will be furnished by Lynchburg Foundry Co., Lynchburg, Va., \$3,780.20; bid of the American Cast Iron Pipe Co., Birmingham, Ala., \$4,077.72.

BIDS RECEIVED

Ontario, Cal.—Construction of pumping plant: The Fairbanks, Morse Co., Los Angeles, \$22,180, including building; Pacific Coast Mfg. Co., \$30,122 for plant consisting of 250-h.p. De La Vergne, crude oil engine, air compressor, triplex pump, etc.; Pomona Mfg. Co., \$15,091 for a gas engine plant to lift 100 miners' instruments 6 ft. above wells; also to install electric power plant, including two 75-h.p., \$12,946; Smith, Booth, Usher Co., four bids, ranging from \$3,365 to \$1,773 for plant to lift water from pumping plant to reservoir; George E. Dow Pumping Engine Co., same plant, \$3,715 to \$5,100.—F. E. Trask, Laughlin Bldg., Los Angeles, Engineer.

Toulon, Ill.—Constructing system of water supply pipes, from plans of W. S. Shields Co., 1201 Hartford Bldg., Chicago; M. Murphy, Chicago, \$15,712; Des Moines Bridge & Iron Co., \$14,968; E. Pronger & Fletcher, Blue Island, \$14,792; A. J. Anderson & Co., Kewanee, \$16,238.60; Kewanee Sanitary Supply Co., Kewanee, \$13,142.60; C. T. Bartlett, Evanston, \$14,740; Cook Constr. Co., Des Moines, Ia., \$14,972; Geo. A. Maleny, Kewanee, \$14,782; A. D. Thompson, Peoria, \$14,711, and John O'Neil & Sons, Peoria, \$17,148; work consists of 1,200 ft. 8-in., 8,150 ft. 6-in. and 13,340 ft. 4-in. c. i. water pipe, 47 hydrants, 22 valves, 3-in., 6-in. and 4-in., and 21 boxes.

New York, N. Y.—Making test borings, section 1, for proposed pressure tunnel crossing under Harlem River, north of Central Bridge; section 2, for three proposed tunnels, one at Westchester ave. and Bronx River, and one at River ave. and New York Central Railroad, and one at 135th st. and Mott Haven Canal; Grant Rohrer, 299 Broadway, section 1, \$10,955; section 2, \$16,690.

Troy, N. Y.—Construction of the Martin-Dunham Reservoir: Reservoir Construction—McDonough Construction Co., Troy, \$155,278; Corliss Construction Co., \$158,851; Philip Casey, \$174,703; Brown & Lowe, \$186,284; Powers & Mansfield Co., \$199,219; Haggerty & Drummond Co., \$214,410; Winston Construction Co., \$219,529. Cast Iron Pipe—John Fox & Co., \$2,163; Donaldson Iron Co., \$2,153; Charles Millar & Sons Co., \$2,138; R. D. Wood & Co., Utica, N. Y., \$1,997. Valves, etc.—Ludlow Valve Co., Troy, \$978; Eddy Valve Co., \$1,033; Rensselaer Valve Co., \$1,037.

Falls City, Ore.—Construction of the municipal water works: Jahn Contracting Co., Portland, \$21,206; B. Henske, Portland, \$23,514; K. Sauchet, Corvallis, \$24,200; Moffett Parker, Oregon City, \$24,299.25.

Galveston, Tex.—Construction of the city's duplicate water main across Galveston Bay: Isaac Heffron, of Galveston, \$66,389 and \$6.16 per lin. ft. for extra 30-in. pipe that may be needed; A. M. Blodgett Construction Co., causeway contractors, \$70,652 and \$6.50 per ft. for extra pipe; Kelso & Vautrin, of Galveston, \$72,024.54 and \$7.25 for extra pipe; A. L. Patterson, of New Orleans, \$85,051.40 and \$7.90 per ft. for extra pipe.

LIGHTING AND POWER

Fresno, Cal.—Pacific Gas & Electric Co. will lay 7½ miles of 6, 8 and 10 in. gas mains; cost, \$40,000. A. W. Florence, District Manager.

Los Angeles, Cal.—Eagle Rock Water Co. has secured franchise for stringing poles and wires for street illuminating system and commercial lighting system.

San Bernardino, Cal.—Southern California Gas Co. has asked Board of Supervisors for a franchise for laying of network of gas mains in county.—C. M. Grow, Local Manager.

Americus, Ga.—Citizens have voted \$105,000 bonds for improvements to water works, sewers and streets.

Colquitt, Ga.—Citizens have voted \$22,000 bonds for erection of electric light plant.

Shoals, Ind.—Bids will be asked about July 1 for construction of power plant. F. W. Bateman, City Engineer.

Central City, Ia.—Power plant to produce electricity to light five Iowa towns is to be erected this summer by Fred J. Cross, of Monticello; towns are Cogon, Central City, Center Point, Walker and Springville.

Clarion, Ia.—M. E. Mozengo and W. H. Carr have purchased electric light plant; will install day current and other improvements.

Jewell, Ia.—W. H. Grover, of Ames, will soon commence construction of electric light plant.

Walker, Ia.—Citizens have voted to grant Mr. Cross, of Monticello, franchise for electric power and heating plant.

Webster City, Ia.—Special election is being considered on \$25,000 bond issue to equip electric light and power plant.

Homer, La.—Town Council has under consideration proposition of acquiring electric light plant owned and operated by Ed. Sawyers.

Baltimore, Md.—Superintendent of Lamps and Lighting is having specifications drawn asking for bids for electric light globes, which are to be renewed yearly.

Jackson, Mich.—Michigan United Rys. Co. is considering erection of power plant and substation to have 6,000-kilowatt capacity. M. S. Ralls, Chief Engineer.

Marquette, Mich.—Cleveland Cliffs Iron Co. has decided to erect power dam on Carp River between Nagaunce and Marquette; power station will be built to develop 7,000 horsepower.

Duluth, Minn.—Council has passed resolution calling upon City Engineer for estimate of probable cost of constructing plant for furnishing electric light, heat and power.

Tylertown, Miss.—Q. L. Sauls has asked for 25-year franchise to install and operate electric light and water works plant.

Chillicothe, Mo.—Fuller & Coulte, Consulting Engineers, St. Louis, Mo., will at once prepare plans for proposed light plant.

Franklin, Neb.—Bids will be asked about May 1 for construction of an electric light plant; cost about \$8,000.

Scotts Bluff, Neb.—F. H. Robert and A. B. Cross will build concrete electric lighting and power plant; cost, \$25,000. F. H. Robert, Engineer.

Gardnerville, Nev.—Truckee River General Electric Co. will extend power lines as far as Virginia Ranch; distance, 2½ miles.

Raleigh, N. C.—Plant of Rockingham Power Co. at Blewitt Falls has been transferred to the Yadkin River Power Co., Raleigh, with \$4,000,000 capital; company has purchased 11½ acres of land northwest of city for a big transforming station; lines are being surveyed from Blewitt Falls to Raleigh, hence to Durham, Henderson, Goldsboro and Fayetteville, with Raleigh as a distributing center.—Chas. E. Johnson, President.

Barberton, O.—Bids will be advertised for soon by city for lighting streets for the coming year; present contract with the Mohican Oil & Gas Co. expires June 1.

Helena, Okla.—Town has issued \$10,000 of light bonds.—L. A. Ruley, Town Clerk.

Corvallis, Ore.—Albany Interurban Railway has asked to use certain streets in city over which power transmission lines will be constructed.

Eugene, Ore.—Citizens have voted \$25,000 bonds to install and equip series Tungsten electric light system.

Altoona, Pa.—Plans have been completed and work will be started at once by Penn Central Electric Light and Power Co. on construction of a conduit system for its wires within fire district, aggregate cost of which will be in the neighborhood of \$250,000.—Kein Dodge, General Manager.

Philadelphia, Pa.—Philadelphia Electric Co. will erect auxiliary power plant on 30th st.

Edgefield, S. C.—Election on installation of electric light plant is being considered.

Granbury, Tex.—Granbury Water, Ice, Light & Power Co. will need electrical machinery.

Llano, Tex.—Municipal lighting system will be extended.

Tulia, Tex.—Citizens have voted \$25,000 bonds for construction of electric light plant and water works.

Tacoma, Wash.—Municipal Commission has authorized Commissioner of Light and Water to advertise for bids on certain cross arms for the light department; also for bids for 1,000 h. p. electrical current for operating the pumping plant at station C during the "on peak" hours.

Bayfield, Wis.—Water & Light Commissioners will soon improve electric light plant.

Monterey, Mex.—William Mackenzie, Toronto, Canada, President of Canadian Northern Railroad, will soon begin installation of gas plant and construction of distributing system in city; W. A. Aldrich, Grand Rapids, Mich., has finished making investigation of situation; Lewis Lukes is in charge.

New Westminster, B. C., Can.—Council is considering installation of municipal gas plant.

Thessalon, Ont., Can.—City will install electric light plant and power house.

CONTRACTS AWARDED

Key West, Fla.—Lighting streets with tungsten lights, three years, to Key West Electric Co.

Chicago, Ill.—Furnishing 2,270,000 arc light carbons to the National Carbon Co., Cleveland, O., \$31,665.

Freeport, Ill.—Lighting city for five years to Freeport Railway & Light Co., arc lights, \$67 per year; boulevard lights, \$36 per post.

Richmond, Ind.—Engine and other machinery and equipment for the municipal electric light plant to the Horen, Owens, Rentschler Co., Hamilton, O., \$8,250.

Salem, Mass.—Street lighting, five years, to Salem Lighting Co.; company will supply 25 magnetite arc lamps, 225 6.6-ampere arc lights and 700 tungsten lamps of 60 candlepower, \$36,756 per year.

Carlisle, Ky.—Council has renewed contract with Carlisle Electric Light and Power Co. for lighting streets.

Westfield, Mass.—Furnishing cables for underground conduit system of electric light and power system in connection with improvements in E. m. st. and Park Square, to Safety Insulating Wire and Cable Co., New York, \$11,655.

Eveleth, Minn.—To John S. Swanson, Duluth, to install and furnish material for Grant ave. White Way, \$4,796.

Phillipsburg, N. J.—Council has decided to enter into contract with Easton (Pa.) Gas and Electric Co. to light streets for 10 years, \$65 per year for each arc light.

Prospect, Ore.—By Rogue River Electric Co., to Prospect Construction Co., 218 West Main St., Midford, which will sublet the following: 50 miles of pole line, 40-ft. poles, 30 to the mile; building 5,000 ft. of 5x9-ft. wood flume and hauling 750 tons of supplies.

BIDS RECEIVED

Jacksonville, Fla.—Building city electric light power station; furnishing traveling crane; for a 30-ton, 3-motor traveling crane, proposals were received as follows: Pawling & Harnischfeger Co., Milwaukee, \$5,375; Manning, Maxwell & Moore, New York, \$6,365; Case Crane Co., Columbus, O., \$4,671; Toledo Bridge & Crane Co., Toledo, \$5,175; Niles Electric Traveling Cranes, Philadelphia, \$4,960. For four 500-horsepower, horizontal, water-tube boilers for 200 lbs. working pressure. Under the notice for bids in this connection proposals were also asked for removal of two batteries of boilers, now in use at the old station, together with separate bids for installing complete, ready for main steam and oil connections, sixteen Peabody oil burners and pipe for re-erected boilers: Babcock & Wilcox Co., New York, boilers, \$39,384; burners, \$1,172; E. Keefer Co., Williamsport, Pa., boilers and burners, \$20,186; Casey-Hedges Co., Chattanooga, boilers, \$19,200. For two surface condensing equipment: Henry R. Worthington Co., New York, \$53,000; Alberger Condenser Co., New York, \$40,775; C. H. Wheeler Manufacturing Co., Philadelphia, \$32,950. Eight super heaters for connection to and use with water-tube boilers: Power Specialty Co., Philadelphia, \$13,000; Babcock, Wilcox Co., New York, \$8,156. Two outside, center packed, plunger boiler feed pumps: Exeter Machine Works, Philadelphia, \$2,315; Harrison Safety Boiler Works, Philadelphia, \$2,100; Warren Webster Co., Camden, N. J., \$1,850. Six piston pattern pumps, with drip pan, the following bids were received: Warren Steam Pump Co., Warren, O., \$4,228; Epping Carpenter Co., Philadelphia, \$3,300; C. H. Wheeler Manufacturing Co., Philadelphia, \$5,985; T. T. Burchfield Co., Philadelphia, \$4,890; Henry R. Worthington Co., New York, \$6,183. Two turbo-generators, 1,500 kilowatts, 6,600 volts, three-phase, 60-cycle: Allis-Chalmers Co., Milwaukee, \$57,930; General Electric Co., Schenectady, \$50,675; Westinghouse Machine House, Pittsburg, \$55,829. Removal and re-erecting the two 1,500-kilowatt turbo-generators now in use at the old plant: Allis-Chalmers Co., Milwaukee, \$7,504.

Eveleth, Minn.—Installing Grant Ave. White Way: Adams-Bagna Co., Chicago, 46 standards, complete, \$1,546.52; incomplete, \$44.07 each; Lukk Bros., Aurora, Ill., costs, \$27.60 each; with base, 40 each; without base, \$33 each; with base, \$46 each; without base, \$38 each; John S. Swanson, Duluth, system complete, \$4,359; city furnish material, \$460; 200 lamps, 500 watts, \$39.50 each; 46 alabaster globes, \$1,226; 10-in. lamp, \$1.69 each; 6-in. lamp, 70 cts. each; wiring, etc., \$1,637; McDonald Boiler Works, Des Moines, Iowa, Crown post, \$27; Regal post, \$33; Machbeth post, \$36; Imnerial, \$44; Egyptian, \$44; Flour City Iron Works, 46 posts, \$50 each; globes, \$299; Capital post, \$46; Corinthian post, \$65; Twitcher Electric Co., Virginia, system, complete, \$4,908; Lawrence & Rutherford, Virginia, material, \$1,127.20; work of installation, \$150; Zenith Electric Co., Eveleth, installation, \$697; tungstens, \$1.35 each; 16-in. globes, \$2.98 each; 12-in. globe, \$1.18; wiring, etc., \$1,798.55; Marshall-Wells, Duluth, 230 tungstens, 100 watts, \$1.03 each; 16-in. globes, \$1.58 each; 12-in. globes, 60 cts.; Western Electric Co., Minneapolis, posts, complete, \$43.20 each; incomplete, \$1.72; 16-in. globe, \$1.72; 12-in. globe, 59 cts.; 230 tungstens, 100 watts, \$1,108; H. E. Franklin Co., Milwaukee, posts, complete, \$45 each; installation, \$2,070; 100-watt tungstens, \$1 each; 16-in. globe, \$3 each; 12-in., \$1.50.

Dayton, O.—Dayton Lighting Co. has submitted proposals for lighting city streets by boulevard lighting system; company proposes to turn over to city direction of the lighting which it has served for several months by private contract with property owners; there are 351 poles in city; company's bid is for \$125 per pole per year for one-year contract and \$67.50 per pole per year for five-year contract; no other bids were submitted.

FIRE EQUIPMENT

Thorsby, Ala.—City wants chemical fire extinguisher; also to correspond with manufacturers. P. K. Villadsen can be addressed.

Fort Smith, Ark.—Mayor Fagan Bourland has recommended erection and equipment of fire house at North B. and H. sts.

Hanford, Cal.—City Board of Trustees has decided to purchase auto chemical fire truck; present chemical and hose apparatus is to be exchanged.

Palo Alto, Cal.—Citizens have voted bonds to purchase auto fire engine.

Sacramento, Cal.—Architect E. C. Hemmings will prepare plans for erection of fire station on 20th st.

Denver, Col.—City will have \$15,000 available for purchase of steamer and two auto fire trucks.—T. F. Owens, Chief.

Naugatuck, Conn.—Town will vote in May on appropriation to purchase auto chemical and pump. Address Fire Chief Clark.

Stratford, Conn.—Site at Nichols and Johnson Aves. will be purchased for erection of fire house. Alfred Shippe, President Fire Company.

Bridgeville, Del.—Local firemen have decided to erect \$3,000 hall.

Brunswick, Ga.—Council will ask for bids for furnishing fire truck.

Sterling, Ill.—Council is considering purchase of additional fire apparatus.

Milwaukee, Wis.—Council has set aside \$1,300 for comfort station in connection with Sixth st. viaduct.

CONTRACTS AWARDED

Michigan City, Ind.—To Fitzsimmons & Connell Co. to erect sea wall along west side of harbor, \$17.45 per lin. ft. for cooping.

Hutchinson, Kan.—Sprinkling streets to M. M. Booher, W. H. Shipp and G. Hildebrandt.

Salina, Kan.—Erecting city hall, to Nelson Building Co., \$38,491.66; jail, to same, \$1,017.15.

Lake Charles, La.—Building Court House to the Texas Building Co. for fireproof building to cost \$180,132.

Boston, Mass.—Furnishing about 722 lb. iron picket fence for Charlesbank Playground to Geo. A. Houdlette & Son, \$1,235.

Gilbert, Minn.—Emptying garbage cans of village every second day, to O. Mattal, \$90 per month.

Paterson, N. J.—Building retaining wall and steps at Westside Park, to George W. Cisco, 34 1/2c and 32c.

Auburn, N. Y.—By Council for subway in East Genesee st. from John st. to Hunter ave. to Brayer Bros., Auburn, fib duct, \$25,808.50.

Buffalo, N. Y.—Installing 40-ton garbage refuse destructor, with accessories, to be erected at the present utilization plant Hamburg and Scott sts., to the Destructor Co., 111 Broadway, New York City, \$14,770.

Saranac Lake, N. Y.—Collection of garbage and refuse from the village, to R. L. Johnson, \$2,340 for year.

Schenectady, N. Y.—Building cottage Rotterdam pumping station, to Cook Ripley, \$3,097.78.

Syracuse, N. Y.—By Board of Supervisors for erecting Coroners building; painting, Woese Decorating Co., \$750; mason work to D. Rafferty & Son, \$9,377; carpenter work, to J. J. Sherlock, \$6,256.

Syracuse, N. Y.—Flushing streets, to Wm. Lowry, \$5.74, and sprinkling with electric cars, to American Sprinkler Car Co., \$5 per month.

Carnegie, Pa.—Collecting and disposing of garbage, to W. H. Prosser, city, \$4.2 per year.

South Bethlehem, Pa.—To Wm. J. Repsher to collect garbage for two years, \$10,767.

Columbia, S. C.—Furnishing summer uniforms of Columbia policemen and firemen to the M. L. Kinard Clothing Co.

Sabinal, Tex.—Erecting jail, to A. Toepferwein, contractor.

Heathsville, Va.—By Board of Supervisors of Westmoreland County, to Pauly J. Building Co., of St. Louis, Mo., George Smith, contracting agent, for construction of a modern two-story jail at Montross.

Portsmouth, Va.—Furnishing police uniforms for summer, to Breslauer & Anthony, city.

North Yakima, Wash.—Paving two improvement districts with concrete, Warren Construction Co., \$150,000.

Seattle, Wash.—Construction of two-story free bathing pavilion on Alki Av. and 61st St., West Seattle, to Jenkins Jones, Hinckley Block, \$29,892. Other bidders: Alex. Dow, \$24,876; Rounds-Hurst Co., \$25,425; B. H. Graft, \$25,739; Butcher Construction Co., \$25,900; McClelland Hickey Co., \$29,266; work includes a 30 ft. sea wall.

Berwood, W. Va.—To Dixon Eng. Co. Toledo, O., for crematory of 12 tons' daily capacity, about \$8,000.

Milwaukee, Wis.—Furnishing 1,700 new street signs, to Clifford A. Loew; each w cost 3 1/2c.

Winnipeg, Man., Can.—By city to Bruce and A. Bostrum for installation of public baths, \$44,880.—William Bruce Architect.

BIDS RECEIVED

Long Beach, Cal.—Constructing 30-ft. cement walk and sea wall over 1 1/4 mi. in length, with ornamental electric light poles carrying cluster lights every 100 ft. for entire length of boulevard; J. D. Kee Co., \$120,985; J. C. Beer, \$122,947; Arthur S. Bent, \$140,000; J. W. Young, \$121,490.

Syracuse, N. Y.—Street sprinkling, five districts; John Young was only contractor to put in bids for sprinkling with calcium chloride solution; in each district the price was \$4.40 for 100 ft. per week; lowest bidder, William J. Lowery, \$5.74; other bidders: John Young, \$6.95; Central City Paving Co., \$6.85; Albert Gaffey, \$6.89; C. Hookway, \$6.58; C. P. De'ong, \$6.49; C. Amos, \$6.42; only bid for sprinkling with electric car was by American Sprinkler Co. Co., \$550 a month for each car; streets covered by contract are only those in which there are street car tracks.

Akron, O.—Erection of comfort station Main and Market sts., John Crisp & Son, \$7,099; Hunt & Wigley, \$6,853; Akron Storage and Contracting Co., \$9,764, and McShaffrey & Son, \$7,790.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Minnesota	Duluth	Apr. 21, 10 a.m.	Grading, paving and otherwise improving portion of Third Alley; construct, repair, and relay plank sidewalks for season of 1911.	Olof G. Olson, Pres. Bd. Pub. Wks. Chas. A. Dishrow, Chm., Pk. Com. W. W. Caldwell, Commissioner
Pennsylvania	Harrisburg	Apr. 24, noon	Constructing a road in Wildwood Park.	John M. Murch, County Auditor. R. H. Heppell, City Clerk.
New York	Long Island City	Apr. 24, 11 a.m.	Grading, curbing and paving with sheet asphalt various streets.	Walter E. Winne, City Engr.
Texas	Galveston	Apr. 24, 11 a.m.	Sloping, bulkheading, surfacing and paving a highway in Gal. Co.	C. A. Barnard, City Clerk. Board Public Works.
New York	Dunkirk	Apr. 25, 8 p.m.	Grading and macadamizing about 17,300 sq. yds.	John M. G. Carrera, City Clerk Cuno H. Randolph, Commissioner.
Illinois	Danville	Apr. 25, 7 p.m.	Paving with bituminous mac. about 11,000 sq. yds.; and 5,000 lin. ft. concrete gutter.	John H. Mollitt, Co. Comptroller. Henry N. Knott, City Clerk. W. B. Dryden, Secy. B. P. Imp.
New York	Plattsburg	Apr. 25, 7:30 p.m.	Constructing about 1,400 sq. yds. asphalt block pavement; and 1,400 sq. yds. vitrified brick pavement and 1,500 sq. yds. concrete pavement.	John J. Wenner, Clk. B. P. Serv. Fred. Shane, Secy. Bd. Pub. Serv. Jacob Klein, Dir. Pub. Serv. Nathan G. Wallace, Audr. Vigo Co.
Kentucky	Louisville	Apr. 26, 2 p.m.	Paving one mile of streets with vitrified brick, est. cost \$44,000.	Lemuel Shipman, Audr. Benton Co. S. W. Murray, City Clerk.
Florida	St. Augustine	Apr. 26, 7:30 p.m.	Furnishing 10,000 gals. bituminous asphalt; 700 tons crushed stone; 50 tons screenings.	P. D. Thurmond, City Engineer. Edgar A. Stagg, Audr. Clay County.
Ill. of Col.	Washington	Apr. 27, 2 p.m.	25,300 gals. bituminous binding mat. for bit. macadam roads.	Philip Prieoleau, City Engr.
Pennsylvania	Washington	Apr. 27, noon	Constructing various country roads of macadam or brick; necessary culverts and small bridges.	John J. Wenner, Clk. B. P. Serv.
Minnesota	Minneapolis	Apr. 28, 7:30 p.m.	Furnishing a stone crushing plant.	
Missouri	St. Louis	Apr. 28, noon	Installing a municipal asphalt plant.	
Ohio	Cincinnati	Apr. 28, noon	Grading, setting cement curbs, paving roadway with brick and constructing drains and inlets in portion of Ludlow ave.	
Ohio	Toledo	Apr. 28, noon	Grading portion of Albert street and paving central 20 ft. with tar mac. together with nec. curb, retain. walls, drainage, etc.	
Ohio	Springfield	Apr. 29	Construct. sidewalks and gut., and mac. portion of College ave.	
Indiana	Terre Haute	Apr. 29, 11 a.m.	Grad. and pay. with gravel various roads in Vigo County.	
Indiana	Fowler	May 1, 1 p.m.	Constructing free stone roads in Benton County of crushed blue stone, together with bridges and drainage.	
New York	Binghamton	May 3	Paving portion of Water street with vitrified brick.	
Missouri	Fulton	May 4	Construct. 9,000 yds. brick pavement on 5-in. concrete foundation; 12,000 yds. mac. with binder and 10,000 ft. con. curb.	
Indiana	Brazil	May 5, 11:30 a.m.	Constructing two gravel roads in Clay township.	
Florida	Jacksonville	May 12, 2:30 p.m.	Grading, curbing and paving with vitrified blocks of some standard brand various streets.	
SEWERAGE				
Ohio	Cincinnati	Apr. 28, noon	Constructing main and lateral sewers.	John J. Wenner.
South Dakota	Canton	May 2	Extending the sewer system at the Canton Insane Asylum.	Dr. Harry R. Hummer, Supt.
Wisconsin	Baraboo	May 17	Constructing trunk sewers, 3,000 lin. ft. 30 and 27-in. pipe.	A. H. Huebing, City Clerk.
WATER SUPPLY				
New York	New York	Apr. 21, 2 p.m.	Furnishing valves.	Henry S. Thompson, Comr. W. S.
Iowa	Sioux City	Apr. 22, 10 a.m.	Constructing 100,000 gal. steel tank and tower and furn. two triplex single or double acting power pumps and two gas. eng.	G. B. Healy, Supt. Pks. & Propert. C. E. Soles, City Comptroller.
Pennsylvania	McKeesport	Apr. 24, 4 p.m.	Laying 2,710 ft. of c. i. water pipe mains.	John A. Affleck, Pres. W. & L. D.
Pennsylvania	Harrisburg	Apr. 24, 3 p.m.	Furn. c. i. pipe and special castings, valves, hydrants, etc., for year ending May 31, 1912.	Capt. F. T. Arnold, Con. Q.M., U.S.A.
Connecticut	Ft. H. G. Wright	Apr. 25, 11 a.m.	Constructing additions to water system, including 2 reinforced concrete pump houses, 2 electrically driven centrifugal pumps, water mains and reinforced concrete storage reservoir.	Henry S. Thompson, Conr. W. Sup.
New York	New York	Apr. 26, 2 p.m.	Installing pump slip indicators, and constructing pitometer vaults, at 2 pumping stations.	A. F. Kirstein, Supt. Bd. W. Comrs.
New Jersey	Rahway	May 3, 8 p.m.	Furn. one 5,000,000 gal. horizontal, high-duty, cross-compound, crank and fly-wheel pumping engine.	
BRIDGES				
New York	Niagara Falls	Apr. 24, 3 p.m.	Construct. abut. of bridge over tracks of N. Y. Central.	Asher T. Cudaback, Pres. B. G. C. C.
New Jersey	Hackensack	Apr. 25, 2:30 p.m.	Constructing bridge across Passaic river.	John H. Kehoe, Chm. Pas. Co. Com.
Pennsylvania	Danville	Apr. 29, 2 p.m.	Construct. a reinforced conc. bridge near Washingtonville, 50-ft. clear span.	Horace Blue, Clerk Co. Comrs.
LIGHTING AND POWER				
Illinois	Ottawa	Apr. 25	Elec. wir. and light posts to light Ill. river bridge and appr.	Benj. F. Krouse, City Clerk.
Ill. of Col.	Washington	May 1, 2 p.m.	Furn. 830 more or less c. i. lamp posts and access. special design	Cuno H. Randolph, Conrs.
MISCELLANEOUS				
Pennsylvania	Harrisburg	Apr. 24, noon	Constructing an engine house.	C. A. Garverich, Chief Engineer
Pennsylvania	Reading	May 3	Furn. sup. for fiscal year; clean. paved sts. and catch basins.	Caleb Steidner, City Clerk

STREET IMPROVEMENTS

St. Augustine, Fla.—Council has decided to have Bay st. paved with asphalt macadam from Fort to King st.

Muncie, Ind.—Board of Public Works will let contracts during spring for paving number of streets with brick.

Pennville, Ind.—Grier F. Gemmill and other residents have petitioned Board of Commissioners of Jay County for brick streets.

Denison, Ia.—City has made a contract with the Consolidated Engineering Co., Omaha, Neb., to make plans and specifications for laying 30 blocks of paving in the near future.

Lawrence, Kan.—Council has decided to pave Quincy st.

Augusta, Ky.—Bracken County Fiscal Court has ordered election on \$25,000 bonds for turpentine repairs.

Georgetown, Ky.—County Board is considering purchase of 1,500 road roller.

Louisville, Ky.—North side of Broadway, fourth ave. to Campbell st., will be newly asphalted at estimated cost of \$30,000.—M. J. Neal, Vice Chairman Board of Works.

Hodgenville, Ky.—Town Board will extend \$1,000 in improving College st.

Dodge Park, Md.—Kent Citizens' Association is planning to build road from Malboro pipe, this town, to Huntsville, distance 1/2 miles.—O. C. Strawn, President.

Lowell, Mass.—Following estimates have been given by Engineer Kearney: Moody st., macadam from bridge to Sixth ave., 7,100; wooden block paving, for Moody st.

bridge, \$5,200; Riverside st., macadam, \$4,850; macadam for Summer st., \$1,310.

Somerville, Mass.—Mayor Burns has recommended following appropriations on funded debt account: Highway construction, \$44,000; highways, paved gutters and crossings, \$6,000; sidewalk construction, \$16,000.

Worthington, Mass.—Town has voted \$500 to be used with like sum appropriated by State Highway Commission for betterment of roads.

Eveleth, Minn.—Aldermen are considering estimate of City Engineer P. F. Huntington of over \$13,000 to pave streets and alleys between Monroe and Jones sts. and Douglas and Grant and Adams aves. with tar macadam.

Long Branch, N. J.—Council will consider resurfacing entire length of Broadway and 3d ave. and portions of North Broadway.—B. B. Newcomb, City Clerk.

Cincinnati, O.—Service Director Sundmacher has approved revised plans and specifications for improvement of Ludlow ave., between Brookline and Clifton aves., and ordered work readvertised.

East Mauch Chunk, Pa.—Petition is being circulated for construction of public road from this place across Bear Mountain to Walksville.

Farmersville, Tex.—Citizens have voted \$10,000 bonds for street improvements.

Dallas, Tex.—City Commissioners have rejected all bids for paving Columbia ave.

McGregor, Tex.—Commissioners' Court of McLellan County has ordered road bond election May 27 on bond issue of \$100,000 for purpose of building macadamized roads.

San Marcos, Tex.—Road District No. 1 will vote May 20 on \$20,000 road improvement bonds.

Norton, Va.—John Nuveen & Co., Chicago, have purchased \$25,000 street and sewer bonds; work will begin at once.

Chehalis, Wash.—Council has passed street improvement resolutions providing for about \$56,000 worth more of hard surface paving.

CONTRACTS AWARDED

Bridgeport, Conn.—Paving East Housatonic ave., to Burns Company, 47 1/2c. per lin. ft.

Rochester, N. Y.—Street improvements: Kingston st., brick pavement, to Thomas Holahan, \$8,597; Arch st., brick pavement, to William H. Sears, Second, \$6,603; Francis st., brick pavement, to Clarence Aikenhead Co., \$3,615; Brooks ave., cement walks, to M. J. Erinn, \$385.25; Reservoir ave. sewer, to Passero & Petrossi, \$293.50; Anthony st. sewer, to the John Petrossi Co., \$470.50; Fairview ave., cement walks, to M. J. Erinn, \$888.75.

Lawton, Okla.—Street paving, to C. H. Shaw Construction Co., city, 21,036 cu. yds. excavation, 2,600 ft. full haul, 23c.; 75,483 sq. yds., Oklahoma natural rock paving, \$1.69; 20,936 lin. ft. straight combination curb and gutter with stone cushion, 70c.; gravel cushion, 70c.; 3,115 lin. ft. radius combined curb and gutter, stone cushion, 72c.; gravel cushion, 70c.; 2,236 lin. ft. straight curb, stone cushion, 60c.; gravel cushion, 58c.; 7,652 lin. ft. straight gutter,

stone cushion, 55c.; gravel cushion, 55c.; 333 lin. ft. radius gutter, stone cushion, 60c.; gravel cushion, 60c.; 3,982 lin. ft. marginal curb, 3 x 12 oak header, 10c.; 39 catch basins, \$1,750; 410 lin. ft. 8-in. vit. sewer pipe, 40c.; 10-in. sewer pipe, 10c., and 12-in., 10c.; latter two items may be substituted; total \$156,319.39; 200 days; other bidders, E. R. Kerby, city, \$165,180.46, 180 days; Mayfield, Shaw & Redman, city, \$158,244.99, 200 days; C. I. Derr, Oklahoma City, \$173,643, 180 days; Engineer's estimate, \$179,002.17.

Columbia, S. C.—Paving Gervais st., Main to Pulaski, to Weston & Brooker, with Augusta vil. brick, \$2.19 per sq. yd.; Lady Washington and Hampton sts., Sumter to Assembly st., to same, with 3-in. creosoted block gum blocks, \$2.45 per sq. yd. material to be furnished by U. S. Wood Preserving Co.; as many as six blocks and not more than 13, to Atlantic Bitulithic Co., Richmond, Va., with bitulithic, \$2.12 per sq. yd.; company's bids as follows on (a) stone headers, (b) concrete curb, (c) concrete sidewalks, (d) granite curb, (e) laying vit. pipe, 12-in., 18-in., 20-in. and 21-in.; West Construction Co., (a) 49c. per lin. ft., (b) 69c. per lin. ft., (c) 74c. per sq. ft., (d) 60c. per lin. ft., (e) 39c., 49c., 53c. and 65c.; company also bid \$1.95 on sheet asphalt, \$1.95 on asphaltic concrete and \$2.24 on bitulithic; Atlantic Bitulithic Co., (a) 55c., (b) 58c., (c) 16c., (d) 76c., (e) 40c., 45c., 52c. and 60c.; John J. Cain, (a) 38c., (b) 48c., (c) 13c., (d) 52c., (e) 18c., 23c., 28c. and 33c.; company also bid on vit. block paving, \$2.48 for So. clay, \$2.83 for Mack brick and \$2.86 for Metropolitan; Palmetto Paving Co., (a) 60c., (b) 62½c., (c) 97½c. per sq. yd., (d) \$1, (e) 41c., 53c., 57c. and 71c.; company also bid \$1.73 on bituminous concrete; Weston & Brooker, (a) 75c., (b) 47½c., (c) 14c., (d) \$1.40, or \$1.90 for curve, (e) 50c., 66c., 76c. and 95c.; approximate quantities, 24,000 sq. yds. of brick, 19,000 sq. yds. of wood block and 38,000 sq. yds. of bitulithic.—John McNeal, City Engineer.

SEWERAGE

Guthrie Centre, Ia.—Installation of sewerage system is being considered.
Somerville, Mass.—Mayor Burns has recommended \$20,000 appropriation on funded debt account for sewer construction.

Dallas, Tex.—City Commissioners will ask for bids for building 6-in. sanitary sewer on Fifth st., Jefferson to Bowling.

CONTRACTS AWARDED

Bridgeport, Conn.—Building sewers: Putnam st., to Pierce Mfg. Co., 92c. per ft.; Hanover st., to B. D. Pierce, Jr., Company, 73c.; Vine st., to same, 88c.; Westfield ave., to Burns Co., \$1.67.

WATER SUPPLY

Wilcox, Ariz.—Finance Committee on artesian well proposition has elected committee consisting of A. Redus, Dr. Wilson, Tom Fughum, A. I. McAllister and H. A. Morgan to make necessary arrangements and drill the well.

Dodge Center, Minn.—Citizens are considering election on construction of water works system.

Anselmo, Neb.—Citizens will vote Apr. 25 on \$7,500 bonds to install water works system.

Clay Center, Neb.—Citizens have voted \$5,000 bonds for installation of water works system.

Milford, Neb.—Citizens have voted \$13,000 bonds for installation of water works system.

Fargo, N. D.—Council has decided to locate water purification plant just outside the southern limits of city.

Lott, Tex.—Citizens have voted \$14,000 water works bonds; city will take over private system, expand and operate it.

Altoona, Wis.—Chippewa Valley Railway, Light & Power Co. has been granted franchise to install water works system.

LIGHTING AND POWER

Glenwood, Ia.—Council has ordered that all telephone and electric light poles be removed from around square; this is a preliminary step toward introduction of electric lighting system.

New Market, Ia.—Citizens will vote May 1 on granting franchise to Lee Electric Co. for installation of electric light plant.

Philadelphia, Pa.—Bids will be invited by Department of Public Safety through Electrical Bureau for installing 148 new lights and rehabing 42 now in service on South Broad st. boulevard.

Baraboo, Wis.—Citizens have voted \$4,000 bonds for lighting plant.

Monterey, Mex.—Council is considering installation of its own power plant.—D. Fernult Martinez, Mayor.

FIRE EQUIPMENT

Pasadena, Cal.—Citizens will vote Apr. 28 on \$18,000 bonds to purchase auto fire engine and hose wagon for Mentos st. department and to complete hose house.

Honey Brook, Pa.—Honey Brook Fire Company is considering erection of \$5,000 public hall.

Scranton, Pa.—Chairman F. W. Zizelm of Common Council, has appointed D. Jones, of Seventeenth Ward; John Lewis, Fifteenth Ward, and William Murphy, Twenty-first Ward, members Councilmanic Committee to take up question of equipping fire houses.

MISCELLANEOUS

Passadena, Cal.—Citizens will vote \$170,000 bonds to purchase and improve parks and playgrounds.

Brooksville, Ky.—Bracken Fiscal Court has ordered election on \$35,000 bonds erection of court house.

Marblehead, Mass.—Architect William Quiner, Jr., has submitted to Selectmen plans for remodeling of the police station.

Somerville, Mass.—Mayor Burns has commended following appropriations funded debt account: Auto police patrol ambulance, \$4,000; building of public bus, \$65,000, and recreation field at Alew brook, \$15,000.

Buhl, Minn.—Council has decided to erect town hall this summer.

Caledonia, Minn.—Citizens have voted \$6,000 bonds to erect town hall.—C. Trask, Town Clerk.

Longview, Tex.—Citizens have voted \$2,000 bonds for improvements.

CONTRACT AWARDED

Reading, Pa.—Scraping and cleaning of unpaved streets, to Harrison S. Harman; Streets 80 feet wide, \$5.94 a square foot, 60 ft., \$4.74; 40 ft., \$4.74; 20 ft., \$4.

Fort Wayne Watt-Hour Meters

Seldom
Require Repairs

but they are built so that if it is ever necessary to replace a worn or injured part it can be done by one of your own men with practically no loss of service. The jewel bearings and pivots are standard in all meters and can be easily removed and others quickly put in.

The rotating parts may be lifted out as a unit and replaced without disturbing the calibration or any of the calibrated parts of the meter. This makes it possible to inspect practically all of the interior parts with a minimum amount of labor.

These are only a couple of the many reasons why the most enthusiastic users of Fort Wayne Meters are those who have previously had experience with other kinds.

Bulletin 1125 will interest you if you have meter troubles.

SQUAW CREEK IMPROVEMENT

Rectifying a Stream in Lawton, Oklahoma—Open Conduit Lined with Reinforced Concrete—Forms for Concrete Lining—Expansion Joints—Iron Railing—Bridges at Street Crossings

By Z. M. SCIFRES, City Engineer

THE city of Lawton, Okla., with a population of about 10,000, drains into Squaw creek, a stream about twenty-five feet wide and six feet deep where it winds its way snake-like through and across the southern portion of the city. The ground is flat on each side of the stream back for an average distance of about 600 feet. The greater part of the city lies north of Squaw creek on a gradually sloping hillside, rising about 80 feet to the mile; while the rise on the south side is much greater yet gradual.

The drainage area of this creek above the city is approximately 4,000 acres. The outlets for the storm water sewer system for the entire city were made into the old channel of Squaw creek; one outlet (a 48-inch brick sewer) emptied into the old creek a short distance below the west boundary of the city, and the other outlet (a 62-inch brick sewer) was designed to empty farther down the stream near the east boundary line.

On account of the very tortuous course of this creek, its uneven bottom and the obstruction to flow through the channel due to rubbish, brush, etc., frequent overflows occurred during heavy rains, doing much damage to the surrounding property and shutting off that portion of the city lying on the north from the main part during such overflows. And during the dry season pools of water were held by low places in the bottom of the creek and these, becoming stagnant, created a condition very menacing to the health of the neighborhood.

After many complaints from the citizens suffering these inconveniences, an attempt was made to partially remedy the condition by straightening the course in the extreme cases and filling the pools at as little expense as possible. But this was of no avail and it was soon found that an improvement of a more permanent nature was absolutely necessary, as that portion of the city lying along this stream was becoming very valuable on account of its closeness to the business center.

About four years ago bonds were issued to improve Squaw creek, but the amount of the issue was found insufficient to meet the demands and, because all the property could not participate of the benefits to come from the expenditure of this amount, some dissatisfaction arose over the proposed improvement and the whole affair was dropped at that time. A second

and bond issue of \$40,000 was voted about a year ago and plans were made to cover as much of the improvement as possible with this issue.

The city engineer was placed in charge of this work. Cross sections were taken 25 and 50 feet apart on various routes and all information as to existing conditions was obtained. It was decided after thorough investigation that the route should be along I avenue, from that point where the creek touched the avenue between Second and Third streets to the point where the creek crossed the avenue between Eighth and Ninth streets, and beyond each end of this stretch the route would follow the general direction of the old channel of the creek, making the course as straight as possible. The street grades on I avenue and all cross streets had been previously established so that all street drainage was to the avenue, making this the proper route to be selected.

A plan was adopted for an open conduit with bottom and sides of concrete, reinforced and 6 inches thick. This conduit is 11 feet wide at the bottom and 16 feet wide at the top, both inside measurements. The depth varies with the grade of the street alongside of the conduit, being 6 feet at the minimum and 7.8 feet at the maximum, the average being about 6.5 feet. The total length of work so far constructed is about 3,500 feet. A number of streets intersect Avenue I and at each of such intersections a bridge spans the conduit, the bridges being sufficiently wide to include both roadway and sidewalks. These bridges are of steel beam and concrete arch construction. The conduit opening is guarded by a railing constructed along the top of each wall and continuing unbroken along each side of each of the bridges. This consists of posts and two rails of two-inch gas pipe, the posts being set into the concrete curbing which forms the top of the conduit lining.

At each bridge provisions were made for catch basins and outlets for future storm sewers. In addition to these, outlets were provided at various places for the purpose of draining water from the old channel; these outlets being planned as a temporary arrangement only, to be abandoned when the old creek bed has been filled up. Avenue I is 80 feet wide, and an ordinance was passed establishing the tree lines, sidewalk lines and curb lines so that there would be a driveway approxi-

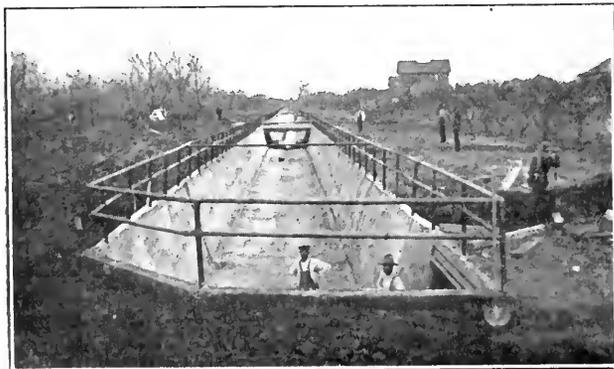

FORMS FOR CONDUIT WALLS IN PLACE
Outside forms braced against bank.

mately 17 feet wide on each side of the conduit. The tops of the concrete walls extend three inches above the crown of the street, forming a curb in the same manner in which a center parking in a roadway is enclosed.

The plans were approved by the Mayor and Council, and the contract was let to E. R. Kerby, a local contractor. Work on actual construction began about the first of last November, and was finished the latter part of January, excellent weather conditions permitting the work to be carried on at a very rapid pace.

Earth from the excavation was deposited along the banks of the old creek and in some places even in the old channel, which crossed and recrossed the conduit in three or four places. Some risk was taken in filling the old channel, but connections between the stream and the new conduit were made in ample time to avoid damage from floods due to the obstruction of the old channel.

A varying depth of conduit combined with a constant width at both the bottom and the top, resulting in a varying slope at the sides, made it somewhat difficult to design a form to be used in the construction of the concrete walls. This difficulty was overcome by making the form for the inside of the walls in two sections, so that a slight change in the batter could be made in the upper half to secure the necessary width at the top of the walls. These forms were made in 12-foot sections and consisted of 1-inch tongued and grooved boards, nailed to 2 x 4 vertical strips spaced 4 feet apart, two strips being placed about 2 inches apart at intervals and the struts being slipped into the slots thus formed. Each section of the form was about 4 feet by 12 feet and could therefore be easily handled. To hold these in place a set of standard cross struts was made for the bottom set of forms, these consisting of two horizontal 2 x 6's and three pairs of vertical 2 x 4 strips so nailed to these as to hold them parallel and about 3 feet apart. The ends of the strut pieces were then cut on the proper bevel so that, when slipped into the slots on the forms previously described, it held these at the proper distance apart

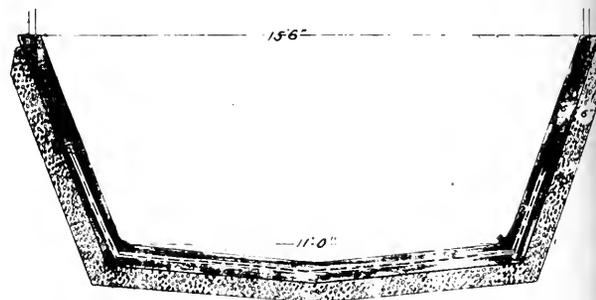

COMPLETED CONDUIT
Taken at bend in conduit. Shows railing and bridge a block away.

and at the proper batter. As the upper section of the form varied in batter from section to section, the struts for the walls were made in much the same way except that the upper and the two horizontal pieces was adjustable in its length, thus permitting the tops of the upper form sections to vary in the distance from each other. These struts were found to hold the wall forms very rigid.

The sides of the excavated ditch were trimmed so as to be used as the back form for the concrete lining. The soil was a "gumbo" and was found in excellent condition for serving this purpose. In some cases the banks were low and back lagging was necessary, this being braced against the surface of the ground. In most cases this back lagging was removed before the back-filling was done, the concrete standing on itself until the back-filling could be placed. In extreme cases back lagging and the 4 x 4 braces were left in place, in most cases the lagging being removed and the braces only being left.

The forms were not greased or otherwise treated, but the concrete was never any trouble from the concrete adhering to the forms. The forms were carefully swept off each time before being used again. They were usually removed about the third day after the concrete had been placed. Any rough places or honeycombing which appeared upon the surface of the walls were then plastered up with cement mortar. The bottom of the conduit was constructed in advance of the walls.

The concrete was mixed by a machine mixer which was moved along the side of the conduit and discharged the concrete through an inclined trough into hand carts which carried it to its place in the bottom or walls. During the construction of the walls runways for the wheelbarrows were supported by the struts which braced the wall forms.

SECTION OF CONDUIT AT EXPANSION JOINT
Inner section is conduit; outer section is support for expansion joint

At intervals of 100 feet expansion joints were left in the concrete lining. These were one inch wide and were made by inserting a board between two sections of concrete, which board was afterward withdrawn and the space filled with asphalt filling. This joint was continuous across the entire section of the concrete lining. Under the joint was placed a 6-inch concrete slab which lapped 2 1/2 inches under each section of lining. These slabs were constructed in advance of the lining proper.

By means of wooden pins set in the concrete coping of the side walls, holes were left for the gas pipe posts of the railing. A crew cut the pipe and set the railing after the concrete walls had hardened fully to permit this work. A second crew followed which did all the remaining back-filling, grading and placing the work in a presentable condition.

Since the conduit has been completed the old channel has been filled and the property once taken up by old Squaw Creek is being reclaimed and improved extensively. It is proposed to extend the conduit to take the place of the tortuous channel where it winds the remainder of its course through the city.

The contract prices of this work were as follows: Concrete, \$7.00 per cubic yard; earth excavation, 26 cts. per cubic yard; reinforcement, 4 cts. per pound; bridge steel, \$63.90 per ton; corrugated metal, \$14.00 per square; 3-inch field tile, 15 cts. per foot; 2-inch gas pipe, 18 cts. per foot. The total cost of this improvement was \$39,833.

MUNICIPAL IMPROVEMENTS IN MEXICO

Encouraged by Federal Government—Practically All by United States Contractors—Water Supply a Difficult Problem—Paving and Gas

By W. D. HORNADAY.

The construction of quite a number of municipal works and improvements in different cities of Mexico is being held in abeyance pending the settlement of the existing disturbed conditions due to revolutionary uprisings in various localities.

It was not so many years ago that Mexico entered upon an era of municipal betterments. Prior to that time there had been practically no attention given to the establishment of modern public utilities in the different cities and towns. Even those having a population of several hundred thousands of people, such as the capital of the republic and Guadalajara, were primitive in the type of their municipal works. The federal government of Mexico is largely responsible for the general interest that is being taken in the establishment of modern municipal improvements in the different communities. It has been the policy of the government to bear a part if not all of the expense of constructing a certain character of municipal improvements in the coast cities. This paternal spirit had its origin through the necessity of making the gulf ports as well as those on the Pacific side of the country as sanitary as possible and to free them of the possibility of yellow fever and other diseases to which they had formerly been subjected. The government during the last ten years has spent many million dollars in the construction of sanitary and sewer systems as well as water-works plants and distributing systems in the cities of Vera Cruz, Tampico, Coatzacoalcos, Salina Cruz, Manzanillo and Mazatlan. Through these expenditures of federal funds, augmented by appropriations made by the different states in which the cities concerned are situated, there has been brought about a complete transformation of these deepwater ports. Their health conditions have been brought up to a high standard. Yellow fever and other contagious diseases, due to unsanitary conditions that formerly prevailed in these places, have been practically eliminated. With the inauguration of these public utilities have come other municipal improvements, such as street paving, surface drainage, the establishment of parks, driveways and the construction of new sidewalks and a variety of other pleasing features that go to make up a town of complete modernness.

Following the example set by the federal and state governments as to these deepwater ports the municipal authorities of interior towns set about making similar improvements with the result that a great deal has been accomplished along this line during the last few years, but there remains an enormous amount of improvements in the way of establishment of public utilities, street paving and sidewalk construction still to be done.

It is a notable fact that practically all of the construction of these municipal enterprises has been done by American contractors. Exceptions to this rule are in the cities of Vera Cruz, Coatzacoalcos and Salina Cruz, where the work was carried out by a British contracting firm. The material for the sewers in the different towns has come chiefly from the United States, as has also the machinery for the water-works plants and equipment that is necessary in carrying on the works of improvement. The asphalt and brick that are used in paving streets and laying sidewalks are native products.

While the municipal improvements so far have been confined to the larger cities it is expected that with the further development of the country the smaller towns will join the upbuilding movement, thus affording splendid opportunities for the further sale of American-made machinery.

Among the interior cities that have made extensive municipal improvements during the last few years are Monterey, which has been equipped with complete water-works and sewer systems at a cost of about \$5,000,000; Chihuahua, which has

also been supplied with these public utilities; Torreon, Zacatecas, Guadalajara, Hermosillo, Merida, Puebla and Durango. There are a number of towns of considerable size which have under consideration the establishment of municipal works, among them being Saltillo, San Luis Potosi, Aguas Calientes, Parral, Culiacan, Tepic, Oaxaca, Toluca, Irapuato, Campeche, Chilpancingo, Cuernavaca, Morelia, Jalapa, Nuevo Laredo, Queretero, Guanajuato, Victoria, Pachuca and Colima. These towns range in population from 15,000 to 45,000, and while several of them are already equipped with water-works systems of more or less primitiveness there remains a great amount of other improvements to be made to bring them up to the standard of the other cities of the country that have already adopted the policy of modern improvements in their public utilities.

Perhaps the most notable feature of the work of advancement of the cities of Mexico is street paving. An enormous amount of this character of work has been done during the last few years. This is particularly true as to the City of Mexico, Guadalajara and Vera Cruz. In Monterey considerable street paving has been done and arrangements are now being made to extend this improvement to all of the streets in the business portion of the city and into the residence districts. The original paving in Monterey, covering several blocks in the heart of the city, was done several years ago, vitrified brick being the material that was used. It is now purposed to use asphalt for the new paving that is to be put down. In San Luis Potosi and Chihuahua there has also been done a considerable amount of street paving, thereby adding wonderfully to the good appearance of those cities.

One of the difficult problems for most of the larger cities of Mexico, particularly those that are situated upon the arid central plateau, is that of providing an adequate water supply. In Monterey this difficulty was overcome by the construction of a great reservoir some distance from the city which is supplied by wells and the water is brought down to the distributing system by gravity. In Durango a similar method is in operation for obtaining the water supply, the main reservoir being situated close to and high above the city. Great difficulty was experienced in developing the water supply for the cities of Zacatecas and San Luis Potosi, but it was finally overcome and the water supply is now ample for all the needs of the people of those places. Where underground flows can not be found it is usually practical to obtain the necessary supply by the construction of storage reservoirs, by which means the flood waters are gathered. Many of the larger towns of Mexico are not situated upon or near running streams of water, and this adds to the difficulty in providing ample and permanent supply for such places. The installation of a water supply and distributing system for the City of Mexico has been in progress for several years and is still lacking a great deal of being finished. It is estimated that an additional expenditure of \$10,000,000 will be required to carry out the plans that have been adopted for the big municipal enterprise.

The industrial development and rapid growth which the capital and other cities of the country have taken on within the last few years are creating a constant necessity for enlargements and further improvements to the existing public utility plants.

Municipal ownership of electric light and power plants and systems has not found favor in Mexico, although in a few instances these concerns are owned and operated by the cities.

It is only within the last year that the introduction of gas for municipal use in Mexico has been accomplished. An American concern headed by E. L. Doheny of Los Angeles, Cal., recently completed the installation of a gas plant and distributing system in the City of Mexico, and the establishment of a similar plant in Guadalajara by an American syndicate is now in progress. A syndicate of Canadians headed by William Mackenzie of Toronto has been granted a franchise for installing a gas plant and distributing system in Monterey. It is expected that similar enterprises will be inaugurated in other cities of the country within the next few years.

DETERMINING YIELD OF WELLS

Law of Flow of Ground Water into Wells—Methods of Making an Actual Test and Results Obtained

Paper before the Illinois Water Supply Association by Arthur N. Talbot, Professor of Municipal and Sanitary Engineering, University of Illinois

It is well known that the yield of a well (in other words, the rate of flow into the well) depends upon the depth to which the pumping lowers the water below its normal level, provided, of course, that the general level of the water at a distance from the well, or its pressure in the case of artesian wells, is not lowered by the pumping. The principles of hydraulics may be applied in the analysis of the rate of flow, the spaces in the porous earth between particles acting as small tubes, and the general relation between head and yield are susceptible of expression by mathematical formulas. However, the complexity of the formulas and the uncertainty of information on size of grain and porosity in the water-bearing stratum usually make us hesitate to accept the formulas. This paper describes a simple instance where the measurement of the inflow into a well illustrates the analytical law of flow into wells.

Wells may be classified for our purpose as (1) "non-artesian," defined as those in which the level of the water in the well is below the top of the porous stratum which carries the water to the well and (2) "artesian," defined as those in which the water in the well remains above the top of the porous stratum and in which this stratum is overlaid with a relatively impervious one. The terms "non-artesian" and "artesian" are here used in a broad sense for want of better terms. The analysis of the yield of these two classes of wells is somewhat different. In the first the water actually stands in the porous layer at the level which produces the flow. In the second the water-bearing stratum remains filled and is under a varying head or pressure.

Class No. 1.—*Non-artesian Wells.*—The porous water-bearing layer extends at least from the general level of the water to a point at or above the bottom of the well. (See Fig. 1a.) The formula for yield of well or rate of flow may be shown to be as follows:*

$$Q = k' \frac{H^2 - h^2}{\log \frac{R}{r}}$$

where r is the radius of the well, R is the distance to a point where the level of the water in the ground is not sensibly lowered, H and h are shown in Fig. 1, and k' is a coefficient depending upon the size of grain and porosity of the ground and upon other conditions. The formula for y may also be obtained.

The above formula shows that as the water is lowered in a well the yield increases at first very rapidly, then more slowly until the water is pumped down to the bottom of the water-bearing layer. Fig. 1 (b) illustrates the changing rate of yield. It is seen that when the well is pumped down one-quarter of the depth, the yield will be over 50 per cent of the maximum yield: i. e., over half of the yield when the water in the well is lowered to the bottom of the water-bearing stratum. When the water is down to one-half of the depth, the yield is 75 per cent of the full yield. This relation may not represent the exact conditions of flow, but it expresses a general principle. The analytical formula by which k' is determined (not given here) is of interest in showing the effect of porosity and size of grain upon the yield

*See Turneure and Russell's "Public Water Supply" for the derivation of this formula.

and also in assisting the judgment in an estimate of the yield of a well under different conditions.

Class No. 2.—*Artesian Wells.*—A porous water-bearing stratum is overlaid with a relatively impervious layer, and the water-bearing layer is under pressure. (See Fig. 2a.) A similar analysis to that used in deriving the formula in the previous section may be used for this class, resulting in the following formula:

$$Q = 2k't \frac{H-h}{\log \frac{R}{r}}$$

or

$$Q = mz$$

where k' is a coefficient depending upon the porosity and size of grain of the water-bearing stratum, t is the thickness of the water-bearing stratum, r is the radius of the well, R is the distance to the point where the pressure upon the water-bearing stratum is not changed sensibly by the pumping, H and h are shown in Fig. 2, z is the distance the water is pumped down from the level of the well, and m is a coefficient for any given well as determined from the first equation. The time required to fill the well between the level H and z may be shown to be $f(\log H - \log z)$.

An important deduction from the equation $Q = mz$ is that the yield varies as the depth the water is pumped down. That is to say, if the yield when the level in the well is 50 ft. below the normal level is a certain amount, the yield when the water is pumped down 100 ft. would be twice as great, and when pumped down 200 feet would be four times as great. This has an important application to deep wells generally. Of course it is here assumed that the general water level remains constant and that the water is not lowered below the top of the water-bearing stratum. The loss of head into the well and, in the case of deep wells, the loss through the well itself must be allowed for.

TEST OF A WELL OF THE ARTESIAN CLASS

In the well here referred to (see Fig. 3a) the excavated part of the well was 16 ft. in diameter and about 30 ft. deep.

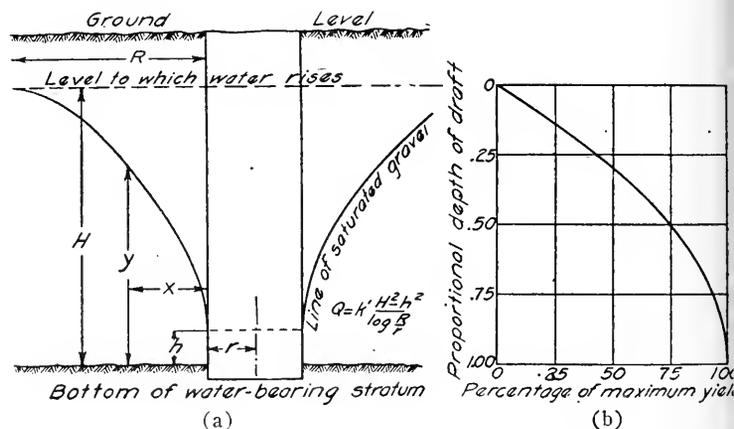

FIG. 1. FLOW IN NON-ARTESIAN WELLS

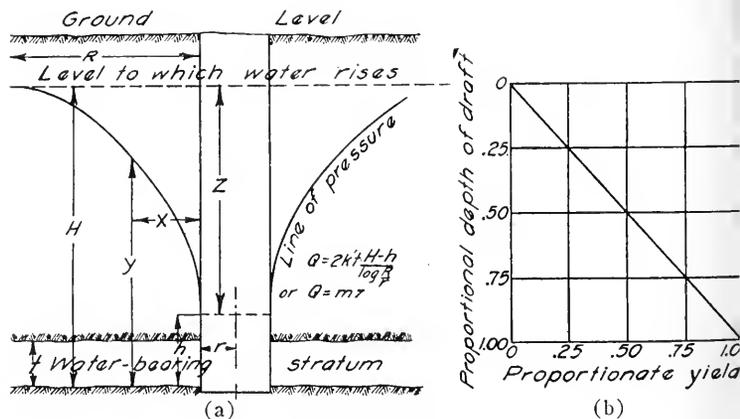

FIG. 2. FLOW IN ARTESIAN WELLS

From the bottom of this a 6-in. tubular well extended down to a depth of about 120 ft., passing through relatively impervious earth to the water-bearing stratum. When not drawn upon the water would rise to within one foot of the surface of the ground. This gives the conditions of artesian flow. The problem was to find the rate of inflow at any given level of water in the well. The following simple plan was used:

The well was pumped down until the water was, say, 20 ft. below its highest level, the pump stopped and the distance of the water below the well platform measured by a city employee at the time of day noted. At four or five times during the next twelve hours the distance down to the water level was measured and the hour noted. With these data before me and knowing the diameter of the well, it was easy to find the constants to use in the formula before given. The formula becomes:

Yield in gallons per 24 hours, $Q = 3,250 z$,
 where z is the distance below the highest water level for the point at which the rate of flow or yield is determined. When the water stands 10 ft. below its highest point the inflow is at the rate of 32,500 gallons in 24 hours. The formula for time required for filling between levels H and y becomes

$$T = 11 \frac{1}{2} (\log_e H - \log_e y),$$

the symbols as before.

The diagram, Fig. 3b, shows that these results follow closely the theoretical or analytical conditions.

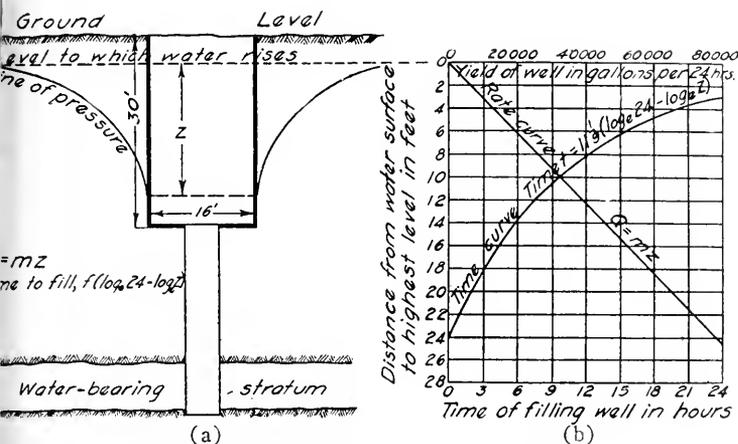

FIG. 3. DIAGRAM OF WELL TESTED AND RESULTS OF TEST

A word as to the applicability of this test. The city wanted to increase its supply. Several propositions for increase had been made. It was a question whether another tubular well could be put down, or whether the wet well should be deepened, or the method of pumping changed from operating the pump an hour twice daily to pumping for a short period several times daily, or whether to lower the pumps and pump continuously. Much misinformation had been given me on the amount of water pumped, the distance the water was commonly pumped down, and the time it took the well to fill. The simple test threw much light on the actual conditions of operation and gave trustworthy information bearing on the best method of securing a larger supply. It not only illustrates the law of flow into wells, but it may suggest the desirability of making tests of existing plants before extending the well system.

RUST IN SERVICE PIPES

The following caution by Superintendent of Water Works George H. Snell, of Attleborough, Mass., may be applicable in other cities. The supply is from wells pumped to a standpipe. Superintendent Snell said, in his report for 1910:

I wish at this time to warn those who are building or piping houses to avoid the use of galvanized iron pipe or galvanized range boilers if they wish to prevent rust in water, which invariably is caused by galvanized pipes. It is a well known fact that the town water acts on galvanized or lead pipe. The department, in their part of the service, use cement and tin-lined

pipe, and if the same or some other non-corrosive material were used inside the house the rusty water would be eliminated. The rust is more noticeable during the months of August, September and October, when the temperature of the water is the highest, and for this reason the rust is more noticeable in the hot water fixtures than in the cold.

DISINFECTING SWIMMING POOLS

Experiments on the Use of Chloride of Lime for This Purpose—Danger of Infection Removed—Economical Advantages

By MELVILLE C. WHIPPLE

Condensed by the author from a paper read before the Chemical Society of the Brooklyn Polytechnic Institute, February 18, 1911.

In view of the importance which is being attached to the sanitary control of swimming pools, and the general lack of definite information in regard to their bacteriological contents and the means of keeping the bacteria within safe limits, a series of experiments was conducted during the past year to provide data and information along this line. More particularly was it desired to determine the value of chloride of lime, or bleaching powder, in this connection.

There can be no doubt that in the ordinary swimming pool there lies a means of spreading infection and disease which in the past has been generally disregarded or underestimated. More commonly this infection occurs in the form of colds or annoying disorders of the respiratory tract. Individual cases and even epidemics have been brought to the attention of the author, which it was perfectly reasonable to expect had their origin in the use of an unsterilized pool. Swimmers suffering from these affections and even those who are not visibly inconvenienced thereby, consciously and unconsciously emit portions of mucous secretions containing thousands of bacteria. Many forms of bacteria that are commonly found on the skin and in the nose, mouth, and throat, depend for their harmful effect merely upon a depressed condition of vitality. While not as great, the danger likewise exists of contracting venereal diseases, and diseases of the intestinal tract,

such as typhoid and dysentery.

The ideal water for swimming purposes, from both the aesthetic and hygienic standpoint, is an artesian supply, abundant in quantity and low in bacteria and organic matter; but a very large number of swimming tanks are necessarily supplied with water which does not conform to such a standard. The experiments with which this article is concerned were conducted upon the tank in the gymnasium of the Brooklyn Polytechnic Institute. This tank is lined with white tile, has a capacity of approximately 25,000 gallons, and is supplied with Brooklyn city water. It has been customary to fill it twice a week with fresh water, maintaining a circulation between times through a heater, and adding fresh water only in the emergency of leakage or of high temperature.

Five separate runs or series of experiments were made, both with and without the use of chloride of lime. Samples were taken each day from the deep and the shallow ends of the pool, and determinations made of turbidity, free and albuminoid ammonia, total bacteria at 37 degrees C. and 20 degrees C., and a presumptive test for the *Bacillus coli communis* which occurs in the intestinal tract. Temperature and other general observations were made at the time of the collection of samples. During the course of each run the tank was not emptied, nor was fresh water added in any appreciable quantity. In a period of five or six days, the time usually occupied by one run, the turbidity rose from 1 to 4 or 5 parts per million. Free and albuminoid ammonia values also increased, the proportion of free being relatively greater when the number of bacteria was greater. The growth of the latter did not show regular pro-

gressive changes but appeared to vary considerably from day to day. This might have been due to differences in the available food supply, variation in temperature or from outside causes. The question of temperature evidently plays an important rôle in the bacteriological contents of a swimming pool. It was repeatedly found that a temperature above 75 degrees brought about a marked and a sudden rise in the number of bacteria. This fact has also been noted by other observers.*

Below is given a partial list of results obtained from analyses made during Run No. 1 when no disinfectant was used, Run No. 4 when a half pound of chloride of lime was added on every other day, and Run No. 5 when one-fourth pound was added each day.

Run No. 1
No Disinfectant Used.

	PARTS PER MILLION OF NITROGEN AS		AVERAGE DAILY NUMBER OF BACTERIA PER C.C.		B. COLI.		
	Free ammonia	Albuminoid ammonia	Agar at 37°C.	Gelatine at 20°C.	0.1 c.c.	1.0 c.c.	10.0 c.c.

Tenth day P.M.....	.130	.166	0	0	0	0	0
(After dosing).....

*Less than 25 bathers between the fifth and eighth days.

Run No. 5

Using 1/4 lb. chloride of lime (10 lbs. per million gals.) every morning

First day A.M.....	.056	.054	550	4,000	0	0	+
(After dosing) P.M.....	.074	.078	0	18	0	0	0
Second day P.M.....	.070	.080	65	185	0	0	0
Third day P.M.....	.126	.088	2,800	5,500	0	0	0
Fourth day P.M.....	.130	.112	90	1,350	0	0	0
Fifth day P.M.....	.152	.140	35	1,500	0	0	0

It will be noticed from an inspection of the results of Run No. 1 that the highest number of bacteria developed suddenly on the third and fourth days, falling off perceptibly on the days following. This was not due to any great variation in the number of bathers, which averaged 75 for each day of the test. *B. coli* were always present in 10 c.c. of the water, and on the days of the highest counts were present in 1 c.c.

The choice of chloride of lime as a disinfectant was made because of the many advantages this substance possesses over others. Its action upon bacteria is immediate and fatal. The destructive effect has generally been thought to be due to the action of nascent oxygen released from the water by the chlorine, although there is some opinion that the chlorine acts directly upon the organisms. Excellent results have been obtained by the use of this reagent in the treatment of sewage and the purification of water supplies. Furthermore, small quantities accomplish the desired end, and any excess of chlorine which remains is used up in the oxidation of organic matter or iron, both of which are liable to be present. Another advantage of chloride of lime is its low cost. It was not found practicable to add the disinfectant in dry form owing to the dust created and the amount of fine material which afterward floated upon the surface of the water. It was dissolved in about two gallons of warm water and the solution mixed with the contents of the tank.

*Burridge, Pro. Indiana Acad. Science, 1909.

The effect of adding chloride of lime every other day in the proportion of 20 pounds per 1,000,000 gallons is seen in Run No. 4. In spite of the disadvantage of starting with water containing a large number of bacteria, good conditions were restored and maintained for five days. The strong sterilizing properties of the disinfectant are well illustrated from the results obtained during the latter part of this run, when the accumulation of organic matter allowed rapid bacterial growth after the excess of chlorine disappeared. Reducing the quantity of chloride one-half and adding it upon each day maintained a fairly satisfactory condition of the water, as seen from the table under Run No. 5. This amount, however, could hardly be considered sufficient to hold in check any sudden increase in bacteria which might occur from unusual contamination; nor did it maintain the generally low average of the first five days of the previous run.

Tests were also made using 2 pounds and 1/2 pound weekly but the efficiency of these quantities was lower, and there was the added disadvantage, in the case of the larger quantity, of a distinct odor and taste of chlorine, which remained in the water for three days. The application of 1/2 pound on every other day, that is in the proportion of 20 pounds per 1,000,000 gallons of water, of which 35 per cent was available chlorine, gave rise to a very slight odor, which was not objectionable and which disappeared in a very few hours.

A general consideration of this subject, based upon the results obtained, offers substantial evidence that a swimming pool operated under the conditions described, without the aid of disinfecting agents, and subject to the contamination incident to general use, has the hygienic qualities of its water imperilled and provides an environment favorable to a sudden and rapid growth of bacteria. Many of the forms ordinarily regarded as the index of dangerous pollution of water were shown to flourish in these surroundings. *B. coli* and other gas producing organisms were constantly found to be present in Run No. 1, which involved no chemical treatment. Their reappearance after sterilization had been accomplished aptly illustrates how they are introduced by bathers. The degree of efficiency of chloride of lime in moderate doses to check these growths is quite evident from the figures presented. As regards the possibility of harmful effects arising from the use of this substance as a disinfectant, it may be stated that there is no authority available to show that chloride of lime in the quantity used has any physiological action.

There are often economical as well as sanitary advantages to be derived from the disinfection of a swimming pool. As the body of water within the tank can be used for a longer period of time with safety and without deterioration in general attractiveness, a direct saving in water is brought about, and the incidental expenses in connection with the withdrawal of water and subsequent operations of cleaning are eliminated. To demonstrate with a concrete case, that of the tank used in connection with these experiments, it was found that the water remained in a satisfactory condition for a week, if a half-pound of disinfectant was added on every other morning. Previous to its use the water was changed twice a week. Besides maintaining the bathing privilege at all times, there was an actual money saving in dispensing with one change a week which was estimated as follows:

Power for pump in discharging tank contents to sewer..	\$.
Cleaning of tile (labor, etc.)
Coal for heating fresh body of water.....	5 .
Fresh water to fill tank.....	3 .

Total

The expense of treatment is represented by the cost of 10 pounds of chloride of lime, obtainable in packages for ten cents a pound, and by the item of a few minutes' labor in applying the solution. The protection afforded is obtained so simply and cheaply that the practice ought to be more prevalent; and there is every evidence that it will be in the future, as serious interest is being very generally aroused on the subject.

City Information Bureau

In every city where the public officials exceed in number
 the mayor, council, and superintendents of roads, sewers and
 water works, there is in the minds of most of the citizens an
 uncertainty just whom to consult concerning municipal matters,
 either for information or for filing complaints. In the largest
 cities, even a considerable number of the officials themselves
 are ignorant as to just what responsibilities and duties come
 within the scope of the several municipal departments. This
 uncertainty not only causes considerable inconvenience to the
 citizens themselves and interferes with their obtaining the
 remedy of abuses or the information to which they are justly
 entitled, but it is an annoyance to the municipal officials them-
 selves in that they are being continually called up by citizens
 with reference to matters which are not within the scope of
 their duties.

A remedy for this condition in the Borough of Manhattan,
 New York city, is recommended by Borough President Mc-
 Aneny, who proposes a city information bureau, to which

citizens may apply for information of any kind concerning
 municipal business or affairs, and to which also would be sub-
 mitted all complaints. The clerks in this bureau, if they could
 not at once answer the questions, would be supposed to know
 what department to apply to for such information, and would
 obtain the same and forward it to the inquirer. Complaints also
 received by this bureau would be forwarded to the official
 whose duty it is to investigate or remedy them.

We believe that a bureau, or in the case of a small city, an
 official, to perform such services is needed in all cities. In
 villages and other small communities the mayor or village
 president generally acts in this capacity, and probably this
 should be considered as a part of his duties. In larger cities,
 however, the mayor personally should not have his time occu-
 pied with inquiries concerning all sorts of minor affairs, al-
 though his clerk might well be given this as one of his duties.
 As the city becomes still larger, however, it is probable that
 a number of clerks, such as is contemplated for New York
 city, would find their time well occupied in receiving inquiries
 and complaints and attending to the same.

Waste in Public Water Consumption

We have had occasion several times to call attention to the
 fact that no class of consumers waste more water than schools
 and other municipal buildings and that consequently meters or
 other methods of restricting waste are fully as important here
 as on any other services in the city, in spite of the seeming
 anomaly of a city's measuring the water which it delivers to
 itself.

An illustration of this is furnished by the city of New Bed-
 ford, Mass. During the year 1910 there was metered and
 charged to the schools, engine houses, police stations, city hall,
 library, almshouse, city stables, cemeteries, parks, wharfs and
 electric car sprinklers 88,809,000 gallons. In addition, metered
 water was supplied for drinking fountains, extinguishing fires,
 flushing sewers, puddling trenches, street operations and water
 department work which is estimated by the superintendent to
 have amounted to 200,000,000 gallons. This total of 288,000,000
 gallons is about one-tenth of the total consumption of the city.

How much water was being wasted previous to the use of
 meters is not known; but all departments now watch their
 meter records and if an abnormal amount is registered they
 quickly locate and remove the cause, while hitherto they have
 concerned themselves very little with leaky fixtures. The school
 department, previous to the installment of meters, had several
 very large motors operating ventilating machines. One of
 these was metered and found to use over 27,000,000 gallons a
 year, and it is fair to presume an equal amount was being used
 by each of the others. When meters were installed at the end
 of 1909, these motors were all discontinued and electricity was
 substituted as a motive power.

The school department now requires all janitors to record
 the meter readings daily on cards, which are sent at the end
 of each month to the superintendent's office. We presume also
 that the janitors are instructed to report at once any abnormal
 increase in consumption continuing for two or three days.

It is apparent that the saving in the water used by the school
 motors alone is more than ample to pay all expenses of meter-
 ing the school buildings. We believe that in practically every
 city where the matter has been investigated it has been found
 that schools are the most flagrant wasters of city water to be
 found.

Steel Pipes for Water Mains

At the monthly meeting of the Birmingham (England) As-
 sociation of Mechanical Engineers, held on March 4, a paper
 was read on welded steel pipes for water mains, etc., of which
 the following is a synopsis:

The most important requirement of a pipe was reliability, by
 which was meant not merely that the pipe must be strong, but
 that the engineer should have a reasonably good idea of just
 how strong it was. Mild steel pipes were at once the strongest
 and most reliable, and were gradually but surely taking the

place of cast iron, not only for water but for sewage and gas mains. Another advantage which the lapwelded steel pipe claimed over cast iron was its increased carrying capacity, the smoothness of the bore reducing the friction, known as "skin friction," between the fluid and the surface of the pipe. This was an important point frequently overlooked or often underrated, but seeing that the capacity of a pipe of a given bore may be more than doubled by substituting a smooth for a rough interior surface, it would be understood that it was a matter worth careful consideration. The smoother rolled surface of the lapwelded pipe took an excellent coating or protective solution having a hard glossy surface. Added to this the pipe was a smooth cylinder from end to end, as there was a complete absence of anything in the nature of rivets, butt straps, or lapped plates. In consequence, the frictional resistance was less, and the velocity and carrying capacity greater with lapwelded than with any other form of pipe. The question of the life of steel pipes had long been the subject of much conjecture, owing to the fact that there were no data on which to base a rule. All that could be said was that the oldest and best-known steel pipe lines were, as far as could be ascertained, in as good condition and as free from corrosion now as when they were laid.

TARRING ROADS AND EYE TROUBLES

By ALBERT SCHEIBLE

One of the reasons for the already widespread use of tar on roads has been the annoyance and the interference with normal vision caused by the dust, which is so much more freely raised by a fast automobile than by a slow vehicle. While such a use of tar and allied compounds has unquestionably been a success in laying the dust, the claim has been occasionally made that the dust raised on the tarred streets was more injurious to the eyes than that free from tar. To test the validity of such claims two French investigators, H. Hruc and C. Fleig, recently made a long series of tests with dust blown into the eyes of rabbits and dogs, using both the dust of untreated roads and that of tarred ones.

They first found that the dust of ordinary roads, no matter whether brushed off the surface of the street or gathered from the air, would not produce eye troubles in rabbits unless its injection was frequently repeated. However, if this dust was rubbed over the eye, it produced a strong secretion of tears and inflamed the eye for a short time. Repeated tests only produced a new inflammation of the eyelids, but in every case this passed away rapidly.

When the same tests were made with dust from tar-treated streets in which the surface already showed wear as the result of long service, the eye inflammation was slightly increased, but otherwise just as with the non-tarry dust. However, on freshly tarred streets or those still in good condition, the eye trouble proved more serious. To ascertain whether the difference was due to the tar, fresh tar was ground up with chalk, pumice or talcum in various proportions and the resulting dust tried on the eyes of the animals. In this case it was found that the seriousness of the inflammation increased with the amount of tar in the mixture. Coal tar alone, when applied to the cornea of the eye, produced much less irritation than if mixed with solid matter; but even such mixture proved less troublesome than the dust from the tarred streets. The reason for this difference was found in the higher bacterial content of the dust off the roads, with which dust such foul matter as the excretions of horses is apt to be mixed.

Tar alone, if applied in sufficient quantity, was found to have an almost etching action on the membranes of the eye, but in the common use of roads the amount of tar getting into the eye would be very small. Under ordinary circumstances the inflammation of the eye would be due to the mechanical grating action of the solid particles in the tar-laden as well as the untarred dust, together with the bacterial action. The latter seemed to be somewhat favored by the chemical action of the tar, but of course the total dust raised from the roads and liable to affect the eyes is very much smaller with the tarred roads than with the untreated ones. Even when ignoring this tremendous difference in the amount of obnoxious dust, the experimenters failed to trace any increase in eye troubles to the use of tar on the roads or streets.

GRANITE BLOCK SPECIFICATIONS

Standard of Association for Standardizing Paving Specifications
—Coal Tar, Asphalt or Cement Grout Filler—
One Year Guarantee

The committee on stone block pavements of the Association for Standardizing Paving Specifications did not complete the preparation of a set of specifications until after the adjournment of the convention, and then but four members could get together. It may be said, therefore, that these specifications are approved by their authors only: B. T. Fendall, city engineer of Baltimore, Md.; M. R. Sherrerd, chief engineer Department of Public Works, Newark, N. J.; S. W. Hoag, Jr., deputy chief engineer Department of Docks and Ferries, New York City; and W. A. Hogue, city engineer, Charleston, W. Va.; although the nature of the stone blocks was passed upon by the convention of 1910. No stone blocks other than granite were included in the specifications, although the committee recognized that other kinds should be provided for.

The committee expressed the opinion that the period of guarantee for granite block pavement "need not exceed one year." "By permission of the association these extracts are reprinted from the copyrighted proceedings of the Association Standardizing Paving Specifications. John B. Hittell, secretary, 5917 Winthrop avenue, Chicago."

SPECIFICATIONS FOR GRANITE BLOCK PAVING

The paving blocks, which shall be of medium grained granite showing an even distribution of constituent material, shall be of uniform quality and texture, without seams, scales or colorations showing disintegration, free from an excess of mica or feldspar, and equal in every respect to the sample in the office of the engineer.

Blocks shall be of the following dimensions, viz.: not more than 8 nor more than 12 inches long on top, not less than 3½ nor more than 4½ inches wide on top, not less than 5 more than 5½ inches deep.

The blocks shall be so dressed that after laying a measurement of the individual joint shall show a width of not more than ⅓ inch at top and for a depth of 1 inch and a width of more than 1 inch in any other part of the joint. The head of the block shall be so cut that it shall not have more than ⅓ inch depression from a straight edge laid in any direction across head and held parallel to the general surface of the block.

Care shall be exercised in handling the blocks so that edges and corners shall not be chipped or broken, as blocks otherwise acceptable may be rejected on account of spalling.

The blocks shall be sorted and laid in courses of uniform width except in special cases, as may be ordered.

Sub-foundation.—Any soft and spongy material below sub-grade shall be removed and filled, as directed by the engineer, with sand, gravel or other material satisfactory to the engineer, and thoroughly rammed or rolled. In excavation care shall be taken not to disturb the sub-foundation, except where necessary to remove the soft and spongy material.

The entire sub-foundation shall be compact and hard and the contractor will be required to thoroughly ram or roll with a roller satisfactory to the engineer unless the latter shall be satisfied that the sub-foundation is sufficiently hard without it.

Concrete Base.—After the sub-foundation has been prepared to the satisfaction of the engineer a concrete foundation of inches thick shall be laid on it. The concrete shall conform with the standard specification for concrete for paving foundations as determined by the Association for Standardizing Paving Specifications.

The grading and sub-foundation shall be completed at least 50 feet in advance of the laying of the concrete.

Cushion Course.—A cushion course of dry, clean sand shall be laid on the concrete base, not less than two inches thick to insure a uniform bearing and prevent the possibility of any part of any block resting directly on the concrete base.

On this cushion the blocks shall be laid as closely as possible, each block touching the adjoining block on sides and ends, in courses of uniform width. All joints shall be broken with a lap of at least three inches.

Filling Joints.—Depending upon the kind of filler to be used in the joints, the following specifications, A, B or C, shall govern the use of coal tar pitch (A), bituminous asphalt (B) or cement grout (C).

(1) *Coal Tar Filler*.—Immediately after the blocks are laid sufficient coarse, hot gravel shall be spread over the surface and swept into the joints so as to fill the space between the blocks to a depth of about one inch from the bottom.

The blocks shall then be rammed to thoroughly settle and compact the first layer of gravel in the joints and so as to leave no blocks above or below the general surface of the finished pavement.

The joints shall then be poured one-half full with a coal pitch filler as hereinafter described and then filled to within one-half inch of the surface with hot gravel and again poured with the filler, this last pouring shall be flush with the tops of the blocks at the joints. The final pouring of the filler shall be immediately followed with a sufficient amount of hot gravel, applied at the joints, to conceal the filler.

The gravel shall be clean, washed gravel between $\frac{3}{4}$ and $\frac{1}{2}$ inch in its largest dimensions, not over 25 per cent of which shall be of the $\frac{1}{2}$ inch size.

The filler shall also comply with the following test requirements:

(1) It shall have a specific gravity between 1.23 and 1.33 at 60° F.

(2) It shall have a melting point between 120 and 130° F.

(3) It shall contain between 25 and 40 per cent of free carbon.

In applying the gravel and pitch care shall be taken that the pavers are closely followed by the filler gang, and in no case shall the paving be left over night (or when work is stopped) without the filler being completed. In case of rain stopping the filler gang before its work is finished the joints shall be protected by the use of tarpaulins or other means so as to keep out water, and under no circumstances shall the filler be poured into wet joints.

(B) *Bituminous Asphalt Filler*.—Immediately after the blocks are laid sufficient coarse, hot gravel shall be spread over the surface and swept into the joints so as to fill the space between the blocks to a depth of about one inch from the bottom.

The blocks shall then be rammed to thoroughly settle and compact the first layer of gravel in the joints and so as to leave no blocks above or below the general surface of the finished pavement.

The joints shall then be poured one-half full with a bituminous filler as hereinafter described and then filled to within $\frac{1}{2}$ inch of the surface with hot gravel and again poured with the filler; this last pouring shall be flush with the surface of the blocks at the joints. This final pouring of the filler shall be immediately followed with a sufficient amount of hot gravel applied at the joints to cover the filler.

The gravel shall be clean, washed gravel, between $\frac{3}{4}$ and $\frac{1}{2}$ inch in its largest dimension, not over 25 per cent of which shall be of $\frac{1}{2}$ inch size.

The paving cement to be used in filling the joints between and around the paving blocks and bridge stones shall be a bituminous material, either natural or artificial, entirely free from coal tar or any product of coal tar distillation.

It shall be waterproof, free from water or decomposition products, shall adhere firmly to the paving stones, and shall remain ductile and pliable at all climatic temperatures to which it may be subjected in actual use, and shall not run in the joints in the hottest temperature of summer, nor become hard or brittle through the action of frost.

It shall conform with the following requirements:

Not less than 99 per cent by weight shall be soluble in carbon bisulphide.

Its specific gravity at 66° F. shall not be more than 1.00.

One hundred grams of this cement shall not lose more than 10 per cent weight upon being maintained at a uniform temperature of 400° F. for seven hours in a cylindrical vessel $\frac{3}{8}$ inches in diameter and 1 inch in height. Its amount of fixed carbon shall not be more than 12 per cent and it shall show a flashing point, with the open oil tester, of more than 310° F., and shall not contain more than 2½ per cent of paraffine scale.

If obtained by a mixture of bituminous materials it shall be a thorough homogeneous mixture free from water and light oils, obtained by agitation with hot air at a temperature of not more than 400° until all the mass is blended completely, and shall be entirely free from any granular accumulation.

At 32° F. with No. 2 needle and 100 grams weight during five seconds the penetration shall not be less than one millimeter.

At 115° F. with No. 2 needle and 50 grams weight during five seconds the penetration shall not be less than eight nor more than fifteen millimeters.

One-half gram of the material when made into a ball shall not melt and drip through an aperture one millimeter in diameter at less than 220° F.

The paving cement shall be heated on the work to a temperature of not less than 400° F., nor more than 450° F., in such quantities as will allow of this temperature being main-

tained in the kettle during progress of the pouring, and no cement the temperature of which is less than 400° F. shall be used.

It shall then be put into a conical can and poured into the joints as hereinbefore described.

It shall be delivered on the work at least one week before being used and in sufficient quantities to allow of suitable samples for examination and analysis, and such samples shall conform with the above requirements.

All the joints between the stones shall be filled with this hot paving cement, continuing the pouring until the joints are entirely filled, but no flushing of the pavement shall be permitted.

In applying the gravel and bitumen care shall be taken that the pavers are closely followed by the filler gang, and in no case shall the paving be left over night (or when work is stopped) without the filler being completed. In case of rain stopping the filler gang before its work is finished the joints shall be so protected by tarpaulin or other means as to keep out water, and under no circumstances shall the filler be poured into wet joints.

(C) *Cement Grout Filler*.—Immediately after the blocks are laid sufficient gravel shall be spread over the surface and swept into the joints so as to fill the space between the blocks to a depth of about one inch from the bottom.

The blocks shall then be rammed to thoroughly settle and compact this layer of gravel in the joints and so as to leave no blocks above or below the general surface of the finished pavement.

After the pavement has been brought to a uniform surface Portland cement grout shall be poured into the joints until it appears on the surface. The grout shall be broomed into the joints, if necessary, to fill the same, and the operation shall be continued as the grout settles until the joints are thoroughly filled flush with the surface of the blocks, immediately after which the entire pavement shall be broomed to a smooth surface, sufficient grout being applied to bring said surface even with the highest part of any of the blocks. The blocks shall be wet by sprinkling immediately before applying the grout if the condition of the atmosphere requires this precaution to be taken.

The cement grout shall be composed of one measure of the best quality of freshly burned Portland cement to one measure of clean, sharp sand. In the mixing of the cement and the sand clean, fresh water shall be used to give the proper consistency.

The grout shall be mixed for this purpose, either in a machine mixer to be approved by the engineer or in a box about 4 feet 8 inches long, 30 inches wide and 14 inches deep, resting on legs of different lengths, so that the mixture will readily flow to one corner of the box, the bottom of which shall be 6 inches above the pavement. The mixture shall be removed from this box to the street surface with scoop shovels, all the while being stirred in the box as the same is being emptied. One such box shall be provided for each ten feet in width of the roadway. The work of filling shall be carried forward until an advance of fifteen or twenty yards has been laid, when the same force and appliances shall be used to re-grout the same space in a like manner, excepting that the proportion of the mixture for this second application shall be two parts of Portland cement to one part sand. The work shall be kept lightly sprinkled with water on the surface ahead of the sweepers by means of a sprinkling can or other suitable device to avoid the possibility of causing the grouting to become too thick at any point. To insure the penetration of the grout into the joints of the pavement there shall be used, in addition to the brooms, a squeegee scraper 15 to 18 inches in length on the last application of the grout.

Within one-half to three-quarters of an hour after the last coat has been applied and the grout between the joints has fully subsided, and the initial set is taking place, the whole surface shall be lightly sprinkled and all surplus mixture left on the top shall be swept into the joints, bringing them up flush and full. After the grouting is done and a sufficient time for hardening has elapsed, so that the coating of sand will not absorb any moisture from the cement mixture, one-half inch of sand shall be spread over the whole surface, and in case the work is subjected to a hot summer's sun an occasional sprinkling to dampen the sand shall be made for two or three days.

After the grouting is completed the streets shall be kept closed and no carting or traffic allowed until at least seven days have elapsed on any portion of the streets grouted, and the face of the pavement shall be kept moist if the condition of the weather requires this precaution, as may be directed by the engineer. Should the bond between the blocks become broken for any reason during the progress of the work the joints shall be cleaned out, even if it is necessary to take up and relaid the blocks, and such parts so taken up and relaid shall be re-grouted and rebarricaded.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Street Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Will Use Oil on Unpaved Streets

Niagara Falls, Ont.—Merchants and residents living in the unpaved streets will not be bothered with dust the coming summer, it being decided by Works Committee of the Council to again use oil, as it has been found to give better results than water, and at a lower cost. City Clerk Seymour was instructed to obtain samples and estimates on the cost of street oil, and to report to the Council.

Mayor Favors Paving Plant

Portland, Ore.—Mayor Simon thinks the establishment of a municipal paving plant as contemplated under the proposed charter amendment to be submitted to the voters at the coming municipal election would result in great good. Not only could such a plant be used by the city in repairing old pavements, but he believes that many new pavements could be laid, and by competing with the private paving companies in this manner keep the cost of paving low.

Narrower Streets Find Much Favor

Los Angeles, Cal.—Narrower roadways on residence streets, as advocated for Los Angeles by W. M. Humphreys, inspector for the Board of Public Works, are finding much favor with citizens. The principal advantages of the plan claimed by Mr. Humphreys are that streets 25 feet wide or less are amply able to care for the usual traffic on residence thoroughfares, cost less to pave and maintain and afford better opportunities for planting trees and otherwise beautifying the parkways. The sidewalks are out to the curb line and the parkways are added to the lot area, without the municipality surrendering any rights. This method adds greatly to the appearance and privacy of residence property by throwing the residence farther from the traffic on the sidewalk. With the old way, six to eight feet of the street was lost in a cobblestone gutter, but with the smooth surface from curb to curb such gutters are not needed.

Will Use Oil on Park Roads

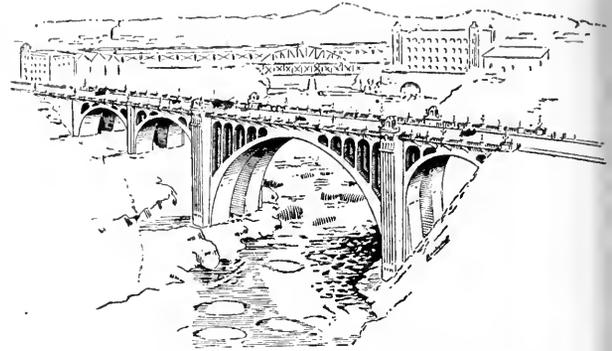

Cincinnati, O.—Water will no longer be used for sprinkling the park roads, as City Engineer Shipley is of the opinion that sprinkling is "medieval" as a method of getting rid of dust. His recommendation was concurred in by Director Sundmaker, and City Solicitor Ballard holds that the Service Director may provide that oil be used to keep down the dust.

Organized Plans for Repair of Roads

Los Angeles, Cal.—A repair force to look after keeping of the new good roads system and preventing damage to it will be immediately organized by the Board of Supervisors in conformity to recommendations by F. H. Joyner, Highway Maintenance Engineer. A motor truck for repairing the highways has been advertised for, and the force will be in charge of Oliver T. Georges, now a chauffeur for the county. Engineer Joyner's recommendations for the upkeep of the highway system are as follows: For the repair and maintenance of roads constructed by the Los Angeles County Highway Commission, it appears best to have two organizations—one to take care of the small repairs, such as patching macadam and shoulders, maintaining small waterways, slopes, etc., and the other to do the larger repairs, such as a general oiling, sanding or resurfacing of the roads and also the rebuilding of certain sections of roads where this method of treatment seems to be necessary. These two organizations had best be started in a small way and as a nucleus around which can be built a force and equipment necessary to properly and economically maintain all the highways the county may construct.

Rapid Progress on Bridge Built by Day Labor

Spokane, Wash.—Work is being rushed on the new Monroe street bridge, which City Engineer Macartney is building by day labor and expects to have completed this summer.

CONCRETE BRIDGE UNDER CONSTRUCTION BY DAY LABOR

The illustration shows the structure as it will look from the west when completed. The falsework for the main span is now being erected. The bridge is estimated to cost about \$500,000.

Improving Towns' Streets

Hartford, Ala.—The Town Council is having all the main streets of town graded and prepared with a hard clay surface which will add materially to the beauty and convenience of the town.

Make Property Owners Pay for Paving

Toledo, O.—By a tie vote Council Committee on Public Improvements last week refused to approve the proposition to have the city pay 25 per cent of the cost of improving University Boulevard in Harvard Terrace. The city accepted the central parkway on the boulevard, a Service Director Cowell was of the opinion that this obligated the city to pay half the cost of the abutting macadam pavement. Assistant City Solicitor Duer expressed the opinion that the whole cost can be assessed to the property owners, the city to pay for the curb line along the parkway.

For Road Improvements

San Antonio, Tex.—For the purpose of raising money for keeping up the county roads and building new ones the County Commissioners are considering the feasibility of placing a slight increase on all property valuations in the county and thus with the same old rate accomplishing the purpose of getting larger revenues. Whatever sum realized over and above the budget allowance can be transferred from the general fund to the road and bridge fund and the roads in the county thus given more attention. With the increase in the use of automobiles the demand for good roads is imperative.

Oil Will Be Used on Streets

Norwich, Conn.—It has been decided that the use of water on the streets will be curtailed this year as it will last and that oil, which proved so effective in keeping down the dust, will again be used on all but the block of brick pavement, which cover but a small section of the city. After the streets have been oiled early in May they will be oiled again in August, which it is thought will carry them through the season and keep the dust down. It is probable it will take 24 tank cars and the cost will be practically as much as by the use of the water, but it has proved more satisfactory and millions of gallons of water are saved.

SEWERAGE AND SANITATION

Town to Have Sewer System

Attalla, Ala.—Wilburn Hill, who has been connected with Hazleton and Anderson, engineers of Atlanta, will have charge of the laying of the sewer system of the city of Attalla. The work will be commenced almost immediately and will be completed within two or three months. The rapid growth of Attalla has made the sewer system necessary in order to preserve the health of the town.

Health Department Urges Reforms

Duluth, Minn.—A recent bulletin issued by the Health Department deals with a wide variety of subjects and urges many reforms and improvements. Among the recommendations made are the following: Push the lodging house ordinance; insist upon sanitary delivery of bread; boost municipal collection of garbage; war against the fly; individual towels in public schools; individual towels and sanitary drinking fountains in public buildings.

Sanitary Drinking Fountains in Schools

Woonsocket, R. I.—Sanitary drinking fountains are to be installed in the public schools of the city, arrangements having been made for the work by the property committee of the school committee. Between 80 and 90 fountains will be installed, with at least one in every building. This improvement in behalf of the health of school children follows the vigorous plea made for fountains as preventives of scarlet fever and diphtheria by Joseph T. Roswell.

Bar Sewage from Channel

Toledo, Ohio.—The city has been asked to take steps toward the protection of the channel of the Maumee River in the vicinity of the new city water works by preventing sewage and other material from going into the river at this point in a letter received by Mayor Whitlock from the United States Engineer's office at Cleveland. It is pointed out that an investigation of conditions was made by the local inspector, following complaints received recently, and that delay in correcting the injury to the channel, already produced, may result in damage to the channel at other points. The matter was referred to Service Director Cowell, who will take action.

Citizens Hastily Build Road to Frustrate Sewer Plans

Plainfield, N. J.—In disregard of the Sunday laws, the Citizens' Committee of Bound Brook, with a gang comprising 46 laborers, assisted by a number of property owners, worked all day opening up the new road through North Plainfield township, whereby they hope to defeat the borough's plans of locating sewage disposal beds on the Zvolnck farm. Henry G. Opdycke, chairman of the committee, himself an engineer, directed the operations, which attracted a large number of spectators from Bound Brook and the surrounding towns. It was an interesting sight to witness the property owners working alongside of the laborers, but they were so anxious to push the improvement that the social inequality cut no figure. During the day bridges were built, drains placed in position and trees were cut down. The new road has several angles to it and it is doubted very much whether the Board of Freeholders will accept the thoroughfare. A prominent citizen of the borough, in speaking of the project, said that anyone can see the purpose for which the road was built; that the original stakes have not been followed and that it is plain to all that it was opened to block the sewer scheme. In view of these facts, it is the opinion of North Plainfielders that neither the State Board of Health nor the courts will sustain Bound Brook. The improvement is being paid for by the property owners, who have also given the right of way for the thoroughfare. Mr. Opdycke says that the townships of Bridgewater, Warren and Piscataway, the Bound Brook Council and Board of Trade are organized under the head of the Citizens' Committee and will go to the limit to defeat the sewer scheme. The State Board of Health will meet to-morrow, when it is expected that a decision favorable to North Plainfield will be given and the borough will then go ahead with its project, condemning the land needed for sewage disposal beds.

WATER SUPPLY

Consulting Chemist Finds City's Water Pure

Bangor, Me.—Prof. J. M. Caird, of Troy, N. Y., who is engaged as consulting chemist by the Water Department of the city of Bangor, has submitted his annual report on the city's water supply. Much of the document is given to tables and results of analyses made from time to time. He speaks in the highest terms of the new filter plant, and closes his report with the statement that Bangor has the best water supply in the State.

Increasing Capacity of Reservoir

Ogden, Utah.—Work has been commenced concreting the old city reservoir and increasing its capacity. The Moran Construction Company has a large force of men engaged in deepening and widening the big receptacle, so that it will conform in sanitary perfection with the new reservoir No. 2. The capacity of the reservoir will be increased nearly 2,000,000 gallons. Its present capacity is a little over 5,000,000 gallons, but by deepening it about four feet and widening it by extending the sides 30 feet outward a capacity will be gained of 7,000,000 gallons.

Town Drills Wells for Pure Water

Moorhead, N. D.—The new well which the city has just finished is only the beginning of a plan that has been adopted by the Moorhead City Council for giving the people of the city the best water available in their mains. The engineers who have gone over the ground declare that at the depth of the present well lies an underground lake which is large in its extent and will furnish the city consumers with the best and purest water that could be wished for. The present well is 12 inches in diameter inside its casing and is the first of a series of test wells which, if it proves a success, will be drilled. It is the plan of the city to fill the city water mains with this water, thus cutting out the supply from the river. The plan also includes a large reservoir up the river, which will be turned into the city mains in case of extreme necessity.

Gorge Dammed for Pure Water

Lawton, Okla.—In a narrow gorge of the Wichita Mountains, 14 miles distant, the city of Lawton is building of granite and cement a dam which will impound a supply of water for municipal purposes unexcelled for purity and clearness. This water will come from the watershed of the Wichita National Forest reserve into Medicine Creek, a mountain stream, and thence to the reservoir basin, without the slightest chance of pollution. The drainage area embraces 150 square miles, in which there is not a town nor a homestead. For all time there will be a water supply far in excess of the needs of a city four or five times the size of Lawton. The reservoir is 12 miles from town by pipe line, and the base of the dam 115 feet above the highest point in Lawton, where the average pressure will be about 90 pounds to the square inch. The plant is one of magnitude, but its construction is attended with few serious engineering problems. The location for the dam was chosen at a point where Medicine Creek barely squeezes its way through a cleft in the Wichitas. United States Army engineers at Fort Sill were asked to apply their knowledge to the situation. They drilled to a depth of 30 feet in the foundation, made estimates of the amount of water that would flow from the watershed and of the amount that could be impounded by the proposed dam, after which they approved the undertaking. For basin purposes 2,200 acres of land were purchased, the land touching the forest reserve. The present capacity of the reservoir will be 16,000 feet, equivalent to a foot of water on 16,000 acres, or a total of 5,500,000,000 gallons. The actual water area will be about 1,200 acres, with an average depth of 14 feet. The runoff of the watershed is estimated at 1,632,000 acre feet a year, a supply sufficient for a town with a population of 100,000, after deducting all wastage. Without a drop of rainfall a full reservoir would serve a town of 20,000 inhabitants for three and a half years, allowing 100 gallons per capita every 24 hours. The cost of construction is covered by a city bond issue. The contractors have been at work about seven months, and it is expected the work will be finished in July.

Town Improves Water System

Phoenix, Ariz.—Superintendent Avery Thompson of the city water department, assisted by Engineer Frank J. Ambull of Los Angeles, submitted the new pump installed at the city plant to a series of tests, found it satisfactory and recommended its acceptance.

Canadians Inspect Our Water Works

Toledo, Ohio.—Superintendent Wisler of the municipal water works has received word that a commission from Toronto, Canada, would visit Toledo to secure information regarding water intakes.

Sandbar in River Endangers City's Water Supply

La Crosse, Wis.—Unless one of the vagaries of the upper Mississippi's current sweeps away the sandbar that has formed over the mouth of a 24-inch intake pipe that supplies this city with water it will be necessary to move the pipe in about 30 feet. Expert divers have examined the river bed and report that the city may soon be without a water supply.

Advocate Free Water for Factories

Fort Worth, Tex.—Free water for Fort Worth factories for a term of 10 years—that is the text of a recommendation sent to the City Commission by Mayor Davis, who suggests that the city adopt the slogan of the Board of Trade, "We're for Smoke," and assist in making Fort Worth the greatest manufacturing center in the Southwest. According to the plan outlined the free water is to begin when the big \$1,350,000 reservoir is in operation. This will probably be in the fall of 1912, when Fort Worth will be able to boast of the largest supply of water of any city in the South.

Water Supply the Problem

Elizabeth, N. J.—The finding of a water supply is the puzzle that now confronts the Elizabeth committee on a municipal water plant. Men who are the most anxious that such a plant be secured, and who declare that Elizabeth and every other city should own its own water plant, shake their heads in doubt when asked where a water supply is to be obtained. It is pointed out that the Elizabeth-town Water Company, already long in the water business, is having difficulty in getting enough water, although it has several good sources at its command. This company intends to tap the springs and water sources away up in Ridgewood, so that this municipality will not suffer a water famine.

City Commission Personally Investigates Water Situation

Moline, Ill.—A peep into the "water problem" was taken last week by the City Commission, which visited the water works plant in a body and spent an hour viewing the filter beds, inspecting the boilers and hearing explanations from Engineer Magnus Olson. During the informal discussion that was carried on during the inspection tour water meters were suggested as a solution of the problem before the new Council. The Commissioners—or some of them at least—admitted water meters have their good points, but it was pointed out that installation of the meters would result in great opposition.

Helena Will Hold Water Bond Sale

Helena, Mont.—Three courts having rendered decisions affecting the right of the city of Helena to sell \$600,000 of water bonds, the city will proceed with the sale. The most important decision was that rendered by United States Judge Gilbert, at Portland, in the application of Receiver C. E. Bockus of the Helena Water Works Company, for an injunction to prevent the city from selling the bonds and installing a municipal water plant. This case was heard in Portland by reason of the fact that Federal Judge Carl Rasch, of this district, was formerly attorney for the water company and was disqualified. The city officials declare that the victories won mean the end of the long legal fight which has been waged between the city and the water company for the past 15 years. The receiver for the Helena Waterworks Company has announced that he would offer the plant to the city for \$400,000, to be paid for by 20-year 5 per cent. bonds. This price is \$190,000 less than an offer made by the company a month ago.

STREET LIGHTING AND POWER

City's Lights Famed

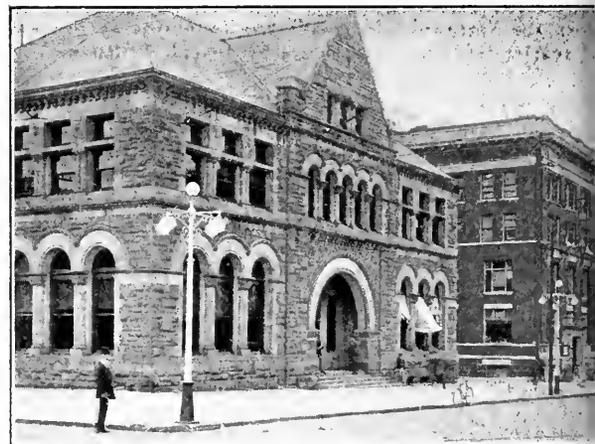

Baltimore, Md.—Boston City Councilmen will visit this city within the next ten days to inspect the lighting system. They will also study the local method of disposing of garbage. Boston is about to renew a contract involving the expenditure of several millions for lighting the streets. Walter Collins, President of the Council, is quoted as saying that aside from Milwaukee, Baltimore is the best lighted city in the world.

New Lighting System

Washington, D. C.—Work of installing the new lighting system in Vermont avenue, Connecticut avenue, Massachusetts avenue, Lafayette Square and Seventeenth street was commenced last week. Some street repairs have been planned, which will necessitate the tearing up of part of the pavement in front of the White House, and the lighting company planned to take advantage of that to begin the work of installing its cables.

Committee Reports on Lighting System

Lansing, Mich.—The committee of the Saginaw Board of Trade, which recently visited Lansing, has reported to the board that Lansing has 320 electroliers or poles bearing one, three and five light clusters of tungsten burners. The cost last year of a total of 803 separate lights and clusters

Courtesy Saginaw Daily News.

5-LIGHT STANDARD USED AT LANSING, MICH.

or a total of 1,503 lights, was \$22,000. The current is furnished by a municipal plant which now has \$40,000 in the bank to its credit. As a rule five-light clusters are placed at the corners of streets and three-light clusters in the intervening space. The standards are made by the Michigan Brass and Iron Works, a local manufacturer.

Novel Concrete Lamp Posts Placed in Park

Pasadena, Cal.—The city lighting department has just completed installing fourteen concrete lamp posts in Library Park. These lamp posts are unique in that the base being separate is set first and the tapering columns are afterward cemented into same. Building them in two pieces greatly reduces the first cost as well as effecting a great saving in transportation. All the wire connections are underground, and work of erection as well as design of holders for the ground-glass globes was done by the municipal lighting plant.

New Electrical Plant Rises in Record Time

Cleveland, O.—The Cleveland Electric Illuminating Company expects to have the first unit in its new plant at the foot of East Seventy-first street in operation between July 15 and 20. The entire plant of six units will be completed before September 1. Each unit will supply 14,000 kilowatts. The plant, which will be one of the largest and finest of its kind in the country, is being built more rapidly than any similar institution ever erected. Structural work was started last December and brick work on February 22. The plant will cost in the neighborhood of \$2,500,000. "It has been designed to take care of Cleveland and Cleveland's growth," General Superintendent Robert Lindsay states.

FIRE AND POLICE

Auto Fire Truck Tried

Milwaukee, Wis.—A modern auto fire truck which was put out one day last week is to be given 30 days' trial in Milwaukee, and if it proves satisfactory to the department will be recommended to the Common Council for purchase. The powerful red machine, a combination chemical truck and hose cart, carries 1,000 feet of hose, 250 feet of chemical hose, a chemical tank holding 30 gallons and 7 men.

Auto Engine Kills Two

Passaic, N. J.—One of the Passaic Fire Department's automobile fire apparatus skidded and crashed into an iron trolley line pole one night last week, wrecking the machine and killing two men. The dead are Charles F. Cowley, secretary to the Passaic Board of Education, and Lieutenant James A. Delaney, of the Fire Department.

Auto Chemical Engine Found Economical

Middletown, Conn.—In a recent report of the Fire Chief to his department the statement was made that from April 15, 1910, to April 15, 1911, the actual expense of Middletown's combination auto-chemical was exactly \$39.61. A year before the auto was purchased the expense of maintaining a pair of horses on Hose 1's wagon was \$350.02, leaving the snug balance of \$310.41 in favor of the auto.

New Signal System

Buffalo, N. Y.—The new police signal system has been put into operation at the Pearl street station, and was operated throughout the precinct, being watched by Inspector Martin and Captain Gilligan, who pronounced it successful. It consists of a number of call boxes on each man's post attached to telegraph poles. Above the box is a red light used to call men to the box. A bell will ring the daytime to notify men they are wanted at the box.

Motor Fire Apparatus Installed

Lansing, Mich.—The new motor fire engine apparatus has been installed in Central Fire Station, where it is ready for future emergencies.

More Police Equipment

Alexandria, Ind.—In addition to the Luger automatic pistols which the city recently purchased to arm the police are another supply of police paraphernalia, in the way of truncheons and handcuffs, has been received. This makes the equipment of the department first class in every respect, and as the officers have recently donned their new summer light uniforms the force is in excellent condition.

Fire Truck for Racine

Racine, Wis.—Racine's first automobile fire truck arrived last week from New York in charge of an expert, who will teach the fire fighters how to run the \$5,000 machine.

Fire Loss Is Small

Richmond, Ind.—Because of the efficiency of the Richmond Fire Department the Board of Works will make an effort to have lowered the insurance rates as assessed by companies doing business here. The city's fire loss in the last three years has been far below that of other cities in the State where the fire insurance rates are the same in comparison with those effective here, and the city officials believe that property owners are entitled to a lower premium because of these facts. The total fire loss in 1910 was less than \$4,000, in 1909 less than \$7,000 and in 1908 about \$50,000. The city regularly employs 30 firemen and has a reserve of equally as many more.

Expect Auto Fire Apparatus Will Lower Insurance Rates

Great Falls, Mont.—A demonstration of the auto chemical hose wagon was given last week before J. H. Branscomb, district secretary of the Board of Fire Underwriters of the Pacific. The apparatus was bought in accordance with the recommendation made by him in 1909, which recommendation was also embodied in the report made by engineers of the National Board of Fire Underwriters last year. A re-inspection of property coming under the protection of the Great Falls department is now being made for the purpose of ascertaining if a lower rate of fire insurance can be established here.

GOVERNMENT AND FINANCE

Mayor Elected by Close Margin

Norfolk, Neb.—At the biennial city election held on April 4 Mayor John Friday was re-elected by a majority of one vote out of a total of 1,151 votes cast.

Plans for National Municipal Accounting Bureau

New York, N. Y.—The Bureau of Municipal Research announces that it has engaged U. L. Leonhauser as accountant for the national fund established by ex-Comptroller Metz for "promoting efficient municipal accounting and reporting." Mr. Leonhauser will have charge of the co-operative investigations conducted with the City Comptrollers and Mayors of other cities by that fund, and of the correspondence which Mr. Metz hopes will "make available to American cities the best principles and practice worked out in municipal accounting and reporting." With him will be associated George L. Bergen.

Women Not Allowed to Vote May Invalidate Election

Traverse City, Mich.—According to a ruling made by Assistant City Attorney Higbee, of Grand Rapids, the recent city election in Traverse City may be entirely invalidated and all because the female voters there were accidentally disfranchised. It developed that in Traverse City the school office candidates were placed upon the regular city ballot and no separate ballot for the women was supplied. Naturally the women could not vote for any but the school officers, and so were not allowed to vote at all. In Grand Rapids the charter distinctly provides that separate ballots must be prepared for the women who wish to vote at school elections or upon bonding propositions, but the provision merely carries out the broader provisions of the State law. The authorities of Traverse City decided they would not prepare special ballots for the women because there was no specific charter provision requiring it. Therefore Traverse City women were denied a vote, while in Grand Rapids, Detroit and elsewhere women were allowed to vote for school trustees.

Commission Government Elections

Winston-Salem, N. C.—Commission form of government for the city of Winston was defeated by a majority of 106.

Montgomery, Ala.—Two of Alabama's chief cities have dropped the Aldermanic form of municipal administration for a system of commission government. In Birmingham three City Commissioners were sworn. Mayor Culpepper Exum is one of the Commission. Montgomery has five Commissioners appointed by the Governor. Mayor W. A. Gunter, Jr., is one of them.

Taylor, Tex.—The election on the special city charter enacted by the recent Legislature providing for a commission form of government for Taylor resulted in its rejection by a vote of 290 to 357, a majority of 67 votes against the measure. A total of 647 votes were polled.

Marshalltown, Iowa.—This city has passed from under the old municipal form of government with a Mayor and seven Councilmen to the commission form. Mayor Jones and Councilman Herman were installed, the seat of Councilman Derby being contested.

Faribault, Minn.—The commission form of government was chosen here by an overwhelming majority at a recent election.

Parkersburg, W. Va.—At a special election called for the purpose the voters of Parkersburg adopted a new charter providing for the commission form of government, the initiative, referendum and recall. The vote was 1,831 for the new charter and 1,622 against it.

Paola, Kan.—Commission form of government lost in Paola at a recent election by 24 votes.

Raleigh, N. C.—Raleigh voters defeated the commission form of government by a vote of 886 to 437, only one ward, the second, having given the majority for the measure provided by the recent Legislature and subject to adoption by the people of Raleigh.

STREET CLEANING AND REFUSE DISPOSAL

Garbage Reduction Plant Ready for Use

Bridgeport, Conn.—The work of rebuilding the garbage plant has been practically completed, and the owner, Charles Fischer, expects to begin receiving garbage for reduction next week. Four digesters have been installed so that the capacity of the plant will be 60 tons of garbage during every eight hours. The Mayor and members of the Board of Health will thoroughly inspect the plant before it is opened. Practically the entire equipment of old apparatus has been discarded.

Engineer to Inspect Electrolytic Disposal

Atlanta, Ga.—For the purpose of sending an engineer to examine and inspect the electrolytic sewage disposal plant recently installed at Oklahoma City, Okla., City Council last week adopted a resolution appropriating \$100. W. A. Hansel, the engineer in the Chief of Construction's office, who has charge of the bond issue work, will be the man to go at the city's expense. He is a competent engineer and a thoroughly reliable expert, and whatever he brings back the City Council will be willing to accept as authoritative.

Tests Being Made with Uniform Pressure Street Flusher

Peoria, Ill.—Projecting a long blade-like stream of water from a front nozzle on either side, a new device known as the Studebaker uniform pressure street flusher, is being given a series of tests on the downtown streets under the direction of the Commissioner of Public Works. The thin blade of water sweeps over the surface like a broom, throwing the dirt toward the curb and leaving the pavement as clean as if it had been scrubbed by hand. The flusher, when loaded, weighs 11,460 pounds, and the cost of the machine is \$1,000. Thus far the tests made have been eminently satisfactory.

Cost of Operating Crematory Greatly Reduced

Tampa, Fla.—The report for the second month's operation of the garbage crematory has been issued. The first month's operation gave a cost of \$0.405 per ton, the second \$0.231. The material consumed totaled 1,267.2 tons, or 3,168 loads, an average of 47 tons a day.

Street Sprinkling in Utica

Utica, N. Y.—In some cities contracts are let for sprinkling the streets to lay the dust during that portion of the year when such service is desirable, and in former years the business men of Utica had an arrangement by which the principal business streets were sprinkled. Of late, however, the only street sprinkling done in this city is that which the Utica Sweeping and Contracting Company does in connection with the regular work of sweeping. The city has an agreement with the company that whenever sprinkling is needed to keep the dust down prior to sweeping the streets the company is to do it. The company has had its sprinklers in use for some time.

Midnight Refuse Removal

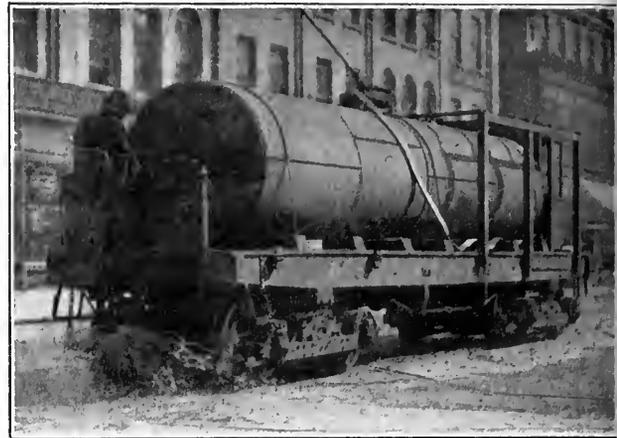

New York, N. Y.—Street Cleaning Commissioner Edwards has announced that he is going to try the experiment of removing ashes and garbage in the night. The test will be made in Manhattan, Brooklyn and the Bronx. Mr. Edwards says it is the intention of the department to give this method a careful tryout, and the instructions are, if possible, to make it a success. It is believed that this method will lead to the use of vehicles which will better accommodate the collection than those at present in use—that is, trucks of larger capacity, manned by three men instead of one and drawn by three horses.

Oil and Water Sprinkler Purchased by Citizens

Texarkana, Ark.—The combination oil and water sprinkler recently purchased by public spirited men of the East Side has arrived, been put together and is in readiness. The tank has a capacity of 600 gallons, and when filled the apparatus will weigh something more than four tons. The machine is strongly built, and is equipped with wheels having tires $4\frac{1}{4}$ inches wide, which are expected to be a benefit to the streets.

Home-Made Trolley Sprinkler

Milwaukee, Wis.—Pending the arrival of eight new trolley street sprinklers the Milwaukee Electric Railway and Light Company rigged up a home-made affair. The ma

Courtesy Milwaukee Sentinel.

HOME-MADE STREET CAR SPRINKLER

chine made good beyond expectations. The apparatus consisted merely of a horizontal cylindrical tank mounted on a platform car with proper pipe connections and an ordinary sprinkling valve at the rear.

New Plan for Garbage Disposal

Cleveland, O.—A revolution in the system of handling garbage at the municipal reduction plant may result, if experiments now being conducted work out as expected. The system of cooking the portion of the garbage left after the grease has been extracted and selling it as fertilizer will be abolished should the scheme prove successful. Instead of expending power in the manufacture of the fertilizer, the portion of the garbage will be sold as horse feed after a certain mixing process is followed. The material will be used in the city's own stables and will be sold to other horse owners as well. "The city has 350 horses," said Director Lea recently. "The feed bill is something like \$100 a day. It is the cooking of the garbage after the grease has been extracted that causes the smell. If a new system is adopted there will be no odor at the plant. In addition the power cost will be reduced. The cost of power at the present time is \$2,000 a month."

New System of Street Cleaning Will Be Tried

Rochester, N. Y.—Announcement has been made by Commissioner of Public Works F. T. Elwood that the flushing of the thoroughfares in the central part of the city and the streets near the entrances to the parks will be commenced by the city employees the latter part of next week. It is expected that the winter's accumulation of dirt and debris will have been disposed of by the contractor on the sweeping and cleaning of the streets by the middle of the week. Owing to the long winter an unusually large amount of dirt and debris had accumulated on the streets. After the general cleaning now in progress the contractor will be held responsible for the condition of the thoroughfares and will begin to do the cleaning and sweeping under the new system inaugurated by Commissioner Elwood. There will be 123 men and carts employed on the work, a certain amount of street space being assigned to each cleaner, who will be held responsible for its condition by the contractor. The cleaners on the downtown streets where the traffic is heaviest, will necessarily have less ground to cover than those detailed to work on the outlying streets. Instead of leaving piles of dirt on the streets as has heretofore been the custom, the cleaners will be required to dispose of their refuse in their little black cart. In the past the dirt piles were allowed to stand until night when the refuse was removed in wagons. Pending the arrival of the wagons the refuse was frequently blown a distance over the streets by the wind.

RAPID TRANSIT

Street Cars for Emporia

Emporia, Kan.—Emporia is going to have street cars, the franchise carrying by a majority of more than 500 in the city election. The franchise also carries with it the leasing of the municipal light plant to a Dayton syndicate. There was a strong fight against leasing the plant, but municipal ownership has proven a failure and the citizens voted for the franchise, hoping that the street cars will prove a benefit to the city. The provisions of the contract call for the payment of 5 per cent interest on the valuation of the plant by the Dayton syndicate. The plant has been valued at \$68,000. The franchise gives the syndicate the privilege of operating a car line and the plant for 10 years and fixes the rates to be charged for electricity.

Street Railway Company Gets Two Franchises

Salt Lake City, Utah.—The city has granted a franchise allowing the Utah Light and Railway Company to extend its line on Eleventh East from Twelfth South in a southeasterly direction to the city limits. The county has granted a franchise for a continuation of this line on to Holiday and an extension of the West Temple line from Tenth to Twelfth South streets. It is the intention of the company to complete both extensions during the present year.

Trolley Franchise Granted

Chester, Pa.—The ordinance adopted by the Lansdowne Borough Council several weeks ago, giving the Terminal Street Railway Company the right to build a trolley line through the borough to connect with the Lansdowne and Darby "short line," has been approved by Burgess Carscaddon. The franchise calls for swift and businesslike action in construction. If the corporation accepts it and lives up to the terms laid down Lansdowne will have direct access to the city by way of the Market street "L" within nine months. If the company does not begin construction within three months the franchise will lapse.

MISCELLANEOUS

Cities to Build Conduits

Columbus, O.—A bill by Representative Reynolds of Columbus, introduced in the House, proposes to give cities power to build conduits and compel the burying of corporation wires. Representative Donson introduced a measure to make more rigid requirements for the erection of fire escapes on mercantile buildings. The bill is taken from the general code prepared by the State Board of Health, State Fire Marshal and State Factory Inspector.

Segregation Ordinance Adopted

Newport News, Va.—The Board of Aldermen last week adopted the so-called "dead line" ordinance fixing a line in East End for the separation of the white and negro residential sections. The measure provides that hereafter no white person may move into the section bounded by the "dead line" and no negroes may hereafter move into the white section.

Citizen Donates Playground

San Antonio, Tex.—A public playground one mile long, 200 feet wide for its entire length, bordered on each side with four rows of shade trees, containing many beautiful flower beds, a long swimming pool in the center, with two bath houses, will be deeded in perpetuity to the people of San Antonio by F. F. Collins. This announcement was made by Mr. Collins, a director in the Civic Improvement League. Collins Gardens, where the playground is being laid out, is a famous show place with its wonderful artesian wells and highly productive 10 and 20-acre truck farms. The beauty of the landscape will be continued and added to in the playground at an expense of \$50,000 by Mr. Collins. He has been quietly proceeding with his plan for some time, having had landscape gardeners at work, walks laid out, plans for miniature lakes and swimming pool all completed.

City Considers Underwriting Own Insurance

Scranton, Pa.—A resolution has been adopted by the Common Council providing that a committee of six, three from each branch of Council, be appointed to consider legislation for the creation of a sinking fund to be substituted for the present system of fire insurance for city buildings. The city averages in three years in the neighborhood of \$5,000 in fire insurance premiums. The payments generally are \$1,000 a year for two years and \$2,000 for the third year.

Stock Park Lakes with Fish

Fort Worth, Tex.—Superintendent Vennedge has made a requisition on the United States fish hatchery at San Marcos for fish to stock the ponds at Marine and Trinity parks. The lake at the former park has an 8,000,000-gallon capacity and it is well filled with water. The Trinity Pond is of 1,500,000 gallons capacity. The allotment of fish will be in proportion to the capacity of the ponds or lakes.

Planting a Thousand Trees Along Streets

Syracuse, N. Y.—More than 1,000 shade trees will be planted along the city streets this spring under the direction of the Bureau of Parks. Hundreds of applications for trees have been made by property owners, and where possible they will be complied with. The chief varieties are American elm and soft maple, which are regarded the most hardy and practical for street purposes. More ornamental kinds are used for parks and lawns. Poplars are not permitted because of the lint they shed, and the fact that their long roots penetrate sewer pipe connections, causing obstruction and damages. Lindens and basswoods are used to some extent. The Bureau of Parks is keeping a close watch for pests which attack park and shade trees. The tussock moth is regarded as the worst to deal with, but it will be some weeks before the larvae appear. Many of the cocoons are now on the tree trunks in different parts of the city, and it is planned to destroy as many as possible before they develop.

City to Have Department of Automobiles.

Spokane, Wash.—A new city department will be created to be known as the "Department of Automobiles" and probably placed under Commissioner D. C. Coats. To solve the problem of maintaining and caring for the machines of the various departments the City Commissioners have requested Commissioner Fairley and the Corporation Counsel to prepare an ordinance for passage creating the department mentioned. While the city has its own garage and mechanic in charge, there is no way of taking care of the salaries of chauffeurs, bills for supplies, etc., except for each department to take care of these expenses out of the department funds.

Pass Ordinance as to Theaters

Janesville, Wis.—Janesville's new theater ordinance, drawn up by the City Attorney, was given its third reading last night and placed on passage by a unanimous vote of all the Aldermen. The principal features of the ordinance are against the crowding of theaters and allowing people to stand in the aisles and entrances; it requires each place to have a fireproof room provided for the motion picture machinery, sheathed with galvanized iron and asbestos lined.

Systematic Plan to Beautify City Will Be Carried Out

Houston, Tex.—A new policy involving a systematic plan for beautifying Houston has been announced by the Chamber of Commerce co-operating with the city through Mayor Rice. It involves the appropriation and expenditure of sufficient funds to obtain results desired. The work is to be done with absolute system, having in view a definite purpose. F. H. Pottinger has been employed to take charge of the work and will rank as the Chief Forester of Houston. He will have an office in the rooms of the Chamber of Commerce, and his services will be available to the public. A committee from the Chamber of Commerce called on Mayor Rice in regard to the proposed plans of beautification, especially the work dealing with the ship channel. At the conclusion of the conference he pledged the city to appropriate half of whatever fund may be necessary in the work of bayou beautification. It is estimated by Secretary Boldt of the Chamber of Commerce that \$10,000 will be adequate for the bayou work.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Sidewalk Obstructions—Injuries—Instructions

City of Harrodsburg vs. Sallee.—In an action for injuries to a pedestrian who stumbled over an obstruction on a sidewalk the court charged that if the obstruction had been there an unreasonable length of time, and the municipal authorities knew or might have known by reasonable diligence of the existence of the obstruction, and it was of a form and character ordinarily calculated to cause persons walking and exercising reasonable watchfulness for their own safety to stumble and fall, and plaintiff was reasonably watchful for her own safety, the verdict should be for plaintiff, otherwise for defendant. Held, that the instruction was not erroneous as failing to present defendant's theory of contributory negligence.—Court of Appeals of Kentucky, 130 S. W. R., 405.

Removal of Policeman—Compensation

Kammerer vs. City of Louisville.—Where a policeman is dismissed, without charges being preferred, and without notice and a trial, the city is liable for his salary until the entire number of policemen authorized has been appointed, without a determination of the rightfulness of his dismissal; but when the full complement is appointed, the right of such policeman to recover his salary ceases until he establishes his title to the office in a direct action.—Court of Appeals of Kentucky, 135 S. W. R., 411.

Franchises—Indeterminate Permit

City of La Crosse vs. La Crosse Gas and Electric Company.—The feature of the public utility law rendering non-enforceable existing contracts relating to any charge of service regulated thereby in case of conversion of an old into a new franchise by a surrender of the former, by necessary implication, renders non-enforceable obligations of the corporation incurred as a condition of the old franchise and substitutes therefor the obligations and conditions of such law.—Supreme Court of Wisconsin, 130 N. W. R., 530.

Bonds—Municipal Purposes

Brown vs. City of Lakeland et al.—The power given the Legislature to prescribe the "powers" of municipalities and to authorize cities and towns to assess and impose taxes for "municipal purposes" does not permit the giving to municipalities as such authority to issue bonds and to levy a municipal tax to pay the bonds, when the proceeds are to be used "for the purpose of erecting schoolhouses and maintaining a system of public education in the municipality."—Supreme Court of Florida, 54 S. R., 716.

Ordinances—Prosecution—Appeal

McKinstry vs. City of Tuscaloosa.—While one accused of a violation of a municipal ordinance is entitled in the municipal court to be apprised by written complaint of the nature and character of the proceeding instituted against him, he by proceeding to trial without demanding in such court such a complaint waives the right thereto; and cannot for the first time avail of it on appeal.—Supreme Court of Alabama, 54 S. R., 629.

Validity of Tax—Presumptions

Hanley vs. City of Elkins.—In order to entitle a plaintiff to recover from a municipality a tax alleged to have been levied by it without authority of law and paid under compulsion, he must prove that the tax was illegal and void. If it appears from the charter of such municipality that it had the right in any event to levy the tax which is sought to be recovered, it will be presumed, in the absence of proof, that the tax was lawful.—Supreme Court of Appeals of West Virginia, 70 S. E. R., 698.

Sewer Ordinance—Compliance with Statute.

Platt vs. City of Payette.—Revised Codes, providing for what shall be contained in an ordinance giving notice of intention to construct a sewer system, must be liberally construed, and a substantial compliance with the provisions of the statute is all that is required of the council, in view of the fact that its passage constitutes merely a preliminary

step leading up to the final issue of the bonds, in case the voters should decide at the special election in favor of such improvement being undertaken.—Supreme Court of Idaho, 114 P. R., 25.

Sidewalk Obstructions—Snow and Ice.

Schneider vs. City of New York.—A municipality is liable to persons who, without negligence on their part, are injured through its failure to remove obstructions from a sidewalk, including snow and ice, but need not do what is practically impossible to avoid accidents. The city of New York was not negligent in failing to remove snow and ice from the sidewalk on which a pedestrian was injured, where scarcely twenty-four hours had elapsed since the obstruction accumulated; the city being entitled to wait a reasonable time for freezing weather to moderate.—New York Supreme Court, 128 N. Y. S., 45.

Defective Sidewalk—Liability.

McCoy vs. City of Utica.—That a pedestrian is injured by some slight defect in a street from which danger was not reasonably to be foreseen, e. g., a depression in a sidewalk to the depth of the thickness of surrounding flagging, right-triangular in shape with base and sides about two feet long, caused by the removal of a broken piece, does not show negligence of the city.—New York Supreme Court, 128 N. Y. S., 60.

Water Bond Election—Illegality.

Blaine et al. vs. City of Seattle et al.—Constitution, Section 6, prohibited cities from becoming indebted to an amount exceeding 1½ per cent. of the taxable property without the assent of three-fifths of the voters therein voting at an election to be held for that purpose. The Seattle city charter provided for bonds for corporate purposes and authorized submission of an intended debt to voters as prescribed by ordinance and another section provided that every ordinance should contain but one subject. The city desiring to issue bonds for eight distinct improvements in no manner related to each other, the aggregate of which, if adopted, would make the city's indebtedness exceed the constitutional limitation, passed an ordinance submitting the proposition so as to require the taxpayers to vote for or against all of them. Held, the ordinance must prescribe a scheme not inconsistent with the Constitution and laws, and that the submission in question did not permit free action on the part of the voters and that the election was therefore void.—Supreme Court of Washington, 114 P. R., 164.

Water Supply—Submission to Vote.

Carlson vs. City of Helena.—An ordinance, submitting for the determination of the voters the question of the propriety of producing a water supply from a certain creek, was not misleading as to the question to be determined, because the city had already purchased and paid for water rights from such creek, since the water supply had not been procured by the city in the sense that it had been made available for use; the propriety of doing so being the real question submitted.—Supreme Court of Montana, 114 P. R., 110.

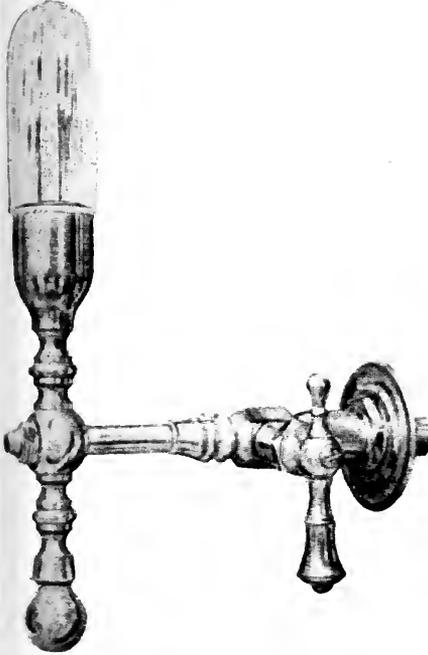

Discharge of Sewage into Water Course

Fonda vs. Village of Sharon Springs.—The discharge by a village of sewage into a natural water course, rendering the waters thereof unfit for cattle to drink, and causing quantities of filth to stand in pools at times of low water, from which a noxious stench arises, is a public nuisance, the right to maintain which could not be given by grant or acquired by prescription. Statutes expressly authorizing the construction of sewer systems with the approval of the State Board of Health give no authority for maintenance of a nuisance involving consequent injuries to private property. The owner of land injured from the discharge of sewage into a stream by a village may have such village restrained, though others contribute to the injury, and may recover from the village such damages as its acts have occasioned up to the time of trial, but such village should be given a reasonable time before enforcing the injunction in which to provide for a different disposal of its sewage, the village in the meantime to pay the injured land owner his damages suffered during such period of suspension.—Supreme Court of New York, 128 N. Y. S., 147.

MUNICIPAL APPLIANCES

Sanitary Drinking Faucets

THE M. H. Foundry and Manufacturing Company, Inc., Belleville, Ill., manufactures a line of sanitary drinking faucets called the Twentieth Century. Of these the Gem is shown in the accompanying illustration. This faucet

GEM SANITARY FAUCET

may be inverted and used in the old way for filling pails or for other purposes. The faucet is furnished of the compression or self-closing type.

Gasoline Trench Excavator of the Wheel Type

THE American Ditching Machine Company, Minneapolis, Minn., manufactures an excavator of the wheel type shown in the illustration. The machine is propelled and the excavator operated by a 40-horsepower gasoline engine. The makers state that under ordinary conditions it will dig a ditch 6 feet

deep and 2 feet wide at a minimum rate of 180 feet per hour, handling 80 cubic yards of excavation. One man operates the machine. The digging and elevating portion of the excavating wheel consists of an inner and an outer 22-inch rim separated by a 6-inch I-beam in the center. The outer rim is cut into segments and equipped with digging knives, forming continuous earth passages on both sides of the I-beam center. At the top of the wheel the dirt is pushed onto rotating discs by plows and discharged from the discs by means of other plows.

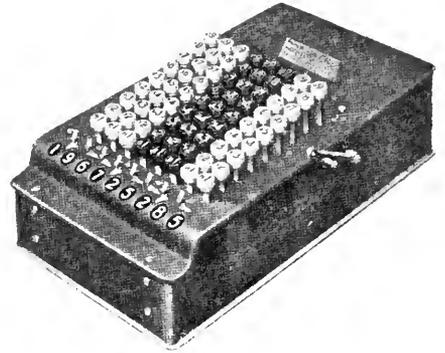

Comptometer Suitable for Engineering Calculations

THE Comptometer, made by the Felt & Tarrant Manufacturing Company Chicago, Ill., is a calculating machine, suitable for the use of engineering and contracting firms, as it does division, multiplication and subtraction with equal facility. The operation is exceedingly simple and can be learned, it is said, in a few hours. Experience, however, greatly increases proficiency.

The Comptometer is light, strong, yet so compact that it can be placed on an open book, desk or drafting table—anywhere convenient to the work. It is operated solely by keys like a typewriter. The operator simply touches the keys and reads the answer. There are no buttons to push, no operating lever to pull. The "touch" system of operation is just as practical as with a typewriter, thus enabling the operator to concentrate his attention on the work before him and so minimizing the danger of misreading figures. The duplex feature of the Comptometer, which permits the keys to be struck in any order or all together in any column at the same time, gives a speed in multiplication and division said to be three to four times as fast as that of a non-duplex machine. One machine will handle the figure work of several men in any drafting room.

The Comptometer may be used in making up a payroll as follows: Each day the timekeepers turn in the occupation of every man on the job and the number of hours he has worked.

The accounting department posts from the timekeepers' books to loose leaf sheets. The extensions and postings of these, it is claimed, are made on the Comptometer in one-half the time re-

COMPTOMETER

quired to do the work mentally. The usual great rush in the accounting department just prior to pay day is thus eliminated. The distribution of the labor charges, as well as charges for materials, supplies, administration and other expenses, is said to be greatly facilitated by the use of the machine.

Fire Alarm Box

THE Lannert Company 3915 Bonna avenue northeast, Cleveland, O., manufacture a fire alarm box which they state can be used in connection with any other make of boxes in the same circuit. The outer box A consists of a large heavy iron box which is furnished with a door B supplied with a good brass spring lock and key and so constructed that after unlocking the outer door this key cannot be taken out of the lock except with a release key, which is inserted in the keyhole C.

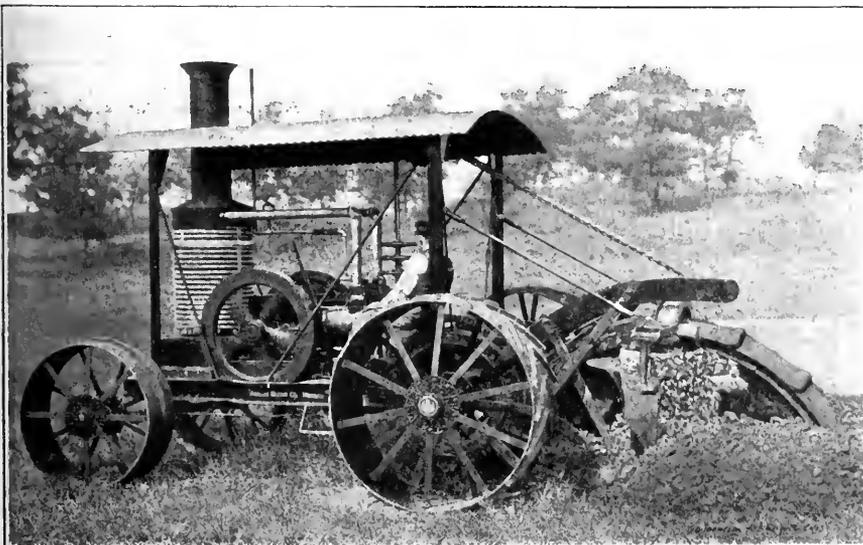

The release key remains in the charge of the fire department, while the unlocking keys are either furnished to people living near the box or a key is placed in a small iron box provided with a glass door so that if the key is desired the glass front is broken and the key, which is attached to the box by a chain, is taken out to unlock the door.

Within the large case and insulated therefrom the smaller square case D is secured, which is also provided with a door E and a brass lock F and is opened by means of the same release key.

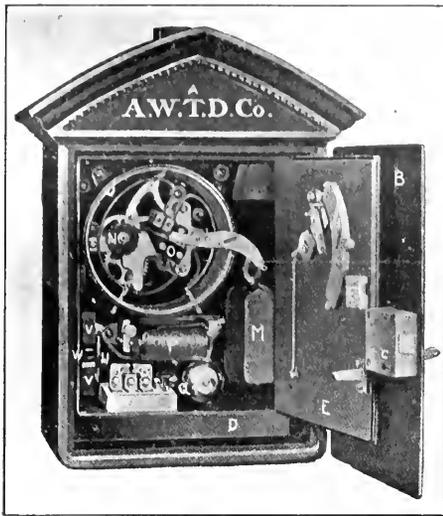

To the inside of the inner door E a lever is pivoted at G, which extends sideways across the inside of the door under the dog H and plate I and projects through the slotted arc of a circle to permit the lever to be pulled down from the outside of the inner door so as to permit of sending in an alarm.

The lever engages the dog H after it is pulled down so as to prevent it being pulled down a second time and thus interfering with the alarm being sent until after the box has completed sending in the alarm, which then disengages itself so as to be in position to turn in another alarm.

Inside of the square case is secured the round case J, having a glass front which encloses a train of gears driven by the segment of gear K, whose shaft extends through the glass front and is secured at its outer end to the lever L, to one end of which is connected the weight M, which moves the clockwork, and the other end of the lever engages with the lever on the door so as to raise

AMERICAN DITCHER—GASOLINE DRIVEN

LANNERT FIRE ALARM BOX

the weight when the lever is pulled down.

The shaft of one of the gears extends through the brass frame underneath the glass and has secured to it the hard rubber wheel N, provided with teeth to correspond to the number of the box.

To the frame is also secured the hard rubber plate O provided with two phosphor bronze springs, one of which extends over the wheel and is provided with a roller at its extreme end so that on the rotation of the wheel its projection will engage the roller and raise the platinum point of the upper spring away from the platinum point of the lower spring, first, however, producing a sliding motion of the contacts to keep them clean before breaking the circuit so that the circuit is broken and closed the proper number of times to correspond to the number of the box, and finally the last action of the movement short circuits the box so that the current does not pass through the platinum points, but goes through the shunt. An electromagnet P under the round case is provided with a hammer, bell and armature to be used for signaling. A porcelain base is secured to the inside of the square case and is provided with the three parts of a plug switch so that in testing the line on either side of the box can be grounded by taking out of the hole the plug Q and placing it in either of the holes between plate R and plate S or between plate R and plate T, but it is imperative that the plug should not remain in either of these holes and consequently is made sufficiently long to prevent the door from closing, thus notifying the operator to take out the plug. By placing the plug between plates T and S the box itself is out of service. The line wires are connected to the plates S and T, respectively, and the ground wire is connected to R. The wires are brought into the box through a conduit pipe which is screwed into the outer box either at the top or at the bottom. The Morse key is mounted on the same base for signaling.

To the left of the porcelain base is a cut-out switch U which consists of two hard rubber blocks V and V, on which are mounted the two levers of the switch. These two levers slide over two sets of contacts and are connected by a hard rubber handle, which normally extends to the inside of the door.

Two phosphor bronze springs W are shown between the rubber blocks V and V. These are so connected to the

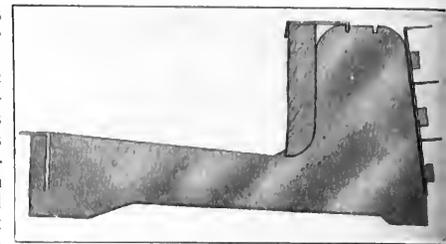

switch that when the inner door is closed the plug X slides in between the springs W and shunts the springs.

The object of the switch is to test the box and for which purpose a hard rubber switch plug is provided, the wires of which are connected to two cells of dry battery and then the plug is inserted between the spring W; then on pulling out the switch handle it will shift the levers on two other contact points and short circuits the fire alarm box from the line circuit; the box will then be on a local circuit. After putting the plug Q between the two plates T and S and pulling down the lever L the box will operate the bell P.

The taps of the bell should correspond to the number of the box to prove that the box is in condition.

The switch lever is then pressed down, the plug withdrawn and the plug Q taken out from between the plates T and S and inserted into a hole from which it had originally been taken and the doors locked.

It is impossible for the operator to close the door while the plug is in circuit and should he take out the plug and omit pushing in the switch handle, the closing of the door will press the switch handle back into proper posi-

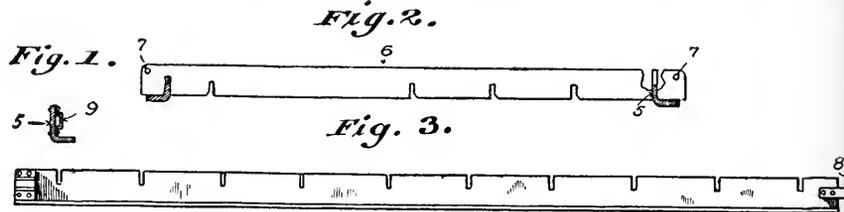

DIVIDING PLATE FOR CURBING

Reference to the illustration of the dividing plate for the curb and gutter forms will show the simple method of fastening the plank to the face of the curb. A short lug at the bottom and a hook over the top holds the plank rigidly in place. The manufacturers do not recommend steel for the face of the curb. The side rails at the back of the curbing fit into lugs on the dividing plate, as shown. The company also makes straight curbing forms of similar construction.

Service Pipe Cleaner

THE Staples cleaner, made by J. Fred Staples, 20 Ashland street, West

SIDE RAIL AND DIVIDING PLATE FOR SIDEWALK WORK

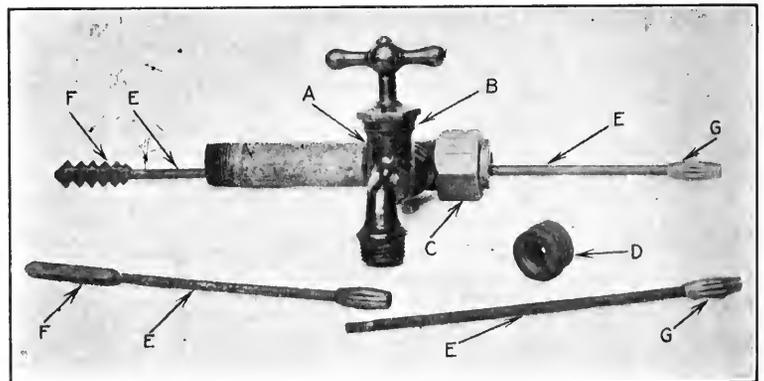

tion to cut in the line at the same time as the insulated plug X short circuits the springs W.

Steel Curb and Gutter Forms

JOS. UBBINK, Port Washington, Wis., manufactures steel forms for cement sidewalk and curb and gutter construction. The illustrations show the dividing plates and side rails. Fig. 2 shows a crosspiece or dividing plate showing the notches cut, making it adjustable at 6-inch intervals. Fig. 3 shows a rigid sidepiece showing cuts making expansion joints adjustable at one-foot intervals. Fig. 1 shows an end section with the socket into which the tongue fits. The rigid sidepieces are made of No. 10 gauge steel, which are bent to place in a hydraulic press. The crosspieces are made of No. 8 gauge steel, and the flexible sidepieces (for curves) are made of No. 12 gauge spring steel.

Somerville, Mass., meets a long-felt want in thoroughly cleaning the inside of water and gas service pipes of any size and length, removing rust and other obstructions without disturbing the pipes, thus saving much trouble and expense. A hundred feet can be cleaned in less than an hour. The set of tools consists of (a) cleaner, (b) faucet outlet for hose connection, (c) stuffing box, (d) stuffing box diaphragm rubber washer, (e) jointed rod, (f) cutter, (g) couplings on rod.

To use the cleaner shut off the water at cellar wall; put cutter (f) in cleaner, screw cleaner in stop and waste cock in cellar; turn on the water and open faucet at (b); push rod (e) forward and back, always turning to the right. Add on another section of rod and coupling until the entire length of pipe is cleaned. Always leave the water running at the faucet to carry off the rusty water and facilitate the cleaning of the pipe.

STAPLES SERVICE PIPE CLEANER

NEWS OF THE SOCIETIES

New England Water Works Association.—About one hundred members attended the meeting at the Hotel Kimball, Springfield, Mass., April 12, to listen to papers and discuss the subject of "Fire Protection." In the opening of the meeting President Allen Hazen introduced Mayor Lathrop, who described the conditions in Springfield previous to the recent increase in water pressure. E. V. French, Boston, presented a paper on "Desirable Pressure of Hydrants." He stated that the standard fire stream to-day is that discharged by a 1½-inch smooth nozzle, with a pressure at the base of the nozzle of 45 pounds, giving 250 gallons per minute. This, of course, means a much greater pressure at the hydrant. Even where hydrants are spaced at reasonable close intervals hose lengths of from 250 to 350 feet are necessary. The friction loss in the best hose, he said, is 14 pounds per hundred feet. Hence the hydrant pressure which best meets the conditions of business and manufacturing sections of cities of medium size or less is 80 to 100 pounds and for cities above medium size 100 pounds. Pipe sizes, the speaker said, should be such that the maximum amount of water needed in any section can be supplied without reducing the pressures at the hydrants more than about 10 pounds below the static pressures existing with everyday drafts.

Morris Knowles, Chief Engineer Bureau of Filtration, Pittsburg, Pa., spoke of the false economy in some small cities supplied by private companies in maintaining a small number of hydrants in order to reduce expense. Walter M. Richards, superintendent New London water works, spoke of insurance rates, and expressed the opinion that insurance companies should stand part of the expense of that portion of the water works maintained for fire protection. George W. Stacy, Marlboro, spoke of the improvement in pressure and number of hydrants in Marlboro, and said that they had no effect in reducing insurance.

National Association of Fire Engineers.—The annual convention of the National Association of Fire Engineers will take place in Racine, Wis., on September 19-22, inclusive. At a meeting of the board of directors in Milwaukee the following subjects for papers to be discussed were selected and chiefs designated to prepare them: "Fire Colleges," Chief Croker, of New York; "Fire Protection by Education Rather Than by Legislation," H. C. Henley, of St. Louis, Mo., and A. V. Bennett, of Birmingham, Ala.; "Electrical Propelled Fire Apparatus," W. H. Daggett, of Springfield, Mass.; "Motor and Gasoline Fire Apparatus," Arthur Aungst, of Alliance, O., and Thomas Ballentyne, of Savannah, Ga.; "Caliber of Fire Streams and Their Relative Value," Charles H. Fox, of Cincinnati, O.; "Compulsory Sprinkling of Basements," W. H. Loller, of Youngstown, O.; "Duties of State Vice-Presidents at International Conventions," John I. Hawk, of Moline, Ill.; "Rubber Tires—Solid vs. Pneumatic," Charles Swingley, of St. Louis, Mo.; "Best Method of Selecting Fire Hose," Harry Creamer, of Chicago, Ill.; "Equipment and Efficiency of Volunteer Fire Service," J. H. Runyon, of Morristown, N. J.; "Standard for Drills and Discipline," Terrence Owens, of Denver, Col.

National Good Roads Congress.—Commissioner Exum has received assurances from the following Mayors that they will be in attendance at the Congress, Birmingham, Ala., May 23-26: Mayor Frederick H. Kreismann, of St. Louis; Mayor Courtland S. Winn, of Atlanta, Ga.; Hilary E. House, Mayor of Nashville; Edward E. Burkhardt, Mayor of Dayton, O.; Martin Behrman, of New Orleans, La.; W. A. Gunter, Mayor of Montgomery, Ala.; T. O. Thompson, Mayor of Knoxville, Tenn.; George S. Marshall, of Columbus, O.; W. S. Gordon, Mayor of Jacksonville, Fla.

Citizens' Committee on Safety, New York City.—A Fire Prevention Bureau has been opened in the Charities Organization Building, 105 East Twenty-second street, New York. The bureau is planned to be a permanent contribution to the city's civic bodies, as a result of the Asch Building fire disaster. The purpose is to create a general clearing house on fire-trap information, on the ways to prevent fires and on the manner in which public officials are carrying out the fire protection laws. The following officers were elected: Henry L. Stimpson, president; Peter J. Brady, vice-president; John A. Kingsbury, secretary, and George W. Perkins, treasurer. It is the intention of the Bureau to make a recurrence of the conditions at the Asch fire impossible.

Southwestern Electrical and Gas Association.—The convention will be held in the Municipal Auditorium, Houston, Tex., April 27-29. The meeting will be called to order by President W. B. Tuttle, San Antonio, and the welcoming address will be made by Mayor Baldwin Rice. A new feature of the Houston meeting is the inauguration of the first electrical show in the Southwest, which will be participated in by the manufacturers of the United States who are members of this association. Exhibits will be more numerous and interesting than ever before, including the latest devices in departments of electric lighting, street railway and gas. Among the papers to be presented will be one on the "Investigation and Care of Return Currents," by George H. Clifford, general manager Northern Texas Traction Company, Fort Worth, Tex.

American Society of Mechanical Engineers.—The local committee of the American Society of Mechanical Engineers—E. M. Herr, chairman; Elmer K. Hiles, secretary—having in charge the preparations for the convention of the society, which will be held in Pittsburg, Pa., May 30 to June 2, inclusive, has nearly completed the work of arranging the programme for each day during the meeting. Professional sessions will be held in the Lecture Hall of the Carnegie Institute, near the headquarters, Wednesday morning and evening, Thursday and Friday morning. In the meantime there will be a number of inspection trips to various industrial plants in the vicinity, a boat excursion for the members and ladies up the Monongahela River, a reception and ball at the Hotel Schenley on Thursday evening, and finally, on Friday evening a smoker and entertainment, given by the Engineers' Society of Western Pennsylvania in their rooms in the Oliver Building. A carefully prepared programme for the entertainment of the lady visitors has been arranged by a committee of ladies from Pittsburg and vicinity, which includes a number of social functions.

Virginia Avenue Improvement Association.—Articles of association were recently filed for a unique association formed of 38 residents of Virginia avenue, Detroit, Mich. The total subscribed capital is \$30,550, the amount authorized \$45,000. The money is to be used for the buying of property on which the association holds options for beautifying the approaches to the avenue and for taking general care of the street, its alleys, trees, shrubbery, etc. The avenue already has the reputation of being one of the handsomest in the city. It is proposed to widen the street to about 120 feet at both approaches, and to build an attractive red brick wall of Virginia colonial design, 80 feet in width, in the center, having driveways curve into the roadway proper on either side of the wall, through a garden of plants and shrubbery, which will effectually conceal the thoroughfares from view. Walls will also be continued beyond the sidewalks. On each side of the approaches, 50 feet deep at the Woodward avenue entrance and 42 feet deep at the Hamilton Boulevard entrance, will be reserved and transformed into parks, and when these have been beautified they will be dedicated to the city. The plans for the improvements have been prepared by the architect, George V. Pottle, who is a member of the association. Application will also be made for a change in name for the three blocks reaching from Woodward avenue to Hamilton Boulevard from Virginia avenue to Virginia Park.

Pennsylvania Gas Association.—The third annual convention was held in the Auditorium, Philadelphia, April 12-14. The following officers were elected: President, C. W. Butterworth, Milton; first vice-president, Herbert Ganser, Norristown; second vice-president, W. R. Rhoades, Williamsport; secretary and treasurer, William H. Meritt, Lebanon; council, C. B. Bains, Ardmore; L. S. Williams, Harrisburg; John A. Frick, Allentown.

City Club, St. Paul, Minn.—A popular meeting arranged by the club to sound public sentiment on the proposed city plan prepared under the club's direction by John Nolen aroused a great deal of enthusiasm and brought out an attendance of about 500 citizens. Louis Betz, president of the City Club, presided. Mr. Betz said the idea of beautifying the city proposed by the city plan does not contemplate tying pink ribbons to the lamp posts and petitioning the Park Board to plant a few flowers in Rice Park. It means rather the enhancing of real estate values and making the city attractive to the traveler, so it will not be necessary to go abroad to spend his money. He said no one would build a house without a plan, and in building a city it also was necessary to have a comprehensive plan. He referred to the civic improvement being made in Washington, D. C., the purpose of which is to make a city reflecting the character of the country. He thought St. Paul should be made a city which would reflect the character of the great State of Minnesota. President Betz also read a paper by John Nolen, the city plan expert, covering the idea of regulating the city by districting it, thus providing for industries, retail stores, jobbing houses, public buildings and residences according to their respective needs. Mr. Nolen showed this plan in some cities has more than doubled the value of property in the various districts.

Calendar of Meetings

- April 27-28.
Good Roads Association of Florida.—Annual Meeting, Tallahassee. C. L. Bittinger, Secretary, Ocala, Fla.
- May 15-17.
National Conference on City Planning.—Philadelphia, Pa.—Flavel Shurtleff, Secretary, 19 Congress street, Boston, Mass.
- May 17.
Massachusetts Highway Association.—Quarterly Meeting in conjunction with the New England Conference on Street Cleaning, Springfield, Mass.
- May 17.
New England Conference on Street Cleaning.—Springfield, Mass.—Corresponding Officer, Carol Aronovici, 55 Eddy street, Providence, R. I.
- May 18-19.
Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25.
National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26.
National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 25-26.
League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2.
National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14.
National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-10.
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 11-16.
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- August 15-18.
Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 19-22.
International Association of Fire Engineers.—Annual Convention, Racine, Wis.
- September 19-22.
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirtieth street, New York City.
- October 4-6.
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

PERSONALS

- BERGER, F. J., has been elected Mayor of Eugene, Ore.
- BLOOMQUIST, H. T., has been elected City Engineer of Mankato, Minn.
- DYER, A. E., County Surveyor of St. Louis County, Minnesota, is also City Engineer of Hibbing.
- H. J. HANDLE has been elected Mayor of Denver, Colo.
- KELSEY, LOUIS C., civil and hydraulic engineer, of Salt Lake City, has been engaged in an investigation for the Mayor and City Council of Burley, Idaho, of a water supply and to make recommendations as to a water works system.
- LADOMUS, B. G., has been re-elected City Engineer of Chester, Pa.
- MESIROFF, J. A., has been appointed City Engineer to succeed Chas. J. Poetsch.
- MYERS, DR. GEO. T., has been appointed City Physician of Norfolk, Va.
- PALMER, W. K., & Co., Engineers, of Kansas City, Mo., have been engaged to remodel the water works systems and install electric lighting plants at Vermillion, S. D., and Anita, Ia.
- RETTIG, GEO., landscape architect of Cleveland, Ohio, gave a lecture recently, at Youngstown, on trees. Mr. Rettig spoke of the municipal regulation of tree care and tree planting in Cleveland.
- RODNEY RICHARD S., an attorney of New Castle, Del., has been elected Mayor.
- SCHROTH, JULIUS R., has been elected Mayor of Winona, Minn.
- SCOTT, J. P., was the successful candidate for Mayor of Cumberland, Md., on the Citizens' ticket.
- THUM, WM., is the new Mayor of Pasadena, Cal.
- WADHAM, JAMES E., has been elected Mayor of San Diego, Cal.

MAYORALTY ELECTIONS

ILLINOIS

- Chicago—Carter H. Harrison.
East St. Louis—Chas. S. Lambert.
Peoria—Edward Woodruff.
Springfield—John S. Schnepf.
Galesburg—K. Sanderson.
Moline—Martin Carlson.
Geneseo—John H. O'Brien.
Macomb—John M. Keefer.
Oneida—G. L. Burt.
Freeport—C. J. Dittmar.
Quincy—John F. Garner.
Rock Island—Harry M. Schriver.
Belleville—Fred J. Kern.

KANSAS

- Fort Scott—W. E. Brooks.
Kansas City—J. E. Porter.
Tonga—Joseph H. Dreisbach.
Mapleton—C. C. Goss.
Wichita—J. X. Graham.
Topeka—Mayor Billard, re-elected.
Ottawa—W. E. Wood.
Leavenworth—Albert Doeg.
Emporia—Frank McCain.
Salina—C. B. Kirtland.
Hutchinson—Frank Vincent.
Atchison—C. D. Walker.

WISCONSIN

- Appleton—Dr. J. V. Canavan.
Janesville—John C. Nichols.
Fond du Lac—Frank J. Wolff.
Ashland—Dr. J. M. Dodd.
Whitewater—David Zuill.
Oshkosh—John Banderob.
La Crosse—John Deugler.
Racine—W. S. Goodland.
Bay City—Dr. Roy O. Woodruff.

MISSOURI

- Palmyra—James W. Owsley.
Canton—Frank C. Millsbaugh.
Jefferson City—Cecil W. Thomas.
Wellsville—Dr. S. S. Cox.
Joplin—Guy T. Hume.

TRADE NOTES

Cast Iron Pipe.—Chicago: Business has not been quite as active as for several weeks. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. San Francisco: The tonnage since April 1 has been moderate, but conditions are considered favorable for an active summer. Many Coast cities are making preliminary preparations for auxiliary systems for fire protection. Quotations: 4-inch, \$35; 6 to 12-inch, \$34. Birmingham: Plants now running are well supplied with orders, and it is believed that prices will be higher. Quotations: 4 to 6-inch, \$23; 8 to 12-inch, \$22; over 12-inch, average \$21. New York: Trade is dull, with only small lettings in sight. Quotations: 6-inch, carloads, \$22.

Lead.—Market is dull. New York, 4.30c.; St. Louis, 4.45c.

Fire Prevention Company.—The Croker National Fire Prevention Engineering Company, 562 Fifth avenue, New York City, is a new corporation organized by former Chief Croker of the New York Fire Department. Mr. Croker purposes to provide for owners and lessees of property a system under which an inspection can be made by trained experts. He expects to have 300 men connected with the bureau by the end of a year, for he believes that the idea is capable of development on many lines. The inspectors will be drawn from retired officers of the Fire Department. It is the plan of the new company to provide patrols who will take charge of theaters, hotels, apartment and tenement houses, asylums and institutions in which numbers of persons may be gathered for employment, worship or amusement. There will also be a division assigned to private houses. Written reports will be made to owners and occupants, in which will be pointed out the dangers of fire from defective heating apparatus, electric light wiring and other conditions which have been the cause of fires. Large private estates are to be inspected along the same lines, and their employees organized into fire brigades and drilled for emergencies. The services of the organization will be at the disposal of any city or town that may be about to organize a municipal fire department, or where a reorganization may be found to be desirable.

Use of Cement.—The Chicago Portland Cement Company, 108 La Salle street, Chicago, Ill., publishes a handsomely illustrated booklet called "Chicago AA" Facts. The illustrations show many uses of cement, among them some steps and walls in Lake Park, Milwaukee, Wis., designed by A. C. Clas, of the Milwaukee Park Board.

Reinforced Concrete Sewers.—Walter C. Parmley, member American Society Civil Engineers, announces that the business hitherto carried on by him as consulting engineer and engineer for designing, constructing and manufacturing reinforced concrete sewers and other structures, will hereafter be conducted under the firm name of Parmley & Nethercut. Edgar S. Nethercut, member American Society of Civil Engineers, will have his headquarters in the Monadnock Block, Chicago, Ill., while Mr. Parmley will remain as hitherto at the Everett Building, 45 East Seventeenth street, New York City.

Traction Engines.—The Joshua Hendy Iron Works, San Francisco, Cal., has taken over the plant of the Johnson Tractor Company's plant, with the intention of manufacturing traction engines. The machine work will be done at the large plant of the Joshua Hendy Iron Works at Sunnyvale, Cal., the Johnson shop being used as an assembling plant. F. D. Calkins will have charge of the traction engine department.

Water Works Company.—At a meeting of the stockholders of the Port Jervis Water Works Company, Port Jervis, N. Y., April 13, the following directors were elected: Dr. W. L. Cuddeback, Dr. Henry Hardenbergh, Dr. Charles N. Skinner and Messrs. Jacob Kalmbach, Charles W. Snyder, Jacob F. Pobe and Peter E. Farnum. The directors met and elected officers as follows: President, Dr. W. L. Cuddeback; vice-president, Dr. H. Hardenbergh; treasurer, Alfred Marvin; secretary, Christoph Graebner.

Fort Wayne.—Ralph E. Avery, Concordia, Kan., has published a handsome booklet of illustrations of scenes in Fort Wayne, Ind., together with some descriptive matter. The illustrations are of public buildings, industrial plants, outdoor scenes and private residences. On the cover is a blank space in which is to be inserted an illustration of the plant of the company which distributes the booklet among its customers and friends; our copy was the plant of the Fort Wayne Electric Works.

Steel Flumes.—T. C. Egleston, sales manager, 714 Ideal Building, Denver, Col., has issued a booklet describing the Maginnis galvanized steel flume and illustrating a number of installations. The flume is made by a flat sheet of galvanized steel 30 inches wide and as long as required for the perimeter of the flume and passing it through a forming machine that leaves the sheet in a semi-circular form with a bead rolled in each edge of the sheet. A steel rod of the proper size to carry the weight of the flume, and of the right length, is threaded at both ends for a nut, formed in semi-circle, passed around the outside of the flume and lies in the bead when the flume is in place. A steel channel of the proper size and length is also formed in a semi-circle and rests over the bead on the inside of the flume when the flume is in place. When the flume is assembled and the nuts tightened, the rod draws tight in the hollow of the bead and the channel presses with the same force on the two edges of the bead, thus forming a water-tight joint. No rivets or solder are used.

Blueprint Machine.—The Shaw Blueprint Company, 9 Campbell street, Newark, N. J., has placed a continuous blueprint machine on the market which is claimed to operate at a low cost for current. The Shaw operates by a single arc lamp, which uses 15 amperes at 110 volts, or 7½ amperes at 220 volts, traveling up and down continuously in the center of a half cylinder of glass, while the paper and tracing are carried around by an endless canvas band. All that is necessary is to insert the ends of the paper and the tracing between the guide rollers and the machine does the rest. The printing speed of the 42-inch machine is said to be 2 feet per minute, using rapid paper. The machine only requires a space of 2 feet 6 inches square and head room of 8 feet.

Quality or Price?—Under this caption the H. Mueller Manufacturing Company, Decatur, Ill., manufacturer of water works supplies, has published a little pamphlet containing extracts from an address presented and discussed at a gathering of big buyers. It met with almost unanimous approval as representing the growing prevalent conviction that quality and not price is entitled to first consideration. The argument stated briefly is axiomatic, though often forgotten, that the cost of installation of a good article is no more than that of a poor one and the cost of maintenance is less.

Road Asphalt.—The Indian Refining Company, whose headquarters have heretofore been in Cincinnati, has decided to move its executive department to New York. A branch office, to take care of Western business, will be maintained in the First National Bank Building, Cincinnati.

Gasoline Rock Drill.—The Scott Gasoline Rock Drill Manufacturing Company, St. Louis, Mo., has filed articles of incorporation, with \$500,000 capital stock. It is the intention of the company to establish a factory in St. Louis for the manufacture of a drill invented by Louis L. Scott. The drill is attached directly to the cylinder of a gasoline engine, doing away with the use of a steam plant, air compressor and hose in drilling rock and other substances. The machine is being manufactured under contract at present. The incorporators are: Louis L. Scott, John R. Williams, Samuel D. Martin and others.

Cast Iron Pipe.—The United States Cast Iron Pipe and Foundry Company has moved its Chicago office from the Rookery Building, where it has been located for many years, to the People's Gas Building, rooms 923-927, where much more desirable quarters have been engaged.

Ornamental Lamp Standards.—The Flour City Ornamental Iron Works, Minneapolis, Minn., has in press a new catalogue de luxe of its lamp standard department. The brochure will contain a detailed account of the various designs manufactured by the company—Corinthian, Egyptian, Capital and Boulevard. Reproductions of these on a scale of half an inch to the foot will appear. The text will contain the detailed specifications for the standard.

Appliances for Fire Prevention and Protection.—The Chief of the Fire Department of a European city, who is also an official of an international competition for firemen and appliances adapted for fire prevention and protection to be held in connection with an international exposition that opens April 29, has asked an American Consul for the names of the leading American Fire Chiefs and the most important American manufacturers producing appliances that have to do in any way with fire prevention and protection. The information is desired in order that printed matter and notices regarding the competition in question may be forwarded to them. Address No. 6540, Bureau of Manufactures, Washington, D. C.

Cotton Waste Substitute.—The Sanitary Rag Company, Kalamazoo, Mich., packs washed wiping cloths in bales of from 100 to 500 pounds, to be used about machinery as a substitute for cotton waste. The rags are light in weight, running five to seven pieces to the pound, free from buttons, hooks, eyelets, starchy parts, etc.

Auto Engine Tested.—The new auto pumping engine purchased for the Lansing (Mich.) Fire Department from the Webb Motor Fire Apparatus Company was tested recently. After one of the tests it was found that the suction pipe contained about a pound of oakum, which had presumably been used at some time in packing the hydrant. With two lines of hose, each 200 feet long, 740 gallons of water were thrown per minute. President John Bohner and other members of the Board of Police and Fire Commissioners were very much pleased with the engine.

Mexican Gas Plant.—The large gas plant and distributing system of the Guadalupe Gas Company, Guadalupe, Mexico, will be finished and placed in commission some time next month. The mains have been laid in all of the principal business and residence streets and many buildings have already been equipped for using the new fuel. The plant is modern in every respect. The company is composed of San Francisco (Cal.) men, and the concession from the State and Federal Governments under which it is operating is unusually liberal. The installation of the plant was done under the direction of W. A. Aldrich, of Grand Rapids, Mich.

Small Engine and Generator Sets.—The Crocker-Wheeler Company, Amherst, N. J., has placed on the market a small steam engine and direct current generator in one unit. This generating set is advocated for the production of electric current for illumination in districts where kerosene lamps would otherwise have to be used. The steam engines are Giles Type E, made by the United States Rapid Fire Gun and Power Company, Derby, Conn. The generators vary in capacity from 1.75 to 21 kilowatts.

Creosoting Plant.—The Atlantic Coast Line Railroad has decided to build a creosoting plant at Gainesville, Fla., of sufficient size for treating all of the timber used on the system. Citizens subscribed \$5,000 to purchase the land. It is stated that 100 men will be employed on the work.

Contracting Engineers.—Frederick L. Cranford, James C. Meem and H. P. Moran have opened offices at 177 Montague street, Brooklyn, and will continue their business of contracting engineers at that address.

Granite Paving Blocks.—The granite paving blocks quarried by the Harris Granite Quarries Company, Salisbury, N. C., are claimed to be the strongest, as well as the best shaped of any made in the United States. Six samples from the company's Balfour quarry, Rowan County, North Carolina, recently tested at the United States Arsenal, Watertown, Mass., showed an ultimate crushing strength per square inch of from 43,670 to 51,990 pounds. The next strongest samples from other quarries broke at from 27,279 to 29,347 pounds per square inch.

Delivery of Pumps Delayed.—Application for an extension of the time for delivery of two 20,000-gallon electrically driven centrifugal pumps, for which they were awarded contracts by the Minneapolis, Minn., water works department, has been received from Henry R. Worthington, of New York, by City Engineer Andrew Rinker. The contract provides for a delivery before June 1 and imposes a penalty for each day of delay after that date. The contractor now asks an extension until August 15.

NEW CORPORATIONS

The Acme Hoisting Machine Company, St. Louis, Mo.; capital \$50,000. Incorporators: F. R. McCune, Geo. S. Cornell and John M. Patke. The company will manufacture hoisting and power, illuminating, excavating and carrying machinery.

The C. A. Wood Preserver Company, St. Louis, Mo.; capital \$10,000. Incorporators: M. F. Gerhard, H. H. Gerhard, H. A. Giesen and others. The company will manufacture wood preservers and wood preserving processes.

Hopeman Engineering and Construction Company, Moorhead, Minn.; capital \$25,000. Incorporators: A. M. Hopeman; vice-president, Ralph Pederson; treasurer, A. H. Erickson; secretary, P. H. Pederson. It will be capitalized for \$25,000.

Bald Mountain Portland Cement Company, Rome, Ga.; capital \$1,000,000. Incorporators: J. L. Bass, J. N. King, B. T. Haynes, W. J. Griffin and E. A. Heard, of Rome; M. M. Jack, of Dalton; S. W. Palmer, of Millen, and E. C. Lester, of Atlanta.

The Farmington Light & Power Company, Farmington, Ill., has been incorporated with a capital stock of \$30,000. The incorporators are Theo. Bass, M. M. Anderson, H. E. Worden and A. L. Thompson.

Swatard Electric Light, Heat & Power Company, Scranton, Pa.; capital \$5,000.

Auburn Light, Heat & Power Company, Auburn, N. Y.; capital \$900,000; to manufacture gas and electricity for supplying the municipalities of Auburn, Aurelius, Cayuga, Owasco, Sennett, Fleming, Skaneateles, Seneca Falls, Fayette, Waterloo and Geneva. Incorporators: J. Alward Seymour, Dr. Frederick Sefton, D. Edwin French, Geo. W. Bowen and Henry L. Coleman, Auburn, and Irving Rouse, Rochester; E. H. Palmer, Lansing; G. Hoskins and Henry O. Palmer, Geneva.

Croker National Fire Protection Engineering Company, 562 Fifth avenue, New York City; capital \$10,000. Incorporators: Edward F. Croker, Charles Thorley and David M. Neuberger, all of New York.

The Red Oak Deep Well Company, Red Oak, Tex.; capital \$3,500. Incorporators: G. L. Ligon, F. F. Beddo, H. Harrison and others.

The Green Deep Well Co., Sherman, Tex.; capital \$3,000. Incorporators: Dupon B. Lyon, R. A. Chapman, Jr., W. L. Green and others.

William P. McDonald Construction Company, Manhattan, N. Y.; construction work of all kinds; capital \$25,000. Incorporators: A. Forhay, 13-21 Park Row; Russell Goldman, 1200 Madison avenue, both of New York City; John I. McDonald, 728 Marcy avenue, Brooklyn.

Bibb Sewer Pipe Company, Macon, Ga.; capital \$50,000. Incorporators: O. J. Massee, Jr., J. P. Stetson and A. S. Bates.

The Honey Grove Sewer Company, Honey Grove, Tex.; capital \$10,000. Incorporators: J. H. Whattley, Sam G. Duff, F. M. Kemp.

The Kerbaugh-Empire Company, Valhalla, N. Y.; capital \$4,000,000. Incorporators: Edward D. Adams, William Barclay Parsons, William R. Coade, Alfred Skitt, Eugene Klapp and Lamar Hardy, of New York City; N. S. Kerbaugh, Robert Cassatt, G. Dallas Dixon, Jr., of Philadelphia.

The Baltimore-Schub Concrete Corporation, Thomas G. Frame, Jr., Dover, Del.; capital \$600,000. Incorporators: S. H. Moore, Harry M. Lindsay, N. E. Stubbs, all of Baltimore, Md.

The Paintsville Water & Light Company, Paintsville, Ky.; capital \$20,000. Incorporators: H. M. Stafford and John E. Buckingham.

Hansen Continuous Chemical Fire Apparatus Company, St. Louis, Mo.; capital \$50,000. Incorporators: F. William Runde, Edward E. M. Hansen, L. A. Ragan.

The Central Construction Company, Lexington, Ky.; capital \$10,000. Incorporators: John M. Kelley, Howard K. Bell and others.

The Warner Construction Company, Muskogee, Okla.; capital \$50,000. Incorporators: C. C. Goodman, Fort Smith; Fred E. Turner, Muskogee, and Campbell Russell, Warner.

The Fogleman & Turner Company, Oxford, N. C.; capital \$25,000. Incorporators: W. H. Fogleman, L. B. Turner and Leha F. Wyatt.

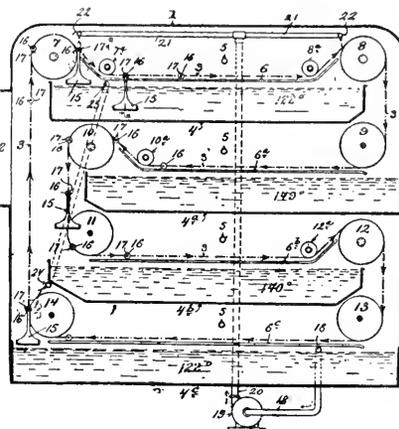

Western States Gas and Electric Company, Chicago, Ill.; capital \$15,000,000; Delaware corporation.

The Federal Engineering Co., Muskogee, Okla.; capital \$25,000. Incorporators: Chas. E. Creager, Thos. F. Murdock and Walter G. Humphrey.

PATENT CLAIMS

989,235. **AUTOMATIC WATER-PURIFIER.** George F. Day, San Francisco, Cal. Serial No. 565,248.

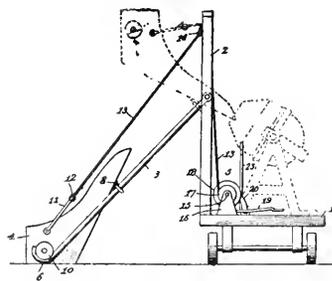

The combination in a water-purifying apparatus, of tanks adapted to independently contain unpurified water and chemicals, independent valve chambers through which the water and chemicals may flow, valves contained within the chambers designed to

deliver a proportional mixture, a unitary connection common to both valves, a purifier and filter through which the mixed liquids are caused to pass, a purified water-container, means to deliver the water thereto, and means by which the valves are automatically simultaneously opened and closed.

990,194. **LOADER FOR CONCRETE-MIXERS.** James DuShane, South Bend, Ind. Serial No. 556,084.

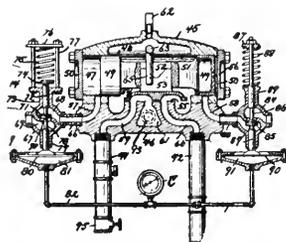

A loader comprising an elevating bucket, a hoisting mechanism therefor, and pivoted

tracks, said tracks being movable independently of each other and having their free ends held in parallel relation by the bucket.

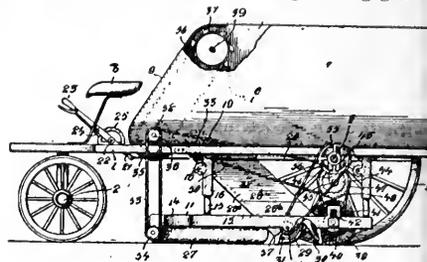

990,085. **SUBTERRANEAN PUMPING SYSTEM.** Frederick C. Weber, New York, N. Y. Serial No. 473,516.

In a pumping system, the combination of a source of fluid pressure supply, with a liquid chamber, a pipe connection between said supply and said chamber, a reversing valve in said pipe connection for alternately admitting pressure to and exhausting the same from said chamber, means for shifting said valve comprising a duplex

piston, a casing therefor, a bypass in each head of said piston to permit the slow accumulation of pressure on each side thereof and thereby balance said piston, means controlled by the degree of pressure or vacuum in said chamber and pipe connection for releasing said accumulated pressure alternately from opposite ends of said duplex piston.

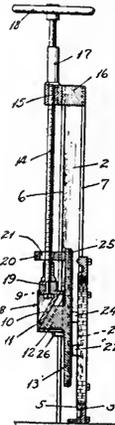

989,377. **STREET-SWEEPER.** Albert S. Machen, Norfolk, Va. Serial No. 541,320. A street sweeper embodying a main frame carrying a receptacle, a carrier frame arranged below and vertically adjustable on said main frame, a pair of rearwardly converging front brushes mounted on the carrier frame, a transverse brush disposed in rear of said front brushes and also mounted on the carrier frame, a casing having gath-

ering trays extending forwardly and rearwardly between the front and transverse brushes to take up the dirt gathered thereby, said casing comprising relatively adjustable sections mounted respectively on the main and carrier frames, gearing for driving the brushes and a conveyor movable through said casing for elevating the dirt gathered by both trays into said receptacle.

989,201. **VALVE OR GATE.** Frank P. Snow, Los Angeles, Cal., assignor to Kellar-Thomson Manufacturing Company, Covina, Cal., a Corporation of California. Serial No. 570,245.

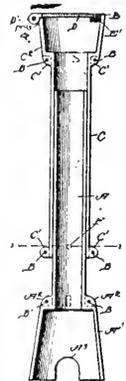

A valve plate having an opening, a member guided transversely with respect to said

opening and having an inclined slide, a disk adapted to close said opening and guided in said slide, a means for arresting the transverse movement of said disk to enable said slide to force said disk laterally toward said opening.

988,974. **STOP-COCK BOX, HYDRANT AND STREET-WASHER.** Frederick Chapman, Brooklyn, N. Y. Serial No. 562,867.

A device of the kind described, comprising an upper section having an expanded top, said top having an interior lug provided with a threaded aperture, a cover hinged to said top, a screw carried by said

cover and adapted to engage the threaded lug, a lower section having an expanded base, said upper and lower sections telescoping, and a set screw for securing said sections in any desired adjustment, each section consisting of two longitudinal halves bolted together.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Florida	Jacksonville	Apr. 28, 10 a.m.	Resurfacing St. Johns ave. about 27,000 sq. yds. with as. mac.	Gail L. Barnard, County Engr.
Ohio	Cincinnati	Apr. 28, noon	Improving the Eight Mile road in Anderson township	Stanley Struble, Pres. Bd. Co. Comrs.
Ohio	Geneva	Apr. 28, noon	Improving streets by grading, draining, curbing and paving with brick on concrete foundation and laying storm sewers.	W. E. Morgan, Clk. Village Council.
Missouri	St. Louis	Apr. 28, noon	Installing a municipal asphalt plant.	W. B. Dryden, Secy. B. P. Imp.
Ohio	Cincinnati	Apr. 28, noon	Grading, setting cement curbs, paving roadway with brick and constructing drains and inlets in portion of Ludlow ave.	John J. Wenner, Clk. B. P. Serv.
Ohio	Toledo	Apr. 28, noon	Grading portion of Albert street and paving central 20 ft. with tar mac. together with nec. curb, retain. walls, drainage, etc	Fred. Shane, Secy. Bd. Pub. Serv.
Manitoba, Can.	Brandon	Apr. 28, noon	Paving various streets with wood block, asphalt block, sheet asphalt, bitulithic or vitr. brick.	R. E. Speakman, City Engr.
Minnesota	Minneapolis	Apr. 28, 7:30 p.m.	Furnishing a stone crushing plant.	Henry N. Knott, City Clerk.
Connecticut	New Haven	Apr. 28	Laying sidewalks of Portland cement in various streets.	C. W. Kelly, City Engr.
Ohio	Springfield	Apr. 29	Construct. sidewalks and gut., and mac. portion of College ave	Jacob Klein, Dir. Pub. Serv.
Indiana	Terre Haute	Apr. 29, 11 a.m.	Grad. and pav. with gravel various roads in Vigo County.	Nathan G. Wallace, Audr. Vigo Co.
Pennsylvania	York	Apr. 29	Lay. about 4,000 ft. conc. curbing and guttering at Penn Park.	City Clerk.
Ohio	Marysville	Apr. 29	Constructing 2½ miles of road in Union Township.	Bert J. Shelton, County Audr.
Ohio	Marvina	May 1	Grad. and pav. with brick 2.12 miles of county road.	Commissioners Portage County
Indiana	Greencastle	May 1	Improv. 13,333 ½ ft. of macadam road in Madison township.	D. V. Moffett, Aud. Putnam Co.
Indiana	Versailles	May 1, 1 p.m.	Constructing 11,370 ft. of macadam road in Adams township.	Nicholas Volz, Aud. Ripley County.
Indiana	Williamsport	May 1, 1 p.m.	Constructing a gravel road in Kent township.	David H. Moffit, Aud. Warren Co.
New York	Albany	May 1, 1 p.m.	Paving about 8,500 mi. of roads in various counties.	S. Percy Hooker, Chm. Hwy. Com.
Indiana	Fowler	May 1, 1 p.m.	Constructing free stone roads in Benton County of crushed blue stone, together with bridges and drainage.	Lemuel Shipman, Audr. Benton Co.
Pennsylvania	Springdale	May 1, 8 p.m.	Constructing a system of water lines about 36,660 lin. ft.; constr. a 350,000 gal. reservoir; grading about 30,000 cu. yds.	R. J. Campbell, Chm. Com. Council.
Minnesota	Everdell	May 1, 2 p.m.	Grading 2 miles in Nelson township.	Herman G. Fruetel, Town clerk.
Pennsylvania	Bradford	May 1, 5 p.m.	Paving one street and building two bridges.	E. C. Charlton, City Clerk.
New York	New York	May 1, noon	Furnishing 12 street sweeping machines.	Wm. A. Edwards, Comr. St. Clean.
Pennsylvania	Plymouth	May 1, 7:30 p.m.	Repairing Main Street with vitrified brick.	John Lynch, Chm. Street Committee.
Washington	Hoquiam	May 1	Constructing a plank roadway 20 mi. long, est. cost \$60,000.	Board County Commissioners.
New York	Pittsfield	May 1	Paving various streets with vitrified brick.	Paving Com., City Council.
Pennsylvania	Olyphant	May 2, 8:30 p.m.	Paving with vit. brick and curbing with stone one street about 9,105 sq. yds. paving; 6,455 lin. ft. curbing.	Thos. F. O'Hara, Boro. Secy.
Minnesota	Two Harbors	May 2, 10 a.m.	Grading two miles of State road.	John P. Paulson, County Auditor.
Indiana	Bedford	May 2	Constructing roads Nos. 1 and 2.	County Comrs.
New York	Hudson	May 2, 10:30 p.m.	Repairing portion of Warren Street with vitrified brick.	Commissioners Public Works.
New York	Niagara Falls	May 2	Repairing and repaving various streets.	City Clerk.
Delaware	Wilmington	May 2	Constr. water-bound mac. road about 3 mi. long, and resur. 4 mi.	F. A. Price, State Hwy. Comr.
Mississippi	Columbus	May 2	Constr. about 6,000 lin. ft. concrete curb and gutter, or granite curb and concrete gutter.	E. S. Donnell, Mayor.
Iowa	New Hampton	May 3	Constr. 12,000 sq. yds. Portland cement paving; and 1,600 ft. cement curb.	F. B. Stuike, City Clerk.
Florida	Jacksonville	May 3, 10 a.m.	Constructing about 13,000 sq. yds. asphalt macadam resurfac.	Gail L. Barnard, County Engr.
New York	Binghamton	May 3	Paving portion of Water street with vitrified brick.	S. W. Murray, City Clerk.
Missouri	Fulton	May 4	Construct. 9,000 yds. brick pavement on 5-in. concrete foundation; 12,000 yds. mac. with binder and 10,000 ft. con. curb.	P. D. Thurmond, City Engineer.
Ontario, Can.	Ft. William	May 4, 5 p.m.	Paving with asph. blk., sheet asph. or bit. about 14,100 sq. yds.	John Wilson, City Engr.
New York	Seneca Falls	May 4, 2 p.m.	Paving Main and Bayard sts., including 12,500 cu. yds. of excavation; 17,000 lin. ft. of curbing; 15,000 lin. ft. of 3-in. drain tile; 5,000 lin. ft. vitrified pipe; 42 catch basins; 25,000 sq. yds. brick or macadam pavement.	J. W. Brennan, Village Engr.
New York	New Rochelle	May 4	Paving with macadam and constructing curb, gutter and sidewalks on various streets.	Richard Lathers, Jr., Chm. B. P. W.
Ohio	Cleveland	May 4, noon	Grad., drain., curb., paving with brick and imp. var. streets.	A. B. Lea, Dir. Pub. Serv.
New Jersey	New Brunswick	May 4, 11 a.m.	Resurfacing portion of street, 3,000 ft. long and 60 ft. wide, with asphaltic concrete.	Peter Hendricks, D. B. C. Freeholdrs Board Public Improvements.
Missouri	St. Louis	May 5, noon	Reconstructing various streets.	Chas. A. Johnson, County Auditor.
Indiana	Crown Point	May 5, 10 a.m.	Constructing various gravel roads in Lake County.	Stanley Struble, Pres. Bd. Co. Comrs.
Ohio	Cincinnati	May 5, noon	Improving Carthage avenue in Columbia township.	Edgar A. Stagg, Audr. Clay County
Indiana	Brazil	May 5, 11:30 a.m.	Constructing two gravel roads in Clay township.	
Dist. Col.	Washington	May 6, 2 p.m.	Furn. sheet asphalt for use on streets during year ending June 30, 1912.	Cuno H. Randolph, Commissioner.
Ohio	Elyria	May 8	Constructing brick pavements.	R. Moriarty, City Clerk.
Ohio	Barnesville	May 8	Paving Lincoln Street.	F. Waldo Hillis, City Clerk.
Indiana	Brookville	May 9, 1 p.m.	Constructing gravel roads in Franklin County.	Chas. A. Miller, County Auditor.
Florida	Jacksonville	May 12, 2:30 p.m.	Grading, curbing and paving with vitrified blocks of some standard brand various streets.	Philip Prioleau, City Engr.
Indiana	Rushville	May 13	Constructing gravel road 36,830 ft. long.	Joint Board Commissioners.
Kentucky	Cattlettsburg	May 15, 6 p.m.	Improving portions of various streets, including 14,555 lin. ft. curb and gutter and 20,305 sq. yds. paving.	H. Chatfield, City Clerk.
New York	Lackawanna	May 15, 8 p.m.	Paving with vitrified brick portion of Ridge Road.	John J. Monaghan, City Clerk
Tennessee	Memphis	May 16	Constructing 5.1 mi. gravel paving, 3.9 mi. tar macadam, 1.4 vitrified brick, 2.9 wood block or bit. and ½ mi. old stone.	Geo. C. Love, Comr. Dept. Sts. City Clerk.
Ohio	New Philadelphia	May 22	Paving the New Cumberland Road with brick.	The George Company, Ran. Bldg. Memphis, Tenn.
Mississippi	Hazelhurst	June 1	Constructing 58 miles of gravel roads in Copiah County.	
SEWERAGE				
Ohio	Cincinnati	Apr. 28, noon	Constructing main and lateral sewers.	John J. Wenner.
Ohio	Geneva	Apr. 28	Constructing storm sewers.	W. E. Morgan, Village Clerk.
Pennsylvania	N. Braddock	Apr. 28	Constructing sewers in portion of Jones ave. and 2 alleys.	C. A. Stewart, Boro. Engr.
Ohio	Fremont	May 1	Constructing 700 ft. of tile sewer in Linden street.	C. F. Bell, City Auditor.
Wyoming	Lusk	May 1, 8 p.m.	Constructing sewer system.	D. E. Goddard, Town Clerk
Minnesota	Clouet	May 1	Constructing sewers and water mains, including 13,600 cu. yds. excavation, 10,300 lin. ft. of 8-in. and 10-in. sewers, 12,000 lin. ft. 6-in. and 4-in. water mains.	City Clerk.
Indiana	Kokomo	May 1	Constructing about 12,935 ft. of intercepting sewer, from 10 to 48 inches diam.; with appurtenances and connections.	Ben. Havens, City Clk.
New Jersey	Elizabeth	May 1, 8:30 p.m.	Construct. 350 lin. ft. 10-in. sewer; 14 8x10-in. connec.; 3 manh.	N. K. Thompson, Street Comr.
Tennessee	Park City	May 1	Constructing sanitary sewers.	A. J. Queener, Recorder.
Pennsylvania	Springdale	May 1, 8 p.m.	Constructing a system of sewers, about 36,660 lin. ft.	R. J. Campbell, Chm. Com. Council
Alberta, Can.	Edmonton	May 2, 3 p.m.	Constructing 3,290 ft. of concrete sewer 10 ft. 6 in. in diameter.	A. J. Latoinell, City Engr.
Florida	Pensacola	May 2	Constructing 15,060 lin. ft. storm water drains from 10 to 66-in. in diam.; and 23,880 lin. ft. of san. sewers from 6 to 24-in.	John A. Merritt, Chm. B1 Bon1 Tr.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
SEWERAGE (Continued)				
South Dakota	Canton	May 2	Extending the sewer system at the Canton Insane Asylum	Dr. Harry R. Hummer, Supt.
Pennsylvania	Doylstown	May 5	Reconstr. the sewage disp. beds of the Doylstown Sewer Com.	Wm. Bishop, Supt.
West Virginia	Huntington	May 8, 1 p.m.	Constructing lateral 12-in. sewers in various streets	John Coon, Comr. Streets.
Kansas	Humboldt	May 8	Constructing 8, 10 and 12-in. vitrified pipe sewers	The J. L. Worley Co. Engrs., K. C.
Ohio	Elyria	May 8, noon	Constructing sanitary sewers, estimated cost \$27,000	C. S. Bath, Engr.
Ontario, Can.	Toronto	May 9, noon	Constructing about 13,196 lin. ft. low level interceptor	G. B. Geary, Mayor.
New York	Batavia	May 15, 10 a.m.	Constructing sewage disposal plant	K. B. Mathes, Chm. Bd. Sew. Com.
Oregon	The Dalles	May 15	Construct. a section of Dist. No. 1 sewer system, cost about \$225,000	L. T. Boyle, City Engineer.
South Dakota	Aberdeen	May 15, 8 p.m.	Construct. 1,860 ft. of 8 and 12-in. pipe sewers	F. W. Raymond, City Auditor.
Wisconsin	Baraboo	May 17	Constructing trunk sewers, 3,000 lin. ft. 30 and 27-in. pipe	A. H. Huebing, City Clerk.
California	San Jose	July 3	Construct septic tank for County hospital	City Clerk.
WATER SUPPLY				
Illinois	Toulon	Apr. 28, 7:30 p.m.	Constructing concrete storage reservoir for water supply system; deep well and force pumps with appurtenances and connect.	Arthur Shinn, City Clerk.
Oklahoma	Oklahoma City	Apr. 28	Sinking nine artesian wells in Tex., Cimarron & Beaver Counties	O. A. Brewer, Chm. S. B. Agr.
Florida	Fort Dale	Apr. 29, 10 a.m.	Constructing extension of water system	Construct. Quartermaster, U.S.N.
New Jersey	Skillman	May 1, 10:15 a.m.	Extending water system, together with necessary hydrants, gates, valves, etc., at Village for Epileptics	Jonas A. Fuld, Secy. Bd. Managers.
Sask., Can.	Scott	May 1	Drilling a deep well	Geo. M. Phillips, Sec'y.
Minnesota	Slayton	May 1, 8 p.m.	Constructing an extension to the water works system	B. H. Whitney, Village Recorder.
Minnesota	Cloquet	May 1, 8 p.m.	Furn. 9,200 ft. 6-in. and 3,000 ft. 4-in. c. i. water pipe & 43 manh	J. A. E. Grenier, City Clerk.
W. Virginia	Romney	May 1, noon	Installing system of water works. Est. cost \$15,000	A. N. McKeever, Mayor.
Minnesota	Mankato	May 1	Removing old boiler and furn. new boiler at pumping station	A. H. Sherer, City Clerk.
North Dakota	Grafton	May 1	Sinking a 6-in. artesian well	J. H. Johnson, City Auditor.
Ohio	Mansfield	May 2	Improv. w. w. by install. add. pumping equipment	Board Control.
California	Corning	May 2	Constructing w. w. and sewer system, cost about \$46,000	E. L. Randall, City Clerk.
New Jersey	Rahway	May 3, 8 p.m.	Furn. one 5,000,000 gal. horizontal, high-duty, cross-compound, crank and fly-wheel pumping engine	A. F. Kirstein, Supt. Bd. W. Comrs.
Ohio	Lakewood	May 9	Erecting an elevated steel tower on concrete base	E. R. Lieblein, Clk. Bd. Pub. Aff.
Ohio	Rockport	May 12	Constructing water mains	F. Feuchter, Clerk.
New York	New York	May 16, 11 a.m.	Construct. portions of the city tunnel of the Catskill aqueduct	Chas. Strauss, Pres. Bd. W. Sup.

Rushville, Ind.—County Commissioners are considering building of seven roads at cost of \$150,000.

Valparaiso, Ind.—Taxpayers of Pleasant Township have voted to construct 16 miles of gravel road to cost about \$77,000.

Burlington, Ia.—Council has instructed the City Engineer to prepare estimates for

paving contracts on Arch, Spring and Smith sts.

Baltimore, Md.—Eastern Railway Supply Co., 413 American Bldg., desires 10-ton steam road roller.

Baltimore, Md.—City Engineer Fendall with consent of the Board of Estimate will begin within few weeks work of paving 31st st., Maryland Ave. to St. Paul St. with macadam over the cobblestones; after being subjected to traffic the experiment proves satisfactory. Mr. Fendall will recommend that all residential streets be paved with macadam over cobbles.

Cumberland, Md.—Council has passed ordinances for paving four streets.

South Cumberland, Md.—Residents of Springvale st. are urging paving of that thoroughfare.

Holyoke, Mass.—Aldermen have vote \$89,000 loan for permanent highway work.

Whitinsville, Mass.—Macadamizing of Church st. is being considered.

Benson, Minn.—Swift County Commissioners have appropriated \$2,000 for extension of State highway.

Kearney, Neb.—Mayor J. W. Paterson has recommended need of good roads and clean, graded streets.

Atlantic City, N. J.—Council has decided to pave portions of 13 streets and nine alleys.

Reno, Nev.—Commissioners of Washoe and Ormsby counties have decided to build a road from Reno to Carson City, and hence to Lake Tahoe.

New Brunswick, N. J.—Board of Freeholders has rejected bids received for stone on the following roads: State st., Perth Amboy; St. George's ave., Perth Amboy; Woodbridge to Iselin, Menlo Park to Union County line.

Paterson, N. J.—Board of Works has passed ordinances for grading, curbing and guttering certain streets.

Perth Amboy, N. J.—Board of Aldermen has decided to pave Smith st., High to State st., with asphalt blocks; is also considering paving of three streets with bituthic.

Vincentown, N. J.—Taxpayers have decided to expend about \$4,500 in curbing and macadamizing full width of main thoroughfare.

Albany, N. Y.—Board of Contract and Supply has decided to ask for bids for improvement of three streets.

Herkimer, N. Y.—Engineer Wilbur has been instructed to prepare plans and specifications for pavement of South Washington st. between Eastern ave. and Smith st.

Ithaca, N. Y.—Tompkins County Board of Supervisors has decided to construct Freeville-Groton road, 4.49 miles, at cost of \$1,200.—E. C. Evans, Superintendent.

Little Falls, N. Y.—State Highway Commission has signified its intention of paving center of East Main st. with asphalt macadam from Gulf bridge to Alexander st.

New York, N. Y.—Board of Estimate has adopted final plans for tunneling street under Fort George Hill to connect Broadway with 191st st. station of subway.

Niagara Falls, N. Y.—City Engineer F. S. Parkhurst, Jr., has prepared bids for paving of Portage road from Buffalo ave. to Main st.; seven different kinds of paving are specified; estimated cost about \$70,000.

Kings Mountain, N. C.—Kings Mountain precinct, Cleveland County, will vote May 6 on \$25,000 bonds for road construction.

Pittsboro, N. C.—Bids will be received May 5 for \$5,000 street improvement bonds.—E. Nooe, Mayor.

Rich Square, N. C.—Rich Square Township will issue \$30,000 bonds for road improvements.—Andrew J. Conner, Chairman Road Commissioners.

Washington, N. C.—New Hanover County will vote May 31 on \$50,000 bonds for road and bridge construction.

Joliette, N. D.—Joliette Township is considering purchase of 24-wheel scrapers.—Frank Emerson, Clerk.

Akron, O.—Board of Control has rejected 11 bids for construction of city sidewalks.

Bellefontaine, O.—Council has passed resolutions for construction of seven miles of sidewalk.—L. E. Pettit, Mayor.

Cincinnati, O.—County Commissioners have ordered plans and specifications for improvement of Country Club road, from leading pike to Ohio pike, Silverton, at estimated cost of \$5,011; also adopted Surveyor Cowan's plans and specifications for improvement of Bond road, Montgomery rd to Camargo pike, at estimated cost of \$7,510, and for macadamizing of extension of Struble road, from Pippin road to Hamilton pike, at estimated cost of \$4,588.

Cincinnati, O.—Council has passed ordinance authorizing following bond issues: \$7,700 for improvement of Terrace ave., \$3,000 for Charlton st., \$8,000 for Melrose ave., \$7,500 for opening of 3d ave. and \$6,000 for paving of Hoff ave.

Millersburg, O.—Bids will be received in about a month for paving 6,000 sq. yds. of streets.

Oklahoma City, Okla.—Because contractors' bidding for contracts for \$400,000 worth of paving failed to file analysis of the material they intended using Council has rejected the bids of seven firms; specifications will be readvertised and bids asked for.

Baker, Ore.—Citizens have voted \$45,000 bonds for paving streets.

Johnstown, Pa.—Councils are considering paving resolutions amounting to \$115,985.

Marysville, Tenn.—Bids will be received May 15 by Blount County Commissioners for bond issue for pike roads.

Georgetown, Tex.—Williamson County has voted \$100,000 of bonds for road construction.

phalt Paving Co., 7th and Hooper sts., San Francisco, (a) 17c., (b) 19c.; Fairchild, Gilmore & Wilton Co., Pacific Electric Bldg., Los Angeles, (a) 15 9-10c., (b) 18 4-10c.

Fort Wayne, Ind.—Clay st., Columbia to Berry, per lin. ft., Barber Asphalt Co., \$8.93; Centra. Paving Co., Boston block, \$8.60; Moellering Construction Co., \$8.98; preliminary order for asphalt; Clay st., Berry to Washington, Barber Asphalt Co., \$8.24; Central Paving Co., \$7.70; Moellering Construction Co., \$8.29; preliminary order for asphalt entered; Clinton st., Wallace to Pontiac, Barber Asphalt Co., \$7.73; Moellering Construction Co., brick, \$7.79; Asphalt Block Co., 3-in. block \$9.13, 2½-in. block \$8.81, 2-in. block, \$8.51; preliminary order for asphalt entered; John st., Creighton ave. to Pontiac st., Barber Asphalt Co., \$7.16; Central Paving Co., brick, \$7.50; Moellering Construction Co., brick, \$7.20; Asphalt Block Co., \$8.66, \$8.34, \$8.04; preliminary order for asphalt entered; Park ave., Broadway to Thompson, Barber Asphalt Co., \$6.80; Central Paving Co., brick, \$6.77; Moellering Construction Co., brick, \$6.95; Asphalt Block Co., \$8.30, \$8.01, \$7.74; preliminary order for asphalt; Runkion ave., Main to High, Barber Asphalt Co., \$8.28; Central Paving Co., brick, \$7.80; Moellering Construction Co., brick, \$8.40; F. D. Kruse, Metropolitan block, \$8.07; preliminary order for shale brick; Schick st., Wayne to Maumee, Barber Asphalt Co., \$6.58; Central Paving Co., brick, \$6.90; Moellering Construction Co., brick, \$6.66; Asphalt Block Paving Co., \$7.90, \$7.63, \$7.28; preliminary order for asphalt; Spy Run, St. Mary's River to Elizabeth st., per sq. yd., Barber Asphalt Co., \$1.76; Central Paving Co., brick, \$1.72; Moellering Construction Co., brick, \$1.79; Asphalt Block Paving Co., \$2.44; preliminary order for shale brick; Spy Run ave., from Elizabeth st. to State st., per sq. yd., all bids same as previous contract except Central Paving Co., which bid \$1.74; Spy Run, State st. to Feeder Canal bridge, all bids same as previous contract; preliminary order for shale brick.

Lexington, Ky.—Improvements of paving on College View ave., Central Construction Co., only bidder, \$2,797.50; macadam street with asphalt binder, \$1.35 per sq. yd., with the same price for excavation; total cost with the binder, \$3,642.50.

Newark, N. J.—Granite paving: Ogden st., Jersey Paving Corp., lowest bidder, \$18,346, and Malvern st., Delancy st. and Tyler st., J. F. Shanley Co., lowest bidder, \$47,248, \$42,041 and \$34,792, respectively; brick paving: South 17th st. and 14th ave., Newark Paving Co., \$40,718 and \$22,224, respectively; Vincent st., Jersey Paving Corp., \$9,762; Bigelow st., McMahon Construction Co., \$7,961, and S. 14th st., Van Keuren & Son, \$36,930; bitulithic: Clifton ave., Madison ave., Mapes ave. and Sherman ave., Standard Bitulithic Co., \$15,039, \$30,813, \$13,500 and \$31,938, respectively.

Brooklyn, N. Y.—Regulating and paving with asphalt on concrete foundation the roadway of 52d st., from 13th to 16th aves., Barber Asphalt Paving Co., \$12,572; Brooklyn Alcatraz Asphalt Co., \$11,138; Cranford Co., \$11,175; Uvalde Contracting Co., \$11,462; regulating, grading, curbing and laying sidewalks on 8th ave., from 62d st. to Bay Ridge ave., M. J. O'Hara, \$15,821; J. J. Schneider, \$15,018; Napola Caponi, \$21,077; Seaboard Construction Co., \$19,657; Chas. J. Vofri, \$14,685; P. S. Hickey, \$12,003; McCauley & Manton Co., Inc., \$14,986; regulating and paving with asphalt on a concrete foundation roadway of Caton ave., from Cauley & Manton Co., Inc., \$14,986; regulat-Asphalt Paving Co., \$12,160; Brooklyn Alcatraz Asphalt Co., \$10,467; Uvalde Contract-

ing Co., \$12,278; Cranford Co., \$10,714; regulating, grading, curbing and laying side walks on 68th st., from 4th to Fort Hamilton ave., W. W. Gorman, \$19,885; J. Schneider, \$17,239; Charles J. Vofri, \$16,130; P. S. Hickey, \$17,566; Seaboard Construction Co., \$23,265; McCauley & Manton, \$18,867.

Mt. Vernon, N. Y.—Regulating, grading and improving of Prospect ave.: James Piro, new curb 65c., old curb 35c., brick pavement on 4-in. concrete \$2.20, brick pavement 50c., macadam \$1, new flag 70c. old flag 10c., brick pavement on 6-in. concrete \$2.35; Guarino & Covino, new curb 75c., old curb 35c., brick pavement on 4-in. concrete \$2.20; brick pavement 50c., macadam \$1, new flag 65c., old flag 9c., brick pavement on 6-in. concrete \$2.35; Frank Nordone, new curb 68c., old curb 45c., brick pavement on 4-in. concrete \$2.20, brick pavement \$1.29, macadam 95c., new flag 62c., old flag 10c., brick pavement on 6-in. concrete \$2.30; Louis Petrillo, new curb 78c., old curb 35c., brick pavement on 4-in. concrete \$2.25, brick pavement 78c., macadam 95c., new flag 63c., old flag 9c., brick pavt. on 6-in. concrete \$2.30; J. A. Siller, new curb 70c., old curb 35c., brick pavement on 4-in. concrete \$2.25, brick pavement \$1.10, macadam \$1.05, new flag 65c., old flag 8c., brick paving on 6-in. concrete \$2.4

Utica, N. Y.—Paving Mary st., 3d ave., Mohawk st., asphalt, with artificial stone curb, \$6,071.10; with natural stone curb, \$6,726.30; Knox st., West ave. to City st., asphalt, with artificial curb, \$1,731.90; with natural stone curb, \$1,918.20; Hickory st., West ave. to York st., asphalt, with artificial curb, \$9,246, with natural stone curb, \$10,212; Kirkland st., State to Sunset ave., asphalt, with artificial curb, \$10,881.10; with natural curb, \$12,034.30; Humbert ave., Mohawk st. to George pl., asphalt, with artificial curb, \$5,226.50; with natural curb, \$5,807; Young pl., Humbert ave. to South st., asphalt, with artificial curb, \$2,434.50; with natural curb, \$2,703; Fay st., Lafayette Columbia st., asphalt, with artificial curb, \$2,509.10; with natural curb, \$2,730.80; Can st., Breese to Schuyler st., asphalt, with natural stone curb, \$8,599.30.

Dayton, O.—Furnishing 10 car loads asphalt to be used in repair of streets this spring and summer: Barbour Asphalt Co. submitted low bid of \$23 per ton on Trinidad asphalt; bids of the other concern were all upon refined asphalt and were as follows: American Asphalt and Rubber Co., Chicago, \$25.81; the Union Oil Co., California, \$26.90; Warren Bros., \$28.50, and Globe Asphalt Co., Pittsburg, \$28.50.

Philadelphia, Pa.—Paving portions of streets, recently opened in various sections of the city with asphalt; streets require foundations and asphalt covering, and provide for guarantee for five years: Filby Co., \$1.65 per sq. yd.; Barber Co.'s ranged from \$1.71 to \$1.99; repairs to other than asphalt streets, bids on granite block are Filbert Co., 22c. per sq. yd.; R. Bennis, 23c.; American Paving and Construction Co., 27c.; Mack Paving and Construction Co., 32c.; Cunningham Paving and Construction Co., 25c.; vit. brick, Bennis, 28c.; American Co., 37c.; Mack Co., 42c.; Cunningham Co., 27c.; cobble rubble paving, Bennis, 25c.; American, 50c.; Filbert, 25c.; Mack, 30c.; Cunningham, 27c. per sq. yd.

Austin, Tex.—Paving (a) 45,000 sq. yd. (b) rock excavation, (c) dirt excavation Texas Bitulithic Co., (a) \$2.21, (b) \$3.35c.; Turner & McDonald, granitoid, \$1.85, (b) \$2, (c) 45c.; creosoted wood block paving, (a) \$2.45, (b) \$1.50, (c) 45c.; Tex Grading Co., wood blocks, (a) \$2.44,

Lawton, Okla.—Bids received Apr. 10 for paving: (A) C. N. Shaw & Co., city, award contract, \$156,319.39; other bidders: (B) E. K. Kerby, city, \$165,180.46; (C) C. I. De Oklahoma City, \$173,643; (D) Mayfield, Shaw & Resman, city, \$158,294.99; (E) Engineers estimate, \$179,002.17.

50, (c) 45c.; vit. brick, (a) \$2.57, (b) \$2.50, (c) 45c.; J. O. Polhemus, wood blocks, (a) \$2.46, (b) \$2, (c) 40c.; vit. brick, (a) \$1.15, (b) \$2, (c) 40c.; Knox T. Johnson, wood blocks, (a) \$2.20, (b) \$1.50, (c) 50c.; vit. brick, (a) \$1.05, (b) \$1.50, (c) 50c.; concrete, (a) \$1.75, (b) \$1.50, (c) 50c.—John O. Johnson, City Clerk.

Portsmouth, Va.—Construction of the county's portion of proposed new macadam pavers through Lafayette Residence Park, James Creek District, from limits of City of Norfolk to Cottage Toll Bridge road; Parke Lindsay, Portsmouth, lowest bidder, 74 1/2c. per sq. yd.; road is about three-quarters of a mile in length; Ft. P. Denby, Norfolk, bid 81c. per sq. yd., and Dalby, Nottingham & Co., Portsmouth, 77c. per sq. yd.

Platteville, Wis.—Constructing 8,880 sq. ds. of paving; Thomas W. Quinn, \$1.82 per sq. yd. for brick, total bid \$19,030; Thomas E. Woolley, reinforced concrete, 1.39 per sq. yd., total \$14,354; asphalt macadam, \$1.82 per sq. yd., total \$18,153; sarcotithic \$1.82 per sq. yd., total \$18,153.

SEWERAGE

Fayette, Ala.—City is considering construction of sewer system.

Oxford, Ala.—Citizens will vote April 22 on \$12,000 bonds for sewerage system.

Bakersfield, Cal.—City Engineer C. Greey has prepared plans for construction of public sewer in District No. 15, estimated to cost \$27,500; also plans for similar sewer in District No. 16, cost \$27,500.

Santa Barbara, Cal.—Council has ordered construction of vit. pipe sewer in Carrillo and Anacapa sts.

New Britain, Conn.—Council is considering \$40,000 bond issue for proposed sewer work.

Arcadia, Fla.—Citizens will vote May 16 on \$20,000 bonds for construction of sewer system.

Jasper, Fla.—Citizens will vote on \$10,000 bonds for construction of sewer system.

Fort Valley, Ga.—Citizens will vote April 9 on \$35,000 bonds to lay sewerage system and make other improvements.

New Iberia, La.—Establishment of sewer system is being considered.

Holyoke, Mass.—Board of Aldermen has voted \$13,000 loan for permanent sewer work.

Quincy, Mass.—City has sold \$30,000 sewer bonds to Parkinson & Burr.

St. Paul, Minn.—Board of Public Works has rejected all bids for Dearborn st. sewer.

Kearney, Neb.—Mayor J. W. Paterson has recommended formation of sewer district.

Garwood, N. J.—Council is considering ordinances for extension of sewer system.

Haledon, N. J.—H. J. Harder, Paterson, is completing plans for sewers and sewage disposal plant; cost about \$40,000.

Monmouth Beach, N. J.—Borough Council has decided to construct sewer system.

J. P. Manahan, Mayor.

Paterson, N. J.—Board of Works has passed ordinance for constructing number of lateral sewers in various sections of city.

Plainfield, N. J.—State Board of Health has decided against North Plainfield's plans for sewage disposal plant which called for location of sewage beds in North Plainfield Township.

Syracuse, N. Y.—Council is considering installation of system of sewers for Huntley tract and parts of Third and Fourth wards.

Marion, O.—Council has passed ordinance for constructing sanitary sewer and cellar drain: 1,300 lin. ft. of 6-in. and 8-in. vit. pipe and five manholes needed.—Pearl R. Sears, City Engineer.

Tiffin, O.—Council has ordered City Engineer to prepare plans for sewers on 2d, 1st, Washington and Grand aves.

Drain, Ore.—Citizens have voted \$5,000 bonds for sewers.

Portland, Ore.—Council has adopted resolution authorizing the City Engineer to prepare and file plans for proposed Columbia trunk sewer to drain Woodlawn, Vernon and other thickly settled districts.

Chester, Pa.—Installation of sewers and disposal plant is being urged.

Masontown, Pa.—Chester & Fleming, Union Bank Bldg., Pittsburg, are preparing plans in connection with City Engineer E. C. Baker for sewage disposal plant.

York, Pa.—Bids will be asked by Highway Committee of Council for storm water sewers on Vine st. and extension of Jackson st. sewer.

Aberdeen, S. D.—Citizens have voted \$200,000 bonds for sewerage extension purposes.

Madison, S. D.—Citizens have voted \$65,000 sewerage bonds.

Newport, Tenn.—Citizens will vote April 29 on \$50,000 bonds to build system of sewerage and water works.

Groveton, Tex.—Trinity County is considering election on \$150,000 road bonds.

Longview, Tex.—Citizens have voted \$90,000 bonds for paving streets and purchasing sewer system.

Tazewell, Va.—Tazewell County has voted \$625,000 bonds for good roads.

Seattle, Wash.—Board of Public Works has approved plans for sewerage Meridian ave.

Seattle, Wash.—Board of Public Works has adopted plans for sewerage East 71st st.

South Bend, Wash.—Contract will be let in about 30 days for pipe and concrete trunk sewers; cost about \$20,000.—Chas. H. Mills, City Clerk.

CONTRACTS AWARDED

Attalla, Ala.—To J. L. O'Conner, Knoxville, Tenn., to construct sewers costing about \$30,000; Wilburn Hill, of Hazlehurst & Gadsden, Atlanta, Ga., will supervise work.

Los Angeles, Cal.—To S. M. Kerns for constructing vit. pipe sewer on Wilshire Blvd., \$5,375, and to Peter Grbovach for storm sewer in Humboldt and other streets, \$15,500.

Freeport, Ill.—Building sewers: West Freeport sewer, to J. W. Turner, of Des Moines, Ia., \$29,979, or \$777.56 below the estimate; East Freeport, to Frank Komanski, Watertown, Wis., \$14,967, or \$1103 above the estimate.

Indianapolis, Ind.—To the American Construction Co. for sewer in Jackson pl., about \$70,000.

Fort Leavenworth, Kan.—Sewer improvements at the fort, to A. J. Taussig Construction Co., St. Louis, \$48,928.40; other bidders: McGuire & Stanton, \$52,523.18; E. W. Geiger, city, \$53,045; Boyd Construction Co., Kansas City, Kan., \$52,000; John Barnes, Leavenworth, \$56,987.

Hutchinson, Kan.—Building lateral sewer in District 38, to O. F. Davis.

Boston, Mass.—Building sewer in Morrison st., to Antony Cefalo, \$1,490.01; other bidders: West Roxbury Trap Rock Co., \$1,714.45; Murphy & Dolan, \$2,069.49; McCarthy & Walsh, \$2,288.05; Raffeale Cartullo, \$2,314.75; R. J. Young & Co., \$3,913.20.

Northampton, Mass.—Furnishing sewer pipe to the city for the coming year, to W. H. Riley & Co., Boston, at \$1.50 per cent. of list price.

Albert Lea, Minn.—To J. J. Connolly, St. Paul, for construction of sewer, \$3,143; other bidders: Lars Overn, St. Peter, \$5,250; Frazier & Danforth, Rochester, \$4,250; Greene Bros., city, \$4,315.48; Pastoret, Lawrence Co., Duluth, \$4,522.18; Illstrup & Olson, Minneapolis, \$3,910; Roberts & Few, Brookings, S. D., \$4,581; detail bid of lowest bidder is as follows: 100 ft. 8-in. vit. pipe, 6 to 8 ft. trench, 70c.; 1,124.24 ft. 8 to 10 ft. trench, 80c.; 1,048 ft. 10 to 12 ft. trench, 88c.; 340 ft. 12 to 14 ft., \$1.05; 698.12 ft. 14 to 16 ft., \$1.15, and 155.88 ft., 16 to 18 ft., \$1.45.—Wm. Barneck, City Engineer.

Brainerd, Minn.—Building sewers in northeast part of city and on Laurel st., to Pastoret-Lawrence Co., Duluth.

South Orange, N. J.—Construction of sewers for Hilton District, to J. J. Fusco, Montclair, \$18,246; other bidders: Antonio Costa, Orange, \$20,734; H. Spinach Construction Co., Waterbury, Conn., \$21,511; Martin & Miller, Roselle Park, \$22,471; Chas. Ippolito, Orange, \$23,287; Pas. Cestone, Montclair, \$23,803; J. F. Callahan, Elizabeth, \$25,407; John Dorer, Irvington, N. Y., \$28,108; Mason Hilton & Co., New York, N. Y., \$31,951; Pas. Mauriello, Orange, \$32,984.

Gastonia, N. C.—To P. R. Huffsietler and H. F. Oakley, city, to build sewer in Western part of city, \$4,090.

Niles, O.—Building sewers in Sewer District No. 6, to Frank Mannella, 6941 Chaucer st., East End, Pittsburg, Pa., 18,551 cu. yds. earth excavation, 55c.; 188 cu. yds. brick masonry, \$10; 2 3-10 tons of iron pipe \$50; 750 lin. ft. 15-in. pipe, double strength, 42c.; 710 lin. ft. 15-in. pipe, 37c.; 384 lin. ft. 12-in. 25c.; 1,300 lin. ft. 10-in., 20c.; 11,750 lin. ft. 8-in., 14c.; 6,353 lin. ft. 6-in., 10c.; 1,500 lin. ft. 4-in. 70c.; total \$15,496.89; other bidders: Kimbrough & Elder, New Castle, Pa., \$19,063.17; Burns Bros., New Castle, Pa., \$16,224.98; C. L. Allen, Marion, \$17,909.90; Jas. McCracken & E. W. Masters, Warren, \$20,395.98; V. Mango & G. A. Giardini, city, \$19,302.09.

Chambersburg, Pa.—Building complete sewer system in town, about 16 miles of it to James Ferry & Son, Pittsburg, \$160,154.43; to Cantrell Construction Co., Philadelphia, trunk line from disposal plant to Wolf ave., \$22,953.85; disposal plant, to Pitt Construction Co., Pittsburg, \$58,170.70.

York, Pa.—Building storm water sewer on South Richland ave., to General Supply and Construction Co., \$3,606.20.

Seattle, Wash.—Laying sewers on Woodlawn ave., to Wm. Kopta, 1422 27th ave., \$16,997.

Appleton, Wis.—Building sewer on three streets, to J. H. Wait, \$2,885.

BIDS RECEIVED

Easton, Md.—Eleven bids for building proposed sewerage system were opened April 15; lowest was that of Hines & Hayman, Baltimore, \$37,601.78, and the highest, William C. Evans, Ambler, Pa., \$51,867.17.

Mt. Vernon, N. Y.—Construction of the lateral sewer on Cedar st.: J. A. Sillery, \$1,700; James Charci, \$2,325; Frank Nordone, \$1,625; Sabino Guarino, \$1,540; Tony Longo, \$2,400; Louis Petrillo, \$1,425; Sidney ave. sewer: Louis Petrillo, \$488; J. A. Sillery, \$275; Tony Longo, \$400; James Charci, \$110; Frank Nordone, \$445; Sabino Guarino, \$375.

Grandview Heights, O.—Construction of sewer system from plans of E. G. Bradbury, Columbus; John C. Beasley, Columbus, lowest bidder, as follows: 18,045 cu. yd. earth excav. in trench, 50c; 18,045 cu. yd. rock excav. in trench, \$2.50; 173 cu. yd. brick masonry, \$9; 42 cu. yd. concrete masonry, \$10; laying 24,462 lin. ft. sewer pipe, 6c.; 81 c-i. manhole tops, each, \$9; 400 manhole steps, each, 30c.; M ft. sheeting left in, \$16; sewer pipe, 81 per cent discount, \$19,329; 336 Y poles, each 5c., 17 tons c-i. pipe, laid, \$40; 15 flushing gates, each \$1, 56 manhole pans, each \$2; excav. (lump sum), river, \$850; total, \$18,708. Totals of other bids: Jas. Westwater Co., Columbus, \$23,253, and C. T. McCracken & Co., Columbus, \$19,508.

Niles, O.—Construction of the south side sewers; specifications, earth excavation, 18,551 cu. yds.; brick masonry, 188 cu. yds.; iron pipe 2 3-10 tons, 15-in. pipe, double strength, 700 lin. ft.; 15-in. pipe, 710 lin. ft.; 12-in. pipe, 384 lin. ft.; 8-in. pipe, 11,756 lin. ft.; 6-in. pipe, 6,353 lin. ft.; 4-in. pipe, 1,500 lin. ft.; Kimbrough & Elder, New Castle, Pa., excavation 73c. per yd., brick masonry \$11 per yd., iron pipe \$45 per ton, 15-in. d.s. pipe 31c. per lin. ft., 15-in. pipe 25c. per lin. ft., 12-in. pipe 21c., per lin. ft., 8-in. 14c. per lin. ft., 6-in. 12c., 4-in. 15c., total \$19,063.17; Frank Manella, Pittsburg, excavation 55c. per yd., brick masonry \$10 per yd., iron pipe \$50 per ton, 15-in. pipe, d. s. 42c. per lin. ft., 8-in. pipe 20c. per lin. ft., 6-in. 14c. per lin. ft., 4-in. 7c. per lin. ft., total \$15,496.89; Burns Bros., New Castle, excavation 54c. per cu. yd., brick masonry \$13 per cu. yd., iron pipe \$45 per ton, 15-in. d. s. pipe 35c. per ft., 15-in. pipe 27c. per ft., 12-in. 22c., 8-in. 19c., 6-in. 12c., 4-in. 6c. per ft., total \$16,324.98; C. L. Allen, Marion, O., excavation 64c. per yd., brick masonry \$10 per cu. yd., iron pipe \$50 per ton, 15-in. d. s. pipe, 45c. per ft., 15-in. pipe 38c. per ft., 12-in. pipe 28c., 8-in. pipe 17c., 6-in. pipe 14c., 4-in. pipe 10c., total \$17,909.90; James McCracken and E. W. Masters, Warren, excavation 75c. per cu. yd., brick masonry \$10 per cu. yd., iron pipe \$38 per ton, 15-in. d. s. 40c. per ft., 15-in. 36c., 12-in. 28c., 8-in. 22c., 6-in. 13c., 4-in. 9c. per ft., total, \$20,395.98; V. Mango and G. A. Giardini, Niles, excavation 71c. per cu. yd., brick masonry \$9.50 per cu. yd., iron pipe \$37 per ton, 15-in. d. s. pipe 50c. per ft., 15-in. pipe 44c. per ft., 12-in. pipe 32c. per ft., 8-in. 18c., 6-in. 14c., 4-in. 7c. per ft., total \$19,302.09.

Moose Jaw, Sask., Can.—Pumps, sewer and water extension, sewerage disposal plant, etc.: Sewage disposal works, Manders Bros., Edmonton, \$124,023; Geo. H. Archibald & Co., Winnipeg, \$129,500; Flanigan & Murphy, \$134,585; Navin Bros., Moose Jaw, \$143,713; Moose Jaw Construction Co., \$143,641; City Engineer, \$146,306; Simple Concrete Piling and Construction Co., \$139,000; sewage pumps, Canada Foundry Co., Toronto, \$1,960; John Macdonnell Iron Works, Montreal, \$2,281; the Canada Land Co., Ltd., Montreal, No. 1, \$1,615.24; the Canada Land Co. Ltd., Montreal, No. 2, \$1,249.74; Canada Ford Co., Montreal, \$4,825; supplying c-i. pipe, Stanley Brock, Ltd., Winnipeg, (a) 6-in., \$39.25, (b) 4-in., \$39.25; Thompson Pipe Foundry (a) \$40, (b) \$40; Francis Hankia & Co., Montreal, (a) \$41.40, (b) \$41.95; H. A. Drury & Co., Ltd., Montreal, (a) \$43, (b) \$44.05; Moose Jaw Machine Works (a) \$45.77, (b) \$47.31; Whitlock & Marlatt, (a) \$45.50, (b) \$45.50; Chas. Miller & Co., (a) \$45.60, (b) \$45.60; S. D. Wood & Co., (a) \$18.25, (b) \$21; R. Cunningham (a) \$50.47, (b) \$50.47; Canada Foundry Co., (a) \$42.50, (b) \$42.50; Bissett & Loucks, (a) \$15, (b) \$15.60; sewer and water extensions, Navin Bros., Moose Jaw, \$51,113; L. W. Scruth, Fargo, N. D., \$56,519; C. J. Robinson, Moose Jaw, \$52,774; H. G. McVean, Moose Jaw, \$54,740; Flanigan & Murphy, Moose Jaw, \$58,800; Ransom & Kilkenny, Moose Jaw, \$63,000; C. J. Townsend, Toronto, \$60,000; Audies Bros., Edmonton, \$66,917.75; City Eng., \$55,713; sewer pipe, Dominion Sewer Pipe Co., \$12,937.70; Saskatchewan Glass and Supply Co., \$13,832.12; Whitlock & Marlatt, \$13,531.18; Macomb Sewer Pipe Co., \$14,597.24; Hamilton and Toronto Sewer Pipe Co., unit prices: D. F. Lee, \$13,592.17; R. Cunningham, \$14,890.28.

WATER SUPPLY

Aliceville, Ala.—City will grant franchise to City Water Co. for construction of water works; cost \$10,000; A. S. Murphy can be addressed.—J. B. Cunningham, Mayor.

Mena, Ark.—City will improve water works at cost of about \$60,000.—John Thompson, Chairman Board of improvements.

Lindsay, Cal.—Haviland & Tibbetts, Alaska Commercial Bldg., San Francisco, have been selected to prepare plans for water works and sewers.

Ontario, Cal.—Erection of three reservoirs for the city's water system, to Simmons & Hayden, for the cement work, and to Oscar Coih for roofing of reservoirs; combined bid, \$20,074.92.

San Diego, Cal.—Water Department will install about 15 miles of new mains; c.-i. pipe will be used, from 36-in. down.—H. R. Fay, Superintendent.

Fort Lupton, Col.—Citizens have voted \$25,000 bonds to construct water system.

Norwood, Col.—Citizens have voted \$12,000 bonds to install water works.

Olathe, Col.—Citizens have voted \$50,000 bonds to install water system.

Arcadia, Fla.—Citizens will vote May 16 on \$20,000 bonds for construction of water works.

Fort Valley, Ga.—Citizens will vote April 29 on \$35,000 bonds to complete water works and make other improvements.

Preston, Ida.—Citizens have voted bonds for installation of water works.

Moline, Ill.—Plans for \$30,000 filtration plant to supply arsenal with its supply of water are now being drawn by Captain H. B. Jordan and bids will be advertised for as soon as specifications are completed.

Peru, Ind.—A. T. Maltby, Consulting Engineer, Great Northern Bldg., Chicago, Ill., will take charge of providing a new and increased water supply and rebuild water works plant.

Glen Rock, Ia.—Citizens will vote on \$8,000 bonds to increase water supply.

Gilmore City, Ia.—Citizens have voted bonds for water works; cost about \$12,000; engineer not yet selected.—H. C. Mormon, Town Clerk.

Elk City, Kan.—City will soon receive bids for installation of water works; L. Y. McFarland has prepared plans; cost about \$25,000.

Emporia, Kan.—City is considering changing pumping from steam to electricity; will need about 2½ miles of transmission line, two 3,000,000-gal. pumps, also booster pump; bids will be asked early in May.—Matthew Brown, City Engineer; F. H. Smith, City Clerk.

Leavenworth, Kan.—Auxiliary water main from pumping station on the reservation to system of water mains in city is to be installed by Leavenworth City and Fort Leavenworth Water Co.; main will be 18-in. iron pipe.

Waterville, Kan.—Citizens have voted \$30,000 bonds for installation of water works and an electric light plant.

Madisonville, Ky.—Articles of incorporation have been filed by the City Water Co.; capital stock \$50,000; company will install water works system.

Baltimore, Md.—Baltimore County Water and Electric Co. will issue \$111,000 of bonds for extension to water mains.—J. G. MacDonald, 100 W. Fayette st., Secretary.

Frostburg, Md.—Council will take up matter of larger water supply.

Athol, Mass.—City will expend about \$20,000 to \$30,000 on water works.—Jas. L. Tighe, Holyoke, Engineer; H. L. Heapgood, Chairman Water Works Commission.

Marquette, Mich.—Citizens will vote May 5 on \$75,000 bonds for extension of intake pipe of water works.

Eveleth, Minn.—Council will advertise for bids for 2,500,000-gal. crank and flywheel shape pump.

North Mankato, Minn.—John Wilson, Mankato, has been selected to prepare plans for water works; cost about \$20,000.

Shakopee, Minn.—Citizens have voted \$10,000 bonds for water works improvements.

Tylertown, Miss.—Citizens have decided for private ownership of water and electric light plant; Board will let franchise to best bidder.

Cole Camp, Mo.—Citizens have voted \$10,000 bonds for water works.—E. Schwarz, Mayor.

Bridgeton, N. J.—Council has decided that city utilize water from Tumbling Dam Park lakes and streams as approved by State Board of Health for city water supply; also passed ordinance providing for issuing of \$75,000 bonds for installation of the new system, pumping station and filtration plant.

Stanhope, N. J.—Council has decided to build municipal water plant.

Trenton, N. J.—E. C. Hutchinson Water Co. has been organized to supply water to

residents of Hamilton Township.—E. C. Hutchinson, 1214 Hutchinson and S. T. Atchley, Incorporators.

New York, N. Y.—Water Commissioner Thompson is urging \$2,500,000 appropriation for installation of filtration plant.

Massillon, O.—Citizens will vote in November on \$150,000 bonds to build water works plant.

Braggs, Okla.—Plans are being prepared by Winters & Dove, 810 First National Bank Bldg., Fort Smith, Ark., for installation of water works.

Conveta, Okla.—City will extend water works system, including two miles of pipe line, auxiliary pumping plant and other improvements.—Winters & Dove, 810 First National Bank Bldg., Fort Smith, Ark., Engineers.

Kingfisher, Okla.—Citizens have voted \$28,000 bonds for water works extension and for changing electric system from a single-phase to 3-phase system; the electric plant will also be enlarged.—V. H. Francis, Superintendent.

Waynoka, Okla.—Wm. Haviland, Alva, is preparing plans for water works and electric light plant.—C. D. Willard, Town Clerk.

Baker, Ore.—Citizens have voted \$25,000 bonds for installation of 3,000,000-gal. reservoir and \$90,000 for replacement of wooden flume from Salmon Creek to settling tank; bids will soon be asked for work.

Drain, Ore.—Citizens have voted \$15,000 bonds for water works.

Springfield, Ore.—Council is considering construction of reservoir on Willamette Heights.

Blairsville, Pa.—Engineer O'Brien, Latrobe, is preparing plans for reservoir.

Bristol, Pa.—Council has rejected all bids received for furnishing materials and constructing complete water works, system and filtration plant.

Catasauqua, Pa.—Town is considering construction of municipal water works system.

Oil City, Pa.—Water Commission has recommended that city expend \$18,000 in improving pumping station.

Womelsdorf, Pa.—Womelsdorf Consolidated Water Co. will construct reservoir at foot of South Mountain, with a capacity of over 3,000,000 gals.

Dyersburg, Tenn.—Citizens will vote May 9 on \$30,000 water and light bond.

Manchester, Tenn.—Citizens have voted \$25,000 water works and electric light bonds.

Newport, Tenn.—Citizens will vote April 29 on \$50,000 bonds to build system of water works and sewerage.

Obion, Tenn.—City is considering election on \$25,000 bonds for construction of water works.

Terrell, Tex.—City Commission is considering bond issue for drilling artesian well.

Lehi, Utah.—Citizens have voted \$20,000 bonds to complete water system.

Seattle, Wash.—Board of Public Works has approved plans for water mains on North 50th st. and 12th ave. N. W.

Seattle, Wash.—Board of Public Works has adopted plans for laying water mains on 25th ave. North.

New Lisbon, Wis.—Langstead & Myers, Appleton, are preparing plans for water works and electric light plant; cost \$20,000.

Superior, Wis.—Council now has on hand proposition looking toward construction of water works plant by the city unless some favorable proposition is obtained on purchase of the plant of Superior Water, Light and Power Co.

Vancouver, B. C., Can.—City Engineer Burwell has estimated cost of installing water mains at Fort Grey at \$10,500.

CONTRACTS AWARDED

Atlanta, Ga.—Fire hydrants, to Columbian Iron Works, of Chattanooga, Tenn.; filter house on Hemphill ave., to Geo. A. Clayton, \$5,810.

Chicago, Ill.—To the Jas. A. Brady Foundry Co., 25th st. and Ashland ave., for furnishing and delivering to various pipe yards 200 tons of special castings, 4-in. to 12-in. diameter, and others, not to exceed 48-in.; furnishing water department 250 tons of valves from 4-in. to 24-in. and 2½ and 4-in. double flue hydrants; furnishing and delivering valve basins and five cistern covers to the various pipe yards of water department, to T. A. Cummings Foundry Co., 1338 Clybourne pl.

Lewiston, Ill.—Improving water works, consisting of furnishing and laying c.-i. pipe, furnishing and setting hydrants and valves, installing new pumping engine and constructing large shallow well from plans of Fuller-Coult Co., Chemical Bldg., St. Louis, Mo., to the Cook Construction Co., Des Moines, Ia., \$6,801.

Lewiston, Ill.—Constructing the water works system, to the Cook Construction Co., Des Moines, Ia., \$6,801.

Boston, Mass.—To Charles M. Callahan for laying water pipes in May st. and Geneva ave., Dorchester, and Old Colony av. South Boston, \$1,096.05; other bidders: Michael Russo, \$1,967.25; William J. Rafferty & Co., \$1,478.75; Daniel E. Lynch, \$712.50; R. J. Young & Co., \$2,057.50; Hu McNulty, \$1,490.05; Charles J. Jacobs Co., \$1,570; John A. Costello & Co., \$1,411.10; Louis Balboni, \$1,384.50; Antony Cefalo, \$632.50; Michael DeSisto & Co., \$1,308.20; Murphy & Dolan, \$1,436; Rafelle Cartul, \$1,422.25; Engineer's estimate, \$1,535.50. Laying water pipes in Electric ave. at Garden st., Brighton; Ardale, Guernsey at South Fairview sts., West Roxbury; Greenwood and Normandy sts., Rosemont rd. N. W. and Wales st., Dorchester, to same company, \$1,061.90; other bidders: Michael DeSisto & Co., \$1,204.15; Murphy & Dolan, \$1,335; Antony Cefalo, \$1,385.90; Thomas Burke, \$1,194.50; R. P. Cushing, \$1,881.10; John A. Costello & Co., \$1,319.90; Charles J. Jacobs Co., \$1,636.90; William J. Rafferty & Co., \$1,513.75; Michael Russo, \$1,939; Engineer's estimate, \$1,502.50.

Boston, Mass.—Furnishing 500 Post hydrant boxes, 100 Lowry hydrant boxes, 7 gate boxes, 600 meter boxes and 50 blow-off boxes, to White & Kennelly, at \$4 each for all kinds; other bidders: J. H. Ferguson, \$4.65; Peter W. Hill, \$4.80; D. Biggs & Co., \$4.99; Jacobs & Eager, \$5.00; J. C. Coleman & Sons, \$5.37; Chas. M. Cahalan, \$5.40; W. L. Waples Co., \$6.30, \$6.36, \$6.70, \$6.25 and \$7.25; Simpson Bros. Corporation, \$7.48; 750,000 lbs. of No. 1 castings and 200,000 lbs. of No. 2 castings, to the Davis & Farnum Mfg. Co. for No. 2, 2.63c. and 2.2c., respectively; other bidders: Mechanics Iron Foundry Co. for No. 1, No. 1, Davis & Farnum Mfg. Co., 2.33c. for No. 2; Trenton Foundry and Mach. Co., 2.47c. and 2.19c., respectively; Foxboro Foundry Co., 2.69c. and 2.24c.; Lunsden Van Stone Co., 3c. and 2.5c.

Uxbridge, Mass.—Water pipe, hydrant and other material used in the proposed extensions of water mains, to Standish Cast Iron and Foundry Co., for pipe, 8-1/2" \$22.70 f. o. b. Uxbridge; to Kennedy Valve Mfg. Co., for six 8-in. and 10 1/2-in. valves, \$165; for 14 Walker hydrants, to Norwood Engineering Co., \$22 each; hydrant, to Eastern Metal and Refining Co., for lead to be used, \$4.62 1/2 per cwt.

Holland, Mich.—To Platt Iron Works two 1,100-gal. per minute centrifugal pumps, connected to 2,200-volt motors; total \$2,158.

Troy, Mo.—Building water system, to Jager, Bold Hill, Mo., \$10,500.

Eastwood, N. Y.—Erection of standpipe 80 ft. high and 42 1/2 ft. in diameter which will hold about 100,000 gals. of water, Leonard J. Darrow, Eastwood, by Syracuse and Suburban Water Co.; standpipe will be placed at the junction of Blust st. and J. ave.

Geneva, N. Y.—By Board of Public Works, to the Snow Steam Pump Co., Buffalo, N. Y., for furnishing pump to Water Department, about \$14,000.

Cincinnati, O.—Furnishing fire plugs 1 year, to Bourbon Brass and Copper Works.

Ada, Okla.—Furnishing materials for water works extension, to A. Wyckoff Son, Alexandria, La., \$248.87 per 100 for 4,000 ft. of 30-in. wood pipe; to same \$4c. per ft. for 33,000 ft. of 12-in. wood pipe; to National Tube Co., St. Louis, Mo., 99 1/2c. per ft. for 33,000 ft. of steel pipe.

Builders' Material and Supply Co., Kansas City, Mo., \$4,548 for pumping machinery.

Yale, Okla.—Installing water works, W. C. Swanwick Co., Joplin, Mo., about \$25,000.

Lebanon, Pa.—Furnishing pumping engine for Hammer Creek plant, to Snow Co., Buffalo, N. Y., \$14,070, foundation included, or \$12,500 without foundation; other bidders: Platt Works Co., Philadelphia, \$14,140 with foundation, \$13,518 without foundation; Allis Chalmers Co., Milwaukee, Wis., \$16,600, foundation included, and \$13,100 without foundation.

Seattle, Wash.—Laying water mains on Cheilan ave., to Ferguson-Coit Co., Arcata, Annex, \$11,605.

Spokane, Wash.—Furnishing 100 valves for water department, to Crane & Co., \$10,267.00.

BIDS RECEIVED

Long Island City, L. I., N. Y.—Furnishing, delivering and erecting pumping station near the existing driven well plant at Whitestone; Paul J. Exher, 55 East 20th st., New York, \$21,850; Masonry Construction Co., \$22,889; Concord Construction Co., \$25,547; McHarg-Barton Co., \$27,877; Mitchell Construction Co., \$22,200; Kelly & Kelly, Inc., \$25,541; L. J. Wadsworth Construction Co., \$23,477; Delaney Roberts Co., \$29,413; John T. Woodruff & Son, \$25,241; J. N. Knopp, \$35,874; Thomas McKeown Inc., \$27,737.

LIGHTING AND POWER

Auburn, Cal.—Board of Supervisors has granted franchise to Great Western Power to construct pole line along Rocklinson road and other roads in county, for distribution of electricity for light and power.

Longmont, Col.—Citizens have voted \$46,000 bonds for the construction of municipal electric light plant.

Washington, D. C.—American Consul has reported that certain city in his district is planning to erect plant for manufacture of gas for lighting, heating and cooking; plans to produce at least 100,000 cubic feet of gas per day and cost about \$1,000,000. Address No. 6556, Bureau of Manufacturers.

Bridgeville, Del.—South Delaware Gas Co. has been granted franchise to extend lines to this city.

Miami, Fla.—Miami Gas Co. is preparing to spend \$60,000 on enlargement of plant.—M. Van Court, Central Trust and Savings Co., Philadelphia, Pa., President.

Cartersville, Ga.—Blue Ridge Power Co. considering construction of 150-ft. dam to develop 30,000 h. p. for transmission by electricity. Wm. A. Carlisle, Gainesville, interested.

Swainsboro, Ga.—Citizens have voted 10,000 bonds to install electric lights and water works.

Roland, Ia.—Citizens have voted \$8,000 bonds for installation of electric light plant.

Watterville, Kan.—Citizens have voted 10,000 bonds for installation of electric light plant and water works.

Lancaster, Ky.—Electric light plant has been destroyed by fire; loss \$10,000; plant will be rebuilt at once.

Shreveport, La.—City is considering construction of electric light plant.

Crystal Falls, Minn.—City is planning to improve electric light plant.

Katonah, N. Y.—Public Service Commission has authorized Katonah Lighting Co. to spend \$45,000 for extensions and improvements to plant; lighting service will be extended to town of Lewisboro.

Syracuse, N. Y.—Syracuse Lighting Co. has asked Public Service Commission for permission to issue \$470,000 bonds to improve plant and lay about 33,000 ft. of gas pipe.

Jamestown, N. D.—Installation of addition to the White Way for the business streets is being considered.

Velva, N. D.—Town Council has granted franchise for lighting streets and business and private houses to John I. Moore.

Barberton, O.—Council has passed ordinance granting Barberton Light and Power Co. right and privilege to occupy and construct poles on certain defined districts and streets.

Sentinel, Okla.—Citizens have voted \$12,000 bonds for electric light plant and \$3,000 for water works extensions; bids for bonds will be received until April 28.—F. Church, Clinton, Engineer; J. M. Terry, Town Clerk.

Baker, Ore.—Citizens have voted \$25,000 bonds for installation of electric light plant.

Elgin, Ore.—McCully-Rumble Power Co. has secured site for electric power plant on the Wallowa River; company will supply light and power to local towns. About 1,000 h. p. will be developed.—J. R. Thompson, Portland, Engineer.

Newport, Ore.—Henry Hewitt and Seymour H. Bell have purchased franchise and power plant owned by Newport Power Co. and will make improvements.

Pittsburg, Pa.—Contemplating expenditure of about \$3,000,000 for construction of an immense dam on Clarion River in Clarion County, application will be made for a charter for the Clarion River Power Co.; nine separate charters will be asked for as many townships.—Joseph R. Paul, H. W. Douglass and J. P. Fife, all of Pittsburg, Incorporators.

Royersford, Pa.—Borough is considering expending \$25,000 on proposed municipal electric light plant.—Fred W. Keeley, Burdett.

Chesterfield, S. C.—Chesterfield Light and Power Co. will receive bids at once for construction and installation of machinery for electric light plant. W. D. Craig can be addressed.

Dyersburg, Tenn.—Citizens will vote May on \$30,000 light and water bonds.

Manchester, Tenn.—Citizens have voted 25,000 electric light and water works bonds.

Alice, Tex.—Council has granted franchise to T. H. Stevens to construct electric light and power plant.

Alto, Tex.—L. S. Atkins, Center, will erect electric light and power plant; plans approved.

Galveston, Tex.—Authority has been granted to advertise for bids for installation of two new centrifugal pumps to be used in connection with steam turbines now in use in electric light department; total cost, \$3,000.

Fort Stockton, Tex.—W. F. Zarbach and Chas. A. Shroff, Cleveland, O., have been granted 10-year franchise to operate electric light and ice plant; franchise calls for work to commence immediately on \$20,000 plant.

Kerbyville, Tex.—Fleming-Morton Co. will at once install electric light plant.

Port Orchard, Wash.—Bids will probably be received by the State Board of Control, Olympia, about May 20, for construction of power plant from plans of Bullard & Hill, Tacoma; cost about \$35,000.

Wheeling, W. Va.—Board of Control will secure bids on work of remodeling gas plant for the manufacture of water gas, as planned by Consulting Engineer Baehr.

Mosinee, Wis.—Mosinee Electric Light and Power Co. has been incorporated by Arden Paronto, J. P. Kanter and others, capital \$6,000, to install plant.

CONTRACTS AWARDED

Auburn, N. Y.—Extension of five years from Oct. 1, 1911, for lighting city streets has been granted to Auburn Light, Heat and Power Co.; also contract for 10 years for ornamental lights in business section.

Riverhead, L. I., N. Y.—By Riverhead Electric Light Co., to Overton & Tutill, local electricians, to install street lighting system.

Coleman, Tex.—To the Briggs-Weaver Machinery Co., of Dallas, for construction of electric light station.

Colorado, Tex.—Council has closed a contract with the Colorado Electric Light Co. to light up all street crossings in the city; extra large lights are to be used in the business district and 25-watt tungsten lamps in the residence parts; contract is for two years and the rate \$75 per month.

Spokane, Wash.—To J. A. Roebling Sons Co., Trenton, N. J., 100 miles of No. 10 copper-clad steel wire, \$3,335; four miles No. 10 copper wire, \$150; 5,000 ft. of No. 12 duplex solid copper wire, \$107; to Washington Electric Co., 500 two-piece insulators, \$56.58.

FIRE EQUIPMENT

Pelham, Ga.—Citizens have voted \$6,000 for fire station.

Danbury, Conn.—Erection of fire house is being considered.

Freeport, Ill.—Mayor C. J. Dittmar has recommended modern equipment for fire department, including aerial truck.

Indianapolis, Ind.—Council has passed ordinance authorizing \$200,000 bond issue for improving fire department.

Marion, Ind.—Fire Chief Crearer has recommended enlargement and improvement of fire alarm system.

Waterloo, Ind.—Fire Chief Mungovan is urging need of new fire apparatus.

Covington, La.—Chemical Co., No. 1 is considering purchase of auto hose cart.

Baltimore, Md.—Architect Robert C. Ulrich is preparing plans for erection of \$25,000 engine house at Fulton ave. and Baker st.

Fitchburg, Mass.—Town is considering erection of fire station.

Holyoke, Mass.—Board of Aldermen has voted \$10,000 loan for five auto trucks.

Englewood, N. J.—Council has empowered Fire Committee to obtain estimates and costs on modern fire apparatus.

Paterson, N. J.—Proposed West Paterson fire house will be erected at New Grand and West 12th sts.

Albany, N. Y.—Board of Contract and Supply has directed Architect A. W. Fuller to prepare plans and specifications for additions and alterations to Steamer No. 6.

New York, N. Y.—Board of Estimate has approved plans and specifications for erection of 11 engine houses; auto steam fire engines will be installed in most houses; also plans for erection of 10 houses in Brooklyn.

Syracuse, N. Y.—Another ordinance calling for installation of a new central office fire alarm system is being considered by Council.

Winston-Salem, N. C.—Mayor Bellenger has recommended purchase of 2,000 ft. of hose, one hose wagon and erection of station.

Connellsville, Pa.—Following recommendations have been made by Underwriters' Association: Purchase of chemical wagon, aerial truck and hook and ladder truck. Improvement of fire alarm system and erection of central fire station.

Easton, Pa.—Council is considering purchase of new apparatus.

Harrisburg, Pa.—Finance Committee has approved ordinance for purchase of 2,500 ft. of fire hose.

Central Falls, R. I.—Chief Engineer Lees has recommended purchase of 1,000 ft. of hose, steam fire engine, city truck, fully equipped with long ladders, and two fire alarm boxes.

Ipswich, S. D.—Volunteer fire department has been organized.—W. E. Herrick, Chief.

Bountiful, Utah.—Erection of hose house on Main st. is being urged.—John Ledingham, Chief.

Montpelier, Vt.—City is considering purchase of auto fire truck.

Clifton Forge, Va.—J. A. Gleason desires information and prices on automatic fire apparatus, including motor trucks or fire engines with ladder attachment and adapted to hose carrying.

CONTRACTS AWARDED

Gadsden, Ala.—To American-La France Co. for 2,000 ft. of fire hose, ladder and four nozzles.

Brynard, Minn.—Furnishing 500 ft. of fire hose, to Nott Hose Co., Minneapolis.

New York, N. Y.—To the Fisk Rubber Co., of Chicopee Falls, Mass., for equipping the New York City Fire Department apparatus with pneumatic tires.

Cincinnati, O.—Building engine house for Co. No. 11, to Cotterell Building Co.

Seattle, Wash.—Electric chassis for hose wagon to operate from station No. 5, to Northwestern Supply Co., \$3,800.

Seattle, Wash.—Laying fire alarm and police telegraph cable, to Standard Underground Cable Co., \$1,441.

BRIDGES

Pasadena, Cal.—Citizens will vote Apr. 28 on \$100,000 bridge bonds.

Sacramento, Cal.—Plans will be prepared by the County Surveyor for construction of a bridge over American River; cost \$30,000.

Topeka, Kan.—Commissioners of Shawnee and Jefferson counties are considering formal plans for erection of \$30,000 bridge at Grantville.

Georgetown, Ky.—Scott County Fiscal Court has determined to build seven new bridges in this county.

Preston, Md.—County Commissioners of Caroline and Dorchester counties have decided to construct bridge over Linchester River at Black Landing.

Holyoke, Mass.—Board of Aldermen has voted \$35,000 loan for South Main and Cabot st. bridges.

Hoboken, N. J.—Governor Wilson has signed bill which permits the Hudson County Board of Freeholders, upon request of Hoboken and Weehawken, to construct viaduct at Wi low ave. over tracks of the Erie and New Jersey Junction Railroads.

Camden, N. Y.—Town will build steel bridge over Fish Creek.—Paul Schultze, County Engineer.

Washington, N. C.—New Hanover County will vote May 31 on \$50,000 of bonds for bridge and road construction.

Bellefontaine, O.—Plans are being prepared for construction of an arch bridge over Bluejacket River on Main st.—John R. Fawcett, City Clerk.

Cincinnati, O.—City Engineer F. H. Shipley has estimated cost of constructing foundations and substructure of the Gilbert ave. viaduct at \$71,500.

Bethlehem, Pa.—Modern bridge, costing \$250,000, will be erected over Lehigh River between this place and South Bethlehem.

Meadville, Pa.—Need of bridge over French Creek in Mead ave. is being urged.

West Chester, Pa.—Committee appointed by Chester County Court has approved application for erection of bridge over White Clay Creek in New London Township.

Galveston, Tex.—Board of County Commissioners will ask new bids for erecting bridge over Todd's Bayou.

CONTRACTS AWARDED

Batavia, Ill.—Building Wilson st. cast bridge, bids opened April 20, to Carl J. Erman and John MacKimmie, \$30,500; other bidders, Cornelius Collins, city, \$14,000; Souber & Paulson Construction Co., Lockport, \$37,200; Cullen & Friedstedt Co., Chicago, \$45,000; Pitts & Dougherty, Lockport, \$41,700; Joliet Bridge and Iron Co., Joliet, \$37,800; John J. O'Heron & Co., \$38,100; the Gould Construction Co., Davenport, Ia., \$36,750; Wolcott-Jones Construction Co., city, \$33,150.

Petersburg, Ind.—To Harley Kimman, city, for construction and repair of 26 bridges in Warrick County, and for construction and repair of 11 bridges in Spencer County.

Clinton, Ia.—Building bridges across 4th st., Lyons, to P. V. Clarke, \$2,073.30; estimate, \$2,244.10.

Kansas City, Kan.—To Western Bridge Co., Harrisonville, for improvements to 5th ave. bridge, \$9,400; other bidders were: A. E. Harper, \$10,250; Missouri Bridge and Iron Co., \$11,421; Indiana Bridge Co., \$12,618; Missouri Valley Bridge and Iron Co., \$13,790; Illinois Steel Bridge Co., \$16,744; Kansas City Bridge Co., \$14,700; A. M. Blodgett Construction Co., \$14,500.

Lawrence, Kan.—Building two bridges, to Jos. Cox, by County Commissioners.

Jersey City, N. J.—By Hudson Boulevard Commissioners for Boulevard bridge over Central Railroad of New Jersey, to Joseph Murphy & Son, Inc.; bridge to be constructed of concrete and steel, \$69,999; next two lowest bidders were Hellman, Delahanty & Ferris, \$86,300, and H. H. Itolmes, \$87,000; to Vulcan Rail and Construction Co., Brooklyn, repairing of Pennsylvania Railroad bridge, \$6,612; Snares & Triest Co. bid \$7,651, and Oltmer-Schback Co., \$8,115.

New York, N. Y.—To Kindling Machine Co., Milwaukee, Wis., for furnishing patented kindling street sprinklers of the squeegee type.

Saranac Lake, N. Y.—Cleaning pavement of village, by Board of Trustees, to F. Williams, \$169 per month.

York, Pa.—Installing 1,620 street signs to Wm. J. Hartman, -8c. each.

Rotan, Tex.—Building city hall, to R. Holden, \$9,600.

Racine, Wis.—Collecting garbage throughout city, to Henry Devine.

TOO LATE FOR CLASSIFICATION

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
New York	Albany	May 1, 3 p.m.	Grading, setting granite curbs, and paving with repressed vitrified shale paving blocks on portions of various streets, laying concrete sidewalks, building receiving basins and lay. vitrified pipe sewers and appurtenances.	Isidore Wachsman, Secy. Bd. C. & Geo. M. Adair, Street Comr.
New Jersey	Perth Amboy	May 1, 8:30 p.m.	Constructing bitulithic pavement on two streets.	J. E. Reyburn, Mayor.
Pennsylvania	Philadelphia	May 1	Repairing asphalt pavements in various streets.	
New Jersey	Avalon	May 1, 8 p.m.	Grading, graveling and curbing about 4,600 lin. ft.; sand filling by hydraulic dredge 45,000 cu. yds.	Gilbert S. Smith, Peermont, Mayor
Mississippi	Grenada	May 1	Constructing about 150,000 ft. granolithic sidewalks.	L. B. James, City Recorder.
Indiana	Logansport	May 2, 10 a.m.	Constructing gravel roads in Jefferson township.	John E. Wallace, County Auditor.
Michigan	Charlevoix	May 2	Paving 3 streets with macadam, bitulithic, creosoted wood block, concrete or other material; constr. curbs and gutters.	E. J. Hiller, City Clerk.
Pennsylvania	McKeesport	May 2, 8 p.m.	Repairing with vitrified brick various streets and laying brick and concrete sidewalks.	C. E. Soles, City Comptroller
Kansas	Pittsburg	May 3, 4 p.m.	Pav. about 4,500 sq. yds. with vit. brick on concrete base.	L. E. Curfman, City Eng'r.
Maryland	Baltimore	May 3, 11 a.m.	Grading, constructing storm drains, concrete catch basins, laying fibre conduit, constructing lamp-post foundations, bitumen macadam work, concrete curbs, etc., in Swan Avenue and Druid Hill Park and Riverside Park.	
Indiana	Rockville	May 3, 1:30 p.m.	Constructing gravel road in Howard township.	J. Barry Mahool, Pres. Bd. Award
Ohio	Cleveland	May 3, 11 a.m.	Grading and improving portion of Harvard road.	James E. Elder, County Auditor.
Indiana	Ft. Wayne	May 9, 10 a.m.	Furn. crushed gravel for roads in Allen County.	Frank R. Lander, County Surveyor
Maryland	Baltimore	May 10, noon	Constr. 37.10 miles of State Hwy. in twenty counties.	Calvin H. Brown, County Auditor
Ohio	Cincinnati	May 19, noon	Constr. Compton rd. in Hamilton Co.; mac. exten. of Struble rd.	John M. Tucker, Chm. S. R. Com.
California	Lodi	May 15	Macadamizing streets, cost of work about \$42,432.65.	Stanley Struble, Pres. Co. Comrs.
Ohio	Cincinnati	May 22, noon	Grade, cement park lot surrounding Public School.	City Clerk.
Minnesota	Minneapolis	Apr. 28, 7:30 p.m.	Furn. 5,000 sq. yds. of granite blocks; also lumber for use during year ending May 1, 1912.	C. W. Handman, Business Jan
SEWERAGE				
New Jersey	Trenton	May 2, 8 p.m.	Constructing sewer with house connections.	Harry B. Salter, City Clerk.
New Mexico	East Las Vegas	May 17, 4 p.m.	Constr. 19,750 lin. ft. 8-in. vitrified sewer; 3,350 lin. ft. 10-in. and 100 lin. ft. 15-in.; 50 manholes; 12 single flush tanks com.	Chas. Tamme, City Clerk.
Ohio	E Youngstown	May 22, noon	Constructing sanitary sewer.	J. P. Carney, Village Clerk.
WATER SUPPLY				
New York	Albany	May 1, 3 p.m.	Furn. iron body, bronze mounted fire hydrants.	Isidore Wachsman, Secy. Bd. C. & F. B. Knoff, Village Clerk.
Minnesota	Madison Lake	May 1, 6 p.m.	Installing a water works system.	M. E. Kenny, Pres. Bd. Trustees.
California	Corning	May 2, 8 p.m.	Constructing a water works system complete.	Board Water Supply.
New York	New York	May 4, 11 a.m.	Construct. a conc. and c. i. pipe cond. for the Wakefield ave bluff	W. E. Donner, Engr. Grant Is. Nel
Nebraska	Chappell	May 8, noon	Constr. w. w. and an electric light plant.	
BRIDGES				
Indiana	Bloomfield	May 1, 2 p.m.	Constr. 3 bridges of 70, 60 and 40-ft. spans, respectively.	C. H. Jennings, County Auditor.
Indiana	Decatur	May 2, 10 a.m.	Constr. 4 bridges and 6 arches, and the repair of 3 bridges.	H. S. Michaud, County Auditor.
Indiana	Mt. Vernon	May 3	Constructing 4 bridges in Black twp. and 2 in Robb twp.	County Commissioners.
Pennsylvania	Hollidaysburg	May 5, noon	Repairing 5 bridges in Blair County.	W. S. Hostler, Clk. Co. Com
Indiana	Shelbyville	May 8, 10 a.m.	Constr. a bridge in Sugar Creek township and constructing concrete abutments and the repair of St. Paul bridge.	G. B. Huntington, County Auditor
Maryland	Baltimore	May 10, noon	Constructing one concrete bridge in Calvert County.	John M. Tucker, Chm. S. R. Com.
MISCELLANEOUS				
Minnesota	Duluth	Apr. 27, 4 p.m.	Furn. 1 automobile wagon, 30 H.P., carrying 2,000 lbs.	L. N. Case, Mgr. B. W. & L. Com
New Jersey	Perth Amboy	May 1, 8:30 p.m.	Making repairs to the fire houses of the city.	Wilbur Laroe, City Clerk.
Maryland	Baltimore	May 3, 11 a.m.	Furnishing a preparation for laying dust and preserving macadam roads; with the use of three sprinklers to Oct. 15, 1911.	J. Barry Mahool, Pres. Bd. Awar

PROPOSALS

NOTICE TO CONTRACTORS

Police Signal, Fire Alarm and Telephone System

Passaic, N. J.

By direction of the City Council proposals will be received by the City of Passaic, New Jersey, from contractors for the manufacture, delivery and installation of a Police Signalling System, Fire Alarm Equipment and Municipal Telephone Exchange for the City of Passaic, in accordance with the conditions and specifications and drawings on file in the office of the City Clerk, from whom blank form of proposal may be obtained.

All proposals must be for the entire work, as no separate bids will be received for any part of the work.

All proposals must be accompanied by a surety bond or a certified check payable to the City of Passaic in a sum equal to at least 2 per cent of the amount of the bid.

The successful bidder will be required to give a surety bond in a responsible surety company for the full amount of the contract for the faithful performance of the contract and for indemnity against suits or claims for infringement of patents and as security that he will guarantee all workmanship and materials for a period of five years.

Every bidder must furnish satisfactory evidence of his experience and equipment, together with list of similar systems installed.

All bidders must state number of working days required to complete work, and damages of ten dollars per day will be stipulated in the contract for every day's delay over the time agreed upon for the completion of the work.

No bid will be considered unless samples of the following are submitted therewith: One multiple circuit puncturing register.

One automatic time and date stamp.

One take-up reel.

One central station flash light equipment.

One police box.

One flash light.

One flash light controller.

One fire alarm box.

One automatic fire alarm repeater.

All bids must be enclosed in a sealed envelope endorsed on the outside "Proposal for Police Signaling System, Fire Alarm Equipment and Municipal Telephone Exchange," and must be delivered to the City Clerk or his deputy on or before Friday, May 19, 1911. No bid will be received after 8:00 p. m.

The City of Passaic reserves the right to reject any or all bids.

M. B. MATTHEWS,

Chairman Committee on Public Safety.

THOMAS R. WATSON,

City Clerk.

(26-3-10)

BRICK PAVING

Hudson, N. Y.

Sealed bids will be received until 10:30 a. m., May 2, 1911, by the Secretary of the Commission of Public Works of the City of Hudson, N. Y., for furnishing material and labor necessary to relay approximately 5400 lin. ft. of curbstone and to pave about 13,800 square yards of street with vitrified brick.

Plans and specifications may be seen at the office of the City Clerk or the City Engineer.

The Commission of Public Works reserves the right to reject any and all bids

WILLIAM WORTMAN,

City Clerk.

M. J. O'HARA,

City Engineer.

HIGH LEVEL INTERCEPTING SEWER CREEK CROSSING, COMPLETED

INTERCEPTING SEWER AND SEWAGE PUMPING STATION

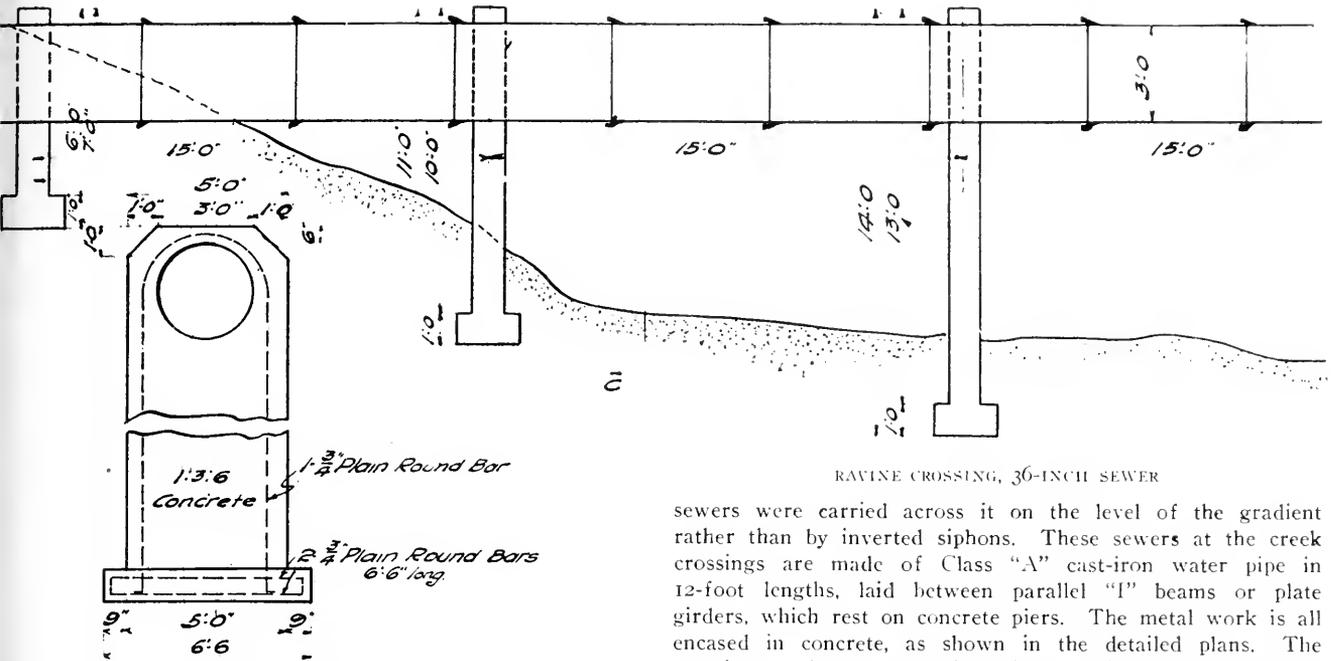

Carrying Large Pipe Sewers Across Creeks at Hydraulic Gradient—Reinforced Concrete Pipe in Tunnel—
Pump Well Forty-Seven Feet Deep—Motors Sixty Feet Above Pumps.

By ROBERT HOOKE, City Engineer

The city of Chattanooga, Tennessee, lies partly in a bend of the Tennessee river, having the latter as its northern and western boundary. Passing through the southern portion of the city is a small stream, known as Chattanooga creek, which discharges into the Tennessee river at the base of Lookout Mountain, about a mile below the city's southern limit. The sewage of Chattanooga, like that of other American cities similarly situated, is discharged directly or indirectly into the river which skirts its borders. Ten of the main sewers of the combined and one of the separate system of sewerage have their outlets into the river, while three

main of the former and two of the latter system have their outlets into Chattanooga creek.

The low water discharge of the Tennessee river at Chattanooga is estimated at 8,000, and the maximum high water discharge 700,000 cubic feet per second. During the low water season the creek discharge may get as low as 20 cubic feet per second, but heavy local rains within a few hours bring it to a flood stage and, when the river itself is not at flood stage, develop a strong current. During protracted dry periods the odor from Chattanooga creek, arising from decomposing sewage, has on a few occasions proved offensive

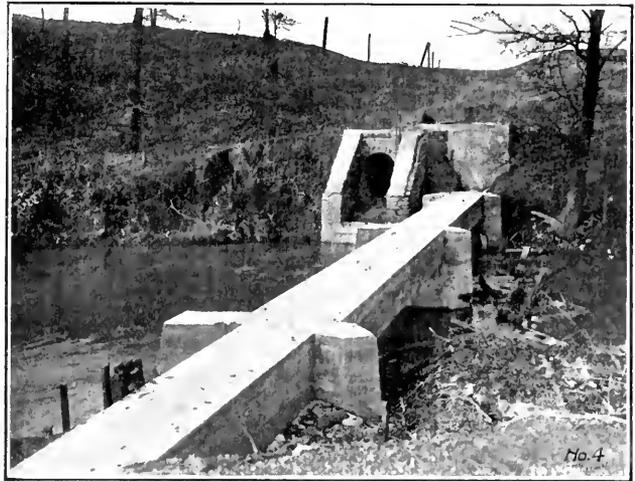

RAVINE CROSSING, 36-INCH SEWER

sewers were carried across it on the level of the gradient rather than by inverted siphons. These sewers at the creek crossings are made of Class "A" cast-iron water pipe in 12-foot lengths, laid between parallel "I" beams or plate girders, which rest on concrete piers. The metal work is all encased in concrete, as shown in the detailed plans. The crossing on the 20 and 24-inch lines consists of two spans of 30 feet each, 18-inch "I" beams 60 feet in length being used in each case. At the crossing of the 36-inch sewer there are three 20-foot spans and one 40-foot span, 36-inch plate girders being used in the latter and 18-inch "I" beams in the former. By using a low-unit stress for the flanges of the girders, say

The high-level intercepting sewer has been completed, and is now receiving the sewage from the Sidney street and Williams street sewers, except when the latter are inundated by back water from the creek. The pumping plant has not yet been completed, and consequently the discharge from the three sewers further up the creek is not being conducted to this plant, although the low-level interceptors for doing so have been completed. The present maximum dry-weather flow from the Washington street sewer is 2.2 cubic feet per second, and that from the two sanitary sewers which drain into the 24 inch line is about 0.3 cubic feet per second, these two latter draining a territory which is as yet but sparsely inhabited.

Back water from the creek will frequently enter the Washington street sewer. As it is not desirable to have this water flow to the pumping station, the 20-inch intercepting sewer will at such times be closed automatically until the back water recedes. This automatic closing of the 20-inch sewer will also take place when the Washington street sewer is discharging more than a certain volume of storm water. The automatic

CREEK CROSSING OF 20-INCH INTERCEPTING SEWER, AND OLD OUTLET OF WASHINGTON STREET SEWER

HIGH LEVEL INTERCEPTING SEWER AT CREEK CROSSING

closing device consists of a flap valve at the end of the 20-inch pipe, which is opened and closed by means of a float as the water in the sewer falls and rises.

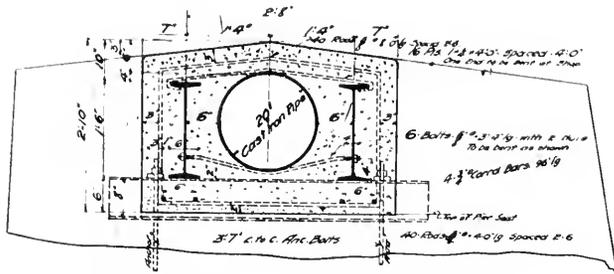

The low-level sewers are constructed of vitrified pipe except at the creek crossings, which are described further on. Reinforced concrete pipe 36 inches in diameter was used for the high-level interceptor except where this was carried across the creek or through depressions below subgrade, in which cases cast-iron pipe was used. This 36-inch sewer was carried under a number of railroad tracks and 600 feet of it was constructed in tunnel.

As the creek was not in any sense a navigable stream, the

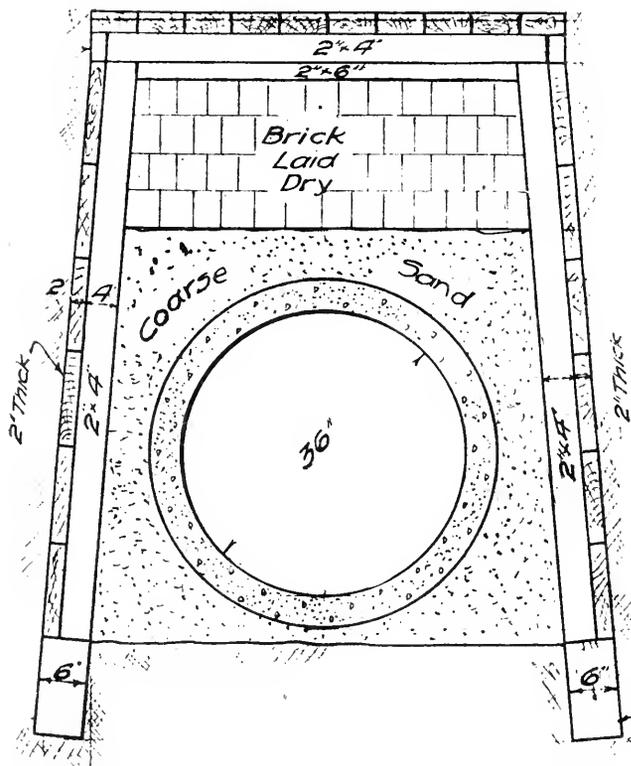

SAME AS ABOVE, DURING CONSTRUCTION

10,000 or 12,000 pounds per square inch, and not too great a ratio of length to depth of girder, the deflection will be of little consequence as affecting the grade of the pipe. By using shorter lengths of pipe than 12 feet it would have been quite practicable to so place the pipe before the concrete is deposited around it as to allow for the deflection due to the weight of the latter.

CROSS-SECTION OF CREEK CROSSING, 20-IN. PIPE

This design for carrying sewers across creeks was introduced by the writer some three years ago with such satisfactory results that he adopted it in the present instance as the one which, if not the least expensive, would be the most effective in withstanding flood and weather conditions with a minimum amount of care and attention. These crossings have been submerged by floods four times this year and without injury.

REINFORCED CONCRETE PIPE IN TUNNEL UNDER RAILROAD TRACKS

SEWAGE PUMPING STATION

This is located on the south bank of Chattanooga creek near the southern boundary of the city in a section not yet built up. The pump well is circular in form, 36-foot interior diameter at the bottom, and is divided into four separate chambers, consisting of a receiving chamber and three pump chambers. The sewage will first enter the receiving chamber, from which it may be diverted at will into either of the three pump chambers by means of 20-inch Coffin sewer shear gates, operated by hand. The bottom of the pump well has an elevation of -4.0 referred to the city datum. The roof of the pump well has an elevation of 43.0. From this roof, or rather from the plate girders supporting the roof, is erected a steel frame for supporting the rectangular motor room, the floor of

which is to have an elevation of 55.25 or 59.25 above the bottom of the well. The object in placing the motors at this height was to have them above the level of all but one of the three greatest floods which have occurred in the Tennessee river at Chattanooga. The pump well will be entered by means of a concrete stairway anchored to the circular concrete wall of the well, which stairway is reached from a door at the north side of the well at an elevation of 30. The motor room will be made accessible by means of reinforced concrete stairway erected on the roof of the pump well.

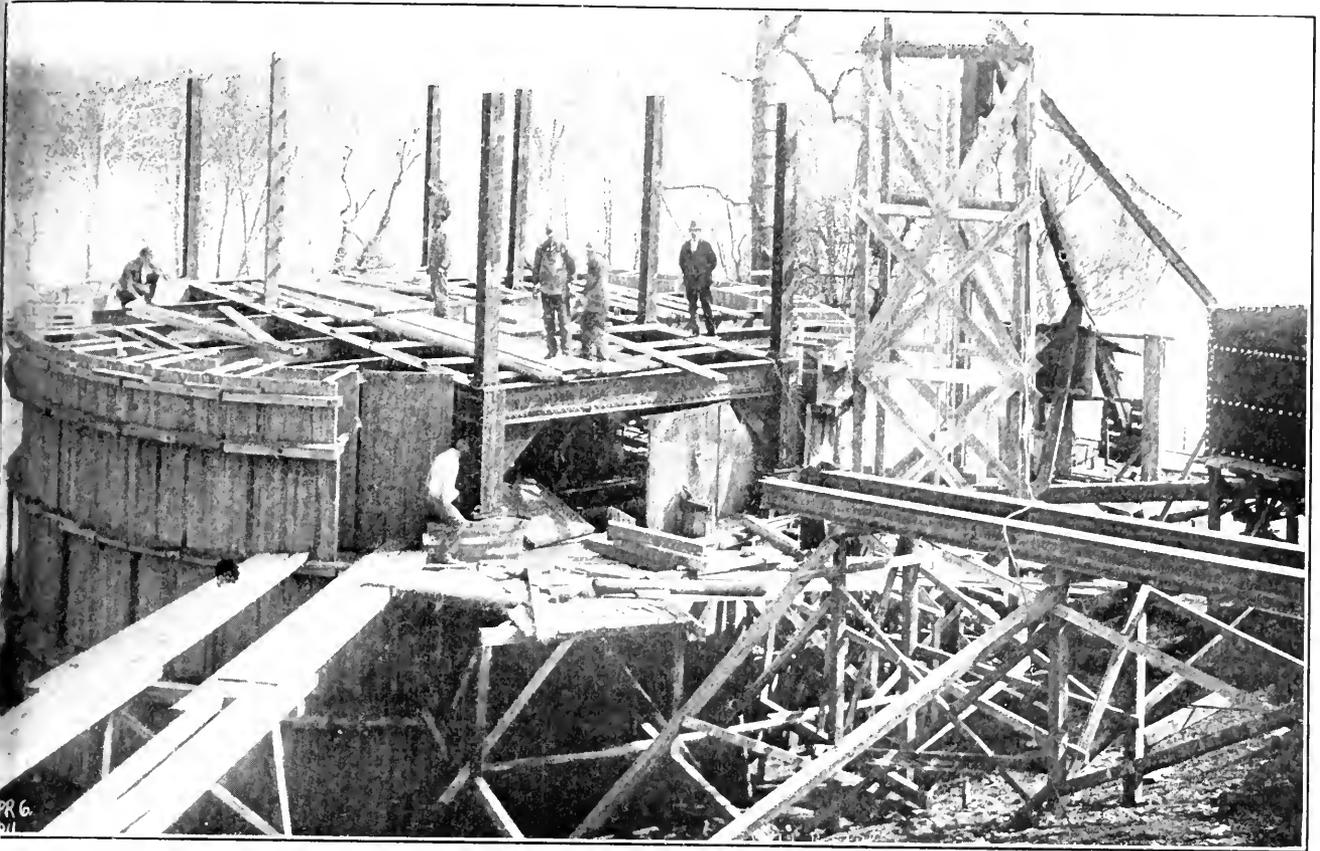

The pump well will at present be supplied with two 12-inch centrifugal pumps, each direct connected by means of a vertical shaft to a 75-horsepower electric motor, provision being made for the future installation of a third pump, to be located in the middle pump chamber whenever—by reason of the construction of the proposed additional low-level sewer to this pumping station—increased pumping capacity becomes necessary. The capacity of each of the two 12-inch pumps is designed to be 10 cubic feet per second against a mean actual head of 26.25 feet. The pump shaft, which is of somewhat unusual length (about 60 feet) on account of the great elevation of the motor-room floor above the bottom of the well will be carried on a ball-bearing located just below the motor.

To prevent the possibility of the motors being subjected to overload when working under a reduced head for a considerable period, they have been made of higher power than would otherwise have been required. The present combined dry-weather flow of sewage from the two sewers discharged into the pump well during the morning hours, when at maximum, is 2.5 cubic feet per second. The combined capacity of the two sewers when flowing full would be 20.0 cubic feet per second. Provision is therefore made for a large future increase in the volume of sewage to be carried to this pumping station. At present it is intended to admit rainfall into these two sewers to the limit of their capacity when not working under head, when 18 to 20 cubic feet will be delivered to the pumps.

Ordinarily a single pump, working intermittently, will handle all the dry-weather flow, pumping the sewage from a height

INTERIOR OF PUMP WELL Showing steel reinforcement of partition walls

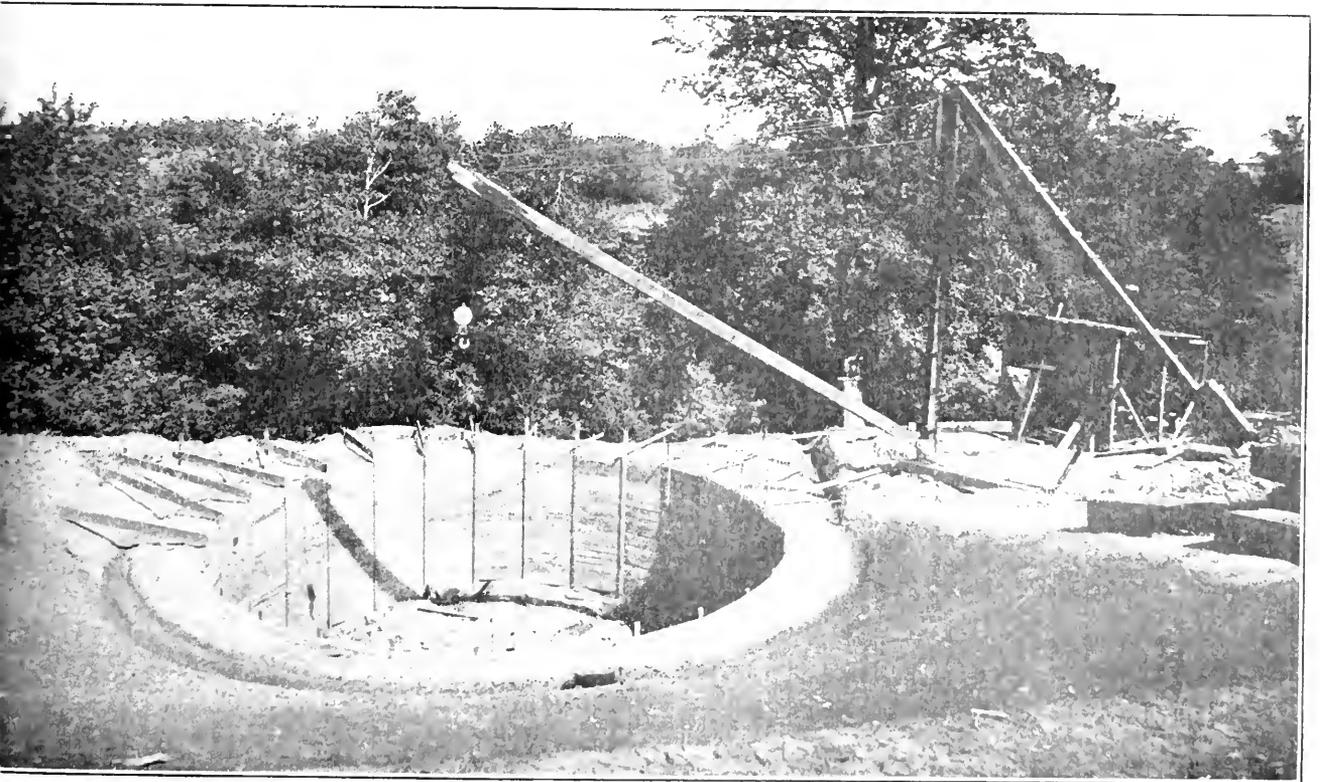

PUMP WELL OF SEWAGE PUMPING STATION

Portion of steel framework which is to support motor room is in place.

6 feet above the floor of the well down to a level with the surface thereof (the pump itself being placed in a pit pressed below the floor level), when the pump will be automatically stopped. It will be automatically started again when the sewage level has again reached the height of 6 feet above the bottom of the well. When the volume discharged to the first well is, by reason of rainfall, increased beyond 10 cubic feet per second, the single pump working will not be

able to prevent the rise of the sewage level until it flows through the 18-inch iron pipe into the chamber where the other pump is located, which also will be started automatically when the sewage has attained a certain depth around it, and the second pump will be automatically stopped when the discharge into the well is reduced to 10 cubic feet per second.

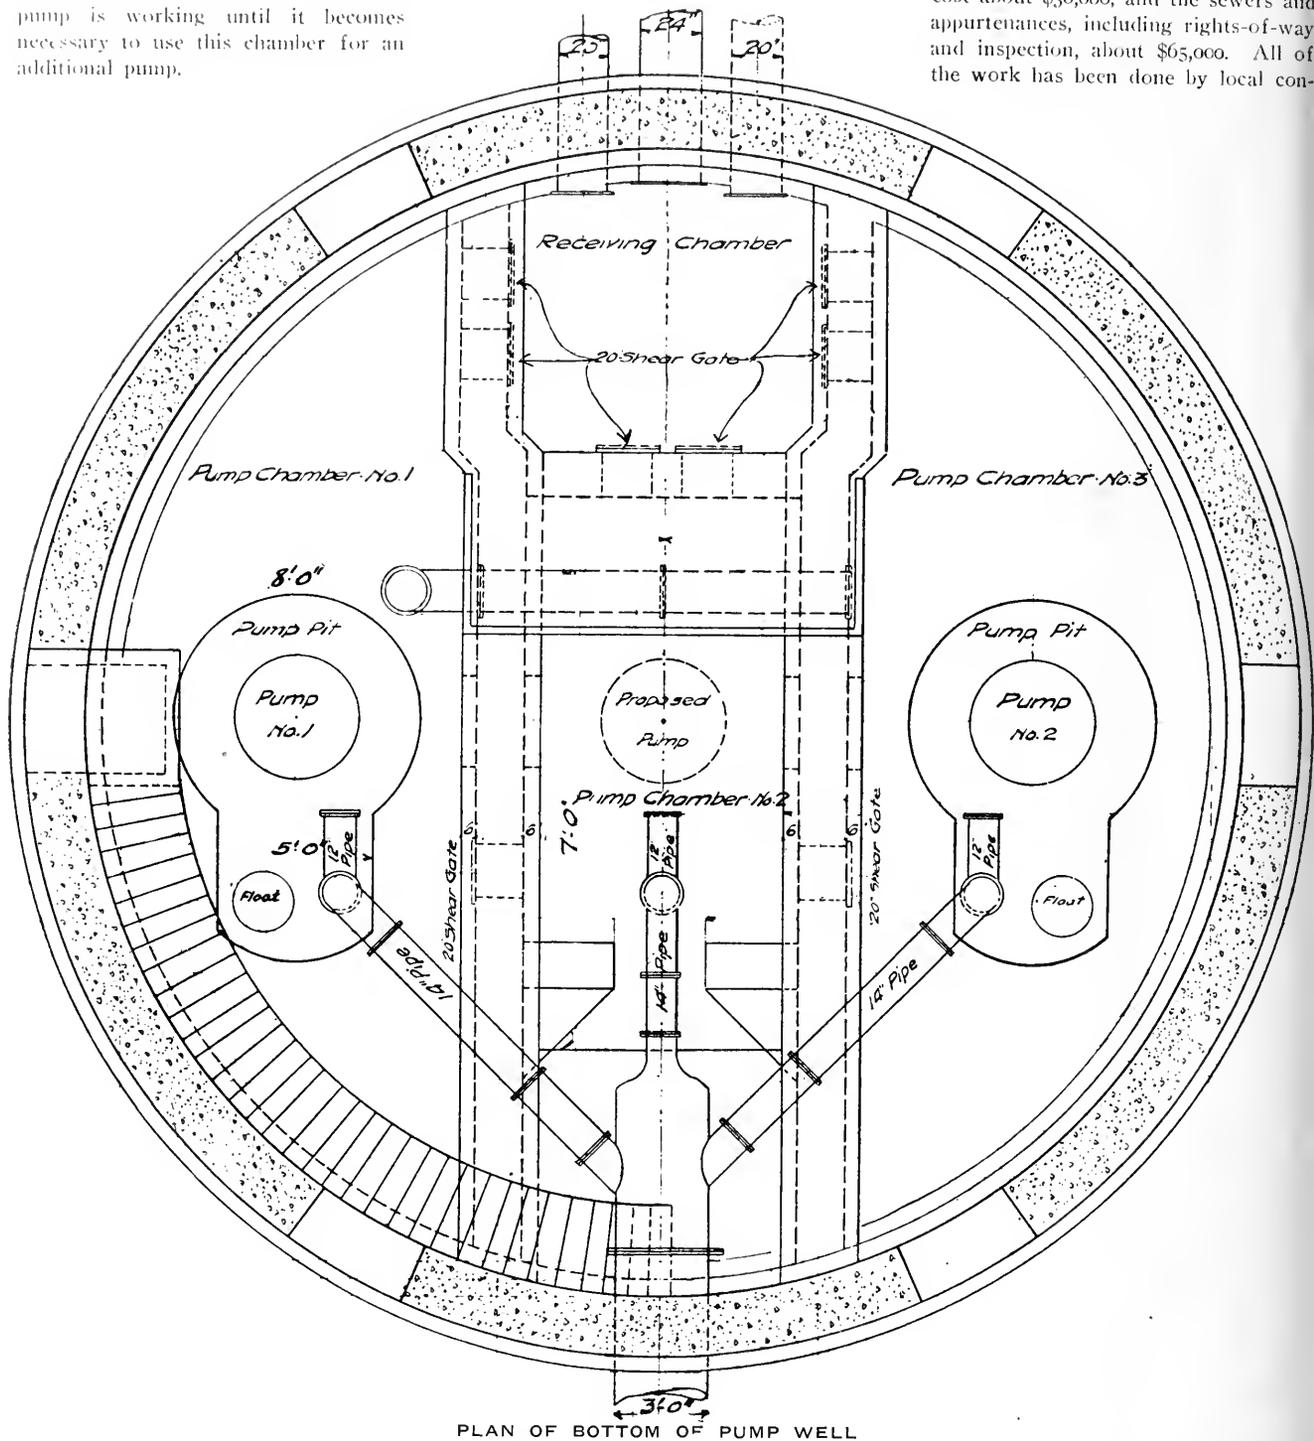

In order to increase the capacity of the storage reservoir

VIEW OF PUMP WELL OF SEWAGE PUMPING STATION, SHOWING SOLID ROCK IN BOTTOM

for sewage, and thus increase the length of the working periods of the pump, the middle chamber will be used in conjunction with the one in which the pump is working until it becomes necessary to use this chamber for an additional pump.

tion and machinery equipment and the two-acre lot on which the station is erected, including residence of attendant, will cost about \$30,000, and the sewers and appurtenances, including rights-of-way and inspection, about \$65,000. All of the work has been done by local con-

R. D. Wood & Company, of Philadelphia, Pa., will furnish the pumps and the General Electric Company the electric motors and automatic starters. The pumps and motors have for some months been ready for shipment, but on account of the delay in the completion of the building, owing largely to floods, the contractor is not yet ready to begin their erection. It is hoped that the pumps will be in operation by the middle of June.

COST OF THE WORK

The original estimate of the cost of the intercepting sewer, pumping station and machinery, including site, rights-of-way and inspection, was \$95,000, and the general council provided for this work the sum of \$100,000. It now seems that the final cost will not exceed the original estimate. The pumping sta-

tractors—the sewer work by the Noll Construction Company and the pumping station by H. S. Bosler.

ADDITIONAL SEWERAGE STATISTICS.

Since making out the table of sewerage statistics we have received an additional report from Seattle, Wash., stating as follows:

Construction is in charge of the city engineering department, and maintenance of the street and sewer department. There are 8,382 inlets with catch basins, none without, of which 1,511 were built during the year. There were 60,183 cleanings of catch basins, by which 30,520 cubic yards of material were removed, spoon shovels being used. There are 314.17 miles of combined sewers in the city, of which 57.72 were built by contract during the year. There are 4,633 manholes and 382 flush tanks in the system. In addition, sewers are flushed by hose attached to fire hydrants. Ventilation is through manholes.

VALUE OF NEW YORK'S GARBAGE

Method of Treating It at Barren Island — Amounts Treated — Sums Received by Company from City and for Salable Products

THE commercial value of New York's garbage to the contractors who dispose of it, the New York Sanitary Utilization Company, is about \$400,000 a year (when delivered to them at the docks), in addition to the \$200,000 a year which the city pays the company under the terms of a contract which will expire in 1912. The cost to the city of collecting the garbage and delivering it to the docks (after which the company bears all expense) exceeds by about \$50,000 the actual commercial value.

The figures given in this article, taken from various official reports and other reliable sources, show that in the year 1908 the total amount of garbage handled was 328,646 tons. According to the estimate here presented the value of this garbage, that is, the net revenue derived from the reduction process, was \$369,216. In addition to this, the company received the sum of \$192,444 from the city, under the terms of the contract. The cost to the city of collecting the garbage and hauling it to the docks was \$420,422.

A brief sketch of the process of reducing the garbage and extracting the valuable ingredients which is now in use was given by Edward D. Very in 1908, in a paper before the New York Section of the Society of Chemical Industry. The figures quoted in this article are taken from records for the year 1908, and refer to the process and machinery then in use, but we believe that many of them have not heretofore been published. Since that time machinery for extracting grease by the use of naphtha has been installed.

Mr. Very described the operations as follows:

At Barren Island the garbage is packed onto an outboard conveyor and is then conveyed to the second story of the plant and passes through chutes to the digesters. Its reduction is then accomplished by the Arnold-Edgerton process, which is performed purely by mechanical means. The digesters are large tanks holding approximately eight tons. When filled, they are sealed by a cap which is held on by bolts. Steam is introduced into the digesters at 80 pounds pressure and the mass is cooked for a variable time, depending on the material, which varies from season to season. The vapor escaping through the vent is condensed by a jet condenser and thence passes to a sewer.

From the digester the material, which is now a pulpy mass, is removed to a tank, which has a capacity of four digesters, for the purpose of facilitating the work. From the tank it is run into forms made of sacking and racks and then put under an hydraulic press. Pressure is then applied and the water and grease are expressed. The water and grease go to a perforated trough, and thence by pipes to a settling basin, where, by flotation, the grease is separated and then taken off and barreled. The residue from the press, known as tankage, is carried by conveyor to a direct heat dryer, where the remaining moisture is driven off; and from the dryer passes to a screen, where the material is ground and screened. From the screen the material falls through chutes into hoppers and thence to bags for shipment.

The average garbage received at the plant contains: Water, 71 per cent; rubbish, 6 per cent; tankage, 20 per cent; grease, 3 per cent. The grease is of low grade and dark brown color. It is largely used in making soap and candles. The greater portion is shipped abroad. Tankage is the solid, fibrous matter, and is used as a fertilizer base or filler. It contains a small percentage of nitrogen, ammonia, phosphoric acid and potash. The liquid from the grease has no value, as it contains a very small percentage of ammonia.

The following is an estimate of the receipts and expenses of the Utilization Company in 1908, made as the result of an official investigation:

Receipts

Garbage, 3 per cent of total garbage, 9,859 tons, at \$60.	\$591,540
Tankage, used for fertilizer, 65,729 tons, at \$5.....	328,646
Cash from Department of Street Cleaning.....	192,444
Total receipts	\$1,112,630

Disbursements

Transportation, from docks to works, by scows, 328,646 tons, at 12c. per ton.....	\$39,437.52
Unloading, 5c. per ton.....	16,432.30
Coal, 22c. per ton of green garbage reduced.....	72,800.00
Labor, 14c. per ton.....	46,800.00
Repairs and supplies, 5 per cent.....	50,000.00
Depreciation, 10 per cent.....	100,000.00
Administration and legal expenses.....	225,500.00
Balance, gross profit.....	561,660.18

Total\$1,112,630.00

The capital stock of the company is \$1,300,000; for a 6 per cent dividend \$78,000 would be required. The sum of \$192,444 paid by the Department of Street Cleaning is also included in the gross profit as stated above. The net value of the garbage delivered at the docks in 1908 was than \$369,216, or if dividends are deducted \$291,216.

In order to fully understand these figures some further information regarding the items follows:

Tons.—A cart load is assumed to weigh one ton. This estimate was confirmed by exhaustive tests made by Messrs. Parsons, Hering and Whinery in connection with a report to the Board of Aldermen December 31, 1907. The number of cart loads delivered by the city at the docks to the company in 1908 was 328,646.

Grease and Tankage.—The percentage of grease recovered from New York garbage by the process employed has been reported to be 3 per cent. The average price for grease in 1908 was \$60 per ton. The tankage, which is used for manufacturing fertilizers, has been stated to be 20 per cent, and its value is put at \$5 per ton.

Transportation.—The estimate of 12 cents per ton for transportation by scows is based on the city's contract for disposing of ashes and rubbish in a somewhat similar manner. The price which it pays for this is 17 cents for transporting and unloading, but the nature of the work is considerably more expensive than that involved in the handling of garbage. The following estimate of cost of unloading alone is submitted. The average scow carries 300 tons. Ten men at \$1.50 per day easily unload one scow in a day, making the cost 5 cents per ton.

Coal.—The total annual consumption of coal at the reduction plant is reported to be 18,200 tons, estimated to cost \$4 per ton, or \$72,800 = 22 cents per ton of garbage.

Labor.—The estimate of labor is obtained from observation. The average number of men employed is about 70. The average weekly payroll is \$900; the annual payroll \$46,800, making the labor cost per ton of green garbage handled 14 cents.

Repairs and Supplies.—The figure of \$50,000 is assumed arbitrarily.

Depreciation.—The value of the plant is assumed to be within \$300,000 of the capitalization of the company, and 10 per cent is allowed for depreciation, permitting renewal every ten years. The allowance for depreciation is \$100,000.

Administration and Legal Expenses.—These are assumed to be \$225,000. (Probably covers expenses which will not bear too close inspection.)

Interest or Dividend.—This is figured at 6 per cent on the capitalization of \$1,300,000. The profits over and above the amount paid by the city appear to be \$291,216.18, or 22 per cent on the capital stock.

Regarding the cost to the city of collecting the garbage and delivering it to the company at the docks, the following figures are reported for 1908:

Boroughs	Cart Loads	Cost per Load
Manhattan	195,439	\$1.32
Brooklyn	27,839	1.43
Bronx	105,368	1.18
Total	328,646	

The sums paid by each borough to the company under the terms of the contract for disposing of the garbage after delivery are as follows:

Manhattan	\$148,000
Brooklyn	19,444
Bronx	25,000
Total	\$192,444

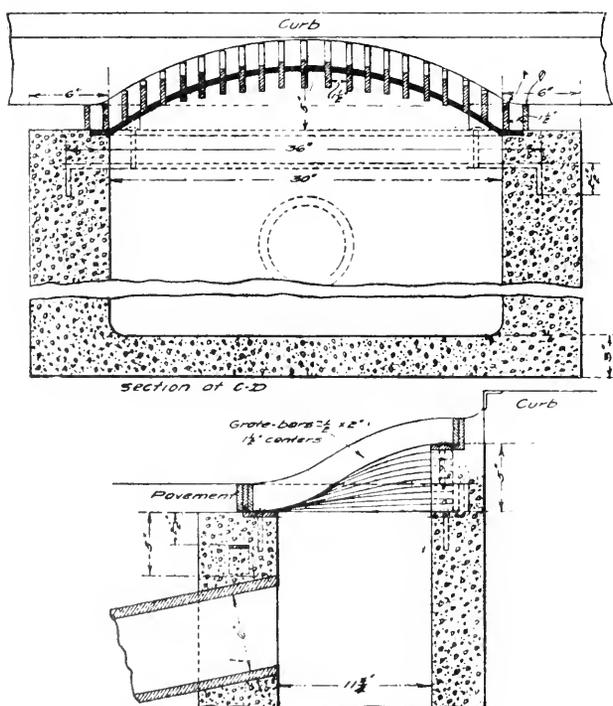

CATCH BASIN DESIGNS

Gratings and Special Forms of Gutters—Gratings or Bars For Curb Openings—Connection to Sewer

The standard catch basins of Portland, Ore., are simple rectangular wells about 5 feet deep below the roadway surface and about 12 by 30 inches inside dimensions, with walls 6 inches thick. The pipe connecting this with the sewer is placed with its top about 10 inches below the roadway, thus leaving about 3 feet of basin below the pipe. No traps are provided in the basin. The peculiar feature of the basin is the grating in the gutter. This grating extends 16 inches out from the curb, and is composed of wrought iron bars $\frac{1}{2}$ by 2 inches in section spaced 1 inch apart in the clear. These bars, however, are not flat but are so curved that while the outer ends are flush with the pavement those next to the curb rise in a curve which brings the center bar 5 inches higher than the level of the pavement, or within 1 inch of the top of the curb. The object of this probably is to form a sort of dam in the gutter which will prevent the water from flowing over the bars rather than passing through them, when the gutters are flowing unusually full. The projection in the gutter, of course, interferes with the wheels of a vehicle which might be following close to the curb, but it is not ordinarily necessary that vehicles should do so.

Where we have seen such gratings used we have found, as might be expected, that they did not always act as intended, since the gutter water can easily flow out around the bars, providing any obstruction, such as a piece of heavy paper or twigs and leaves, should collect over the grating.

A better construction, it appears to us, is to form a depression in the gutter at the inlet, this depression being approached by a comparatively long slope from above, and by a much more rapid one immediately below. The depression then serves as

PORTLAND, ORE., CATCH BASIN

a pocket to catch the water coming down the gutter, which can not flow around by way of the pavement. Also, if a paper or other comparatively weak obstacle should spread itself over the grating a head of several inches of water would be formed which would tend to force it through the opening. This depression would form no more objectionable obstacle to wheeled traffic than the Portland grating. It has the additional advantage that it is equally advantageous for use with an opening in the face of the curb, directing the water into such opening and preventing its flowing by. On a steep grade even this depression with a vertical curb opening may not suffice to direct all the water into the catch basin, and in such cases a flat grating of bars placed in front of the curb opening at the bottom of such a depressed gutter will generally be effective. The chief disadvantage of this, perhaps, is the break which it makes in the general appearance of the curb, which may by some be considered objectionable. It does not seem to us, however, that this objection can at all outweigh the practical advantages.

Undoubtedly the gutter grating is more objectionable than the curb opening, and the latter will generally serve the purpose except on quite steep grades, providing it is sufficiently large and not so obstructed by bars or in other ways as to cause paper, leaves, twigs and other matters, such as may be washed from the street surface, to collect in front of and contract the opening. Where a large opening is necessary—and we believe that with modern waterproof pavements these openings are more often too small than too large—some kind of bar is necessary to prevent animals and even small children from falling into the inlet. For this purpose we believe that one or at most two horizontal wrought iron bars set into the masonry at the ends of the opening are better than anything else. These seem less likely to collect such floating materials as we have referred to than do the vertical bars; and should they collect them the water will itself remove them more readily than in the case of the vertical bars. Probably the chief objection is the fact that a comparatively long stick, such as a lath, floating upon the water may be carried into the inlet; but this is possible in the case of the vertical bars also should the stick approach the opening at an angle of 30 degrees or more with the line of the curb.

This matter of storm water inlets is a most important one, and in our opinion has not received anything like the attention which it deserves in most cities. We do not believe that there are any greater absurdities to be found in any of the public works in the city of New York than the catch basin inlets in the Borough of Manhattan. Most of these have curb openings of ample size, but instead of horizontal wrought iron bars many of these openings are provided with heavy horizontal cast-iron bars which carry vertical teeth both above and below, the toothed bar occupying about one-third of the entire area of the opening, but the spaces between the teeth being so small that the effective area of the opening is probably reduced at least 75 per cent and the space between the bottom of the lower teeth and the bottom of the opening being so narrow that it is frequently found stopped with such small articles as apple cores, banana skins, handbills and the like. Other New York inlets are provided with the gutter grating, but instead of having the opening of the basin extend under the grating there is merely a depression cut in the lip of the stone which forms the bottom of the inlet opening, so as to leave a space about one inch deep between the grating and the bottom of this depression. This space is ordinarily found entirely filled with compacted street mud so that it serves no useful purpose whatever. The result is what might be expected, and every storm results in flooded gutters and streets around a considerable percentage of these inlets.

It is of little avail to build sewers of ample capacity if the openings which receive the street water and the pipes which conduct it from the openings to the sewer are not sufficient to remove the water from the streets. This suggests another point in connection with inlets where a great many cities have made mistakes. Because a six- or eight-inch pipe at even a minimum

grade is theoretically of ample capacity as a sewer to carry off all the water which will reach the inlet is not a sufficient reason for using such size of pipe as an inlet connection. When water drops from the gutter into an inlet it has no velocity in the direction of the connection pipe, but is a seething mass having more motion vertically than in any one horizontal direction. Under these conditions the opening which removes the water from the basin must be several times larger than that required for carrying a similar amount under normal flow, since the initial velocity through the outlet is very low and is largely diagonal to the axis of the pipe rather than parallel with it. Theoretically the best form of outlet from the basin would be a flat bell mouth, which might be given the same height as the diameter of the pipe used further out, and a horizontal diameter equal at the opening to the full width of the basin. It would be desirable to have at this opening a grating with vertical bars to prevent sticks and other obstacles from wedging themselves in this bell mouth. Instead of such a bell mouth it would perhaps be more practical to approximate it by a flaring opening made in the masonry, and a pipe capable of carrying the maximum runoff at a velocity of not more than one foot per second. In addition, if there is no catch basin at the bottom of the inlet—as in the majority of cases there should not be—it would be well to round the bottom up from the opening toward the back of the basin in the form of a quadrant of sphere or spheroid.

FUNCTIONS OF HEALTH BOARDS

Non-Sanitary Duties Imposed Upon Them—Garbage Disposal a Matter of Housekeeping, Not Sanitation— Plumbing Inspection.

ON April 10 and 11 there was held at the Massachusetts Institute of Technology in Boston a celebration of the fiftieth anniversary of the granting of the charter of the Institute, a part of which celebration took the form of the presentation of a great number of papers upon technical subjects by graduates of the Institute. Among these was one by Edwin O. Jordan, Professor of Bacteriology of the University of Chicago, in which he enumerated a number of lines of endeavor in public health work which he considered to be fruitless and uneconomical. The reason for this, in his opinion, is the continuance in the public mind of the ideas of a few decades ago concerning the origin and transference of contagious diseases. "Two instances of this confusion," he said, "are found in the demand for garbage disposal and plumbing inspection. Sanitarians do not admit that even a grossly improper method of garbage disposal can have much to do with the spread of disease in a large city, nor that diphtheria or typhoid fever or any other disease is properly attributable to the entrance of sewer air into dwelling houses. So firmly imbedded in public belief, however, is the connection of piles of decaying garbage with outbreaks of infectious disease and of 'defective plumbing' with all sorts of maladies that to the average citizen 'garbage disposal' and 'plumbing inspection' bulk largely as the chief, if not the only, activities of a municipal health department."

According to bacteriology disease germs do not breed in garbage heaps, nor can they continue to exist there. It is true that house flies breed in garbage piles and in manure, and that they may carry disease germs to food in the kitchen or on the table. But in order to do so they must obtain the germs from some source, and this source is not the garbage pile. Therefore, in his opinion, it is the source of the germs which should be looked after by the Health Department and not the breeding of flies. Consequently, garbage disposal is in his opinion a matter of municipal housekeeping rather than of public health; and improper methods of dealing with garbage should be dealt with by the police department as public nuisances rather than by the Health Department.

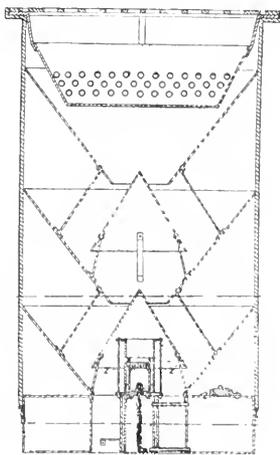

Concerning the danger from sewer gas Professor Jordan said: "If the most recent and searching investigations, such as those of Winslow and others, are to be believed, the actual peril to health involved in the entrance of small quantities of sewer air into houses is so small as to be practically negligible. It may be questioned whether plumbing inspection, as ordinarily admitted, can be shown to have saved a single life or prevented a single case of disease. . . . It might reasonably be maintained that slightly leaky gas fixtures are a much more serious menace to the health of house dwellers than is defective plumbing."

Professor Jordan does not deny that there is a certain amount of value in plumbing inspections nor that it is necessary that garbage be removed and prevented from creating a nuisance; but he maintains that money devoted for health purposes can secure much more adequate returns if used in other ways. Among these he refers at length to safeguarding the milk supply. Now that the public is aroused to the importance of pure water for preventing typhoid, he believes that milk is responsible for much more disease than is the water supply, and he appeals for a more general and adequate control of the milk from and including the milking of the cows to its final distribution to the consumers, recommending general pasteurization where other methods of securing safety are impossible or impracticable. He also strongly urges a more complete and accurate collection and recording of vital statistics, since through these can be learned the efficiency of the methods being employed and in what direction there is the greatest need for further or new endeavors.

DEODORIZING SEWER GAS

While fortunately the majority of American cities do not seem to be troubled with sewer gas, as are so many English cities, there is occasionally one on this side of the ocean which, on account of poor construction or lack of proper maintenance, finds it necessary to adopt some method of diminishing the nuisance from such gas. Among these is the city of Winnipeg, which has been troubled with this question for many years. The latter part of last year a test was made of the Beeman deodorizing machine, ten of these being placed in sewer manholes, where they were operated for three months.

The machine consists of a reservoir containing wood alcohol, the fumes from which impinge upon a disk of platinized porcelain 1½ inches in diameter. This disk, when heated cherry red, remains incandescent so long as the alcohol fumes are supplied to it, which fumes are changed into formaldehyde during their passage over the disk. In addition to the reservoir and disk there are a series of baffles and protectors through which both the formaldehyde and the air from the sewers must pass and which insure a thorough mixing of the two. The whole machine measures about 20 inches in diameter and 40 inches high and is suspended within an air-shaft from the sewer or in the sewer manhole. In the machines used in Winnipeg it was found that one gallon of wood alcohol, costing 62½ cents, lasted nine days. It is suggested that it would not be necessary to place such an appliance in each manhole, but that if one were placed, say, in every fifth manhole the openings in the other four could be closed. City Engineer Ruttan reported that sufficient formaldehyde was produced to deodorize the sewer air that emerged from the manholes. The city of Winnipeg has recently contracted for 50 of these deodorizers at \$75 each.

SEWER CONSTRUCTION IN ST. LOUIS

Large Brick and Concrete Sewers in Tunnel Through Rock and Sand, and in Open Cut—Using Shield and Air Pressure—Eight Miles of Sewer Under Internal Pressure—Tumbling Basin in Tunnel

AMONG the eighteen sewer contracts awarded in St. Louis last year, aggregating \$3,175,000, are several pieces of rather unusual or important work. The River des Peres foul water sewer, two sections of which have cost nearly \$1,000,000, is being constructed for nearly a mile through solid rock in a tunnel, and a third of a mile through a quicksand tunnel. Other large sewers are the Baden public sewer, 23 feet in diameter, and the Harlem creek public sewer, 29 feet in diameter, just completed.

The work laid out by the department for the coming year, while not as costly as that contracted for in the closing year, is more extensive, comprising 26 contracts, aggregating \$2,260,000; while if we add that which is to be started during the next year the total estimate is \$5,435,000. This sum is about one-fourth of the total expenditure for all sewer purposes in the city up to date. Up to a year ago the city had spent \$16,810,593 for the construction, repair and maintenance of sewers. At that time there was 661.61 miles of sewers in the city, divided as follows: Public sewer, 488,193 feet; joint district sewer, 29,481 feet, and district sewer, 2,975,661 feet. The total mileage at the present time is near 700, and the expenditure has probably been raised to nearly \$19,000,000.

The sewers are divided into three classes, one known as public sewers, which are paid for by the city as a whole from public funds by bond issue; another, joint district sewers, paid for jointly by the city and by the property owners in the drainage area effected, and the third, comprising all of the branch sewers and everything but the mains, called district sewers, are paid for by assessment against benefited property.

Of the work now under construction more than 56,000 feet, to cost \$1,640,223, is public sewer; 30,000 feet to cost \$800,166, is joint district sewer, and \$482,879 is the estimated cost of the district sewers. Public sewer for which contracts are soon to be awarded aggregate \$772,000; joint district, \$675,000, and district sewers, \$817,000, estimated cost.

Nearly all of the large sewers have been constructed of reinforced concrete. Not including the sewer constructed last year or that now under contract there is 4,487 feet of concrete sewer. Stone and brick sewer aggregates 74,136 feet, and brick aggregates 1,369,155 feet. There is 2,045,557 feet of pipe sewer, all of small size.

The largest sewer in the city is the Harlem creek main sewer, which is of concrete, 29 feet across and arched to 18.5 feet high at the center. This sewer is 1,016 feet long and is fed by a section 2,100 feet long of 16.3 x 25-foot sewer, besides the smaller sewers that lead into it; and two large branch sewers, North Harlem and South Harlem, connect into it.

The Glaise creek, a 12 foot 6 inch concrete sewer, 3,320 feet long, carries all of Glaise creek and the storm water of its drainage area. Additional sections of this sewer are planned, to cost \$80,000. Baden public sewer (a combined sewer) is the next largest after Harlem, being 23 feet across and of similar construction, the total estimated cost of which is \$876,527.

The River des Peres sewer is the longest yet undertaken; including three sections, 11,563 feet long, in Forest Park known as the Forest Park foul water sewer, it is to be nearly 48,000 feet long. Two sections of 9, 7 and 6-foot sewer extend from the Mississippi river toward the park, a total of 32,600 feet. All of this sewer is of brick. The contract cost so far has been \$987,116, and the other section is estimated at \$283,000, making a total of \$1,270,116. It was planned to tunnel through Forest Park hill, but the Municipal Assembly has refused so far to authorize an election to issue bonds, voting the proposition down

a few weeks ago. It will be necessary to either tunnel through the hill, about a mile, or parallel the river around it, about three or four miles, and it has been estimated by the sewer department that the tunnel would be much the cheaper.

It is also planned to reconstruct as a 7-foot sewer the Ferry street sewer, a 6-foot brick sewer which has failed. The Rocky branch sewer, now 12 x 15 feet, is overtaxed, and an auxiliary sewer is to be constructed parallel to it in the next street, ranging from 7 to 9 feet. This is estimated to cost about \$265,000.

RIVER DES PERES SEWER

The River des Peres sewer is the most unusual in some ways that has been undertaken in St. Louis. It is a 9-foot vitrified brick sewer, intended to carry the surface and house drainage from an area of 110 square miles.

At the outlet into the Mississippi River the sewer is carried 14 feet below mean low water, and extends back on a 0.1 per cent grade, so that 14,000 feet will be below low water level in the river. It is estimated that 44,000 feet will at times be under a head, and this length has been constructed accordingly, manholes as well as sewer being adapted to receive pressure. The last pressure manhole is distant from the outlet 26,500 feet, and this distance is calculated to be great enough to build up a sufficient head to overcome the back pressure of the river at all ordinary times. There is no opening of any kind into the sewer between this and 44,000 feet from the river.

No provision is made for a stage of the river higher than danger point, or 33 feet on the gauge, the reason given being that the river never will be above 33 feet for longer than three or four days at a time and at such long intervals as not to warrant the cost of providing for it. The flow line at the outlet is 8 feet below zero on the gauge, making danger point 41 feet above the outlet.

For about 16 miles the River des Peres winds through a low, swampy section just inside the city limits and empties into the Mississippi river just inside the limits at Catalan street. The first three sections of the sewer, about 8 miles in length, will replace 12 miles of river by making short-cuts across "necks" of the river. Besides about 26 square miles of drainage area around the southwest border of the city, inside the city limits, various branches drain about 84 square miles of St. Louis county, outside the city limits. This sewer is designed to carry all the sewage from this area after it is built up, but only sewage, and the open channel of the river will remain undisturbed. Many sewers discharge into the des Peres sewer, including the 12 foot 6 inch Glaise creek sewer. This latter carries Glaise creek in addition to house drainage, but only the latter will go into the des Peres sewer, the overflow of storm water going into the open des Peres river. The same applies with all other district sewers connecting with the des Peres sewer, except one, which is admitted 800 feet from the river in a tumbling basin, the full storm water flow of which will be provided for.

Provision is made for flushing the pressure sewer with water from the River des Peres when the flow is otherwise insufficient. This is accomplished by means of a check valve in a line connecting the sewer with the river. The latter has a minimum flow of 23 cubic feet a second, and when the amount of sewage passing through the sewer does not produce a pressure greater than the pressure of the river water against the valve the latter will open and allow river water to enter the sewer.

The city boundary line makes a gradual curve through an angle of about 40 degrees, and the river approximately follows this curve. The sewer is to follow the river valley, cutting off most of the sharp bends. It starts at the Mississippi river with

a short outfall section, extending for 214 feet into the river. This section has not been started yet, the contractor choosing to wait for a low stage of the river, next fall. The work, of course, will have to be done in a cofferdam, and the expense of such a dam at high water stage of the river would be very great. This part of the sewer and about 500 feet of the tunnel work beyond is to be on an 8 degree curve, bringing the outlet well out in the river and discharging in the direction of the river flow. This is expected to produce a suction and aid the discharge.

The sewer is now under construction in two sections or contracts, one a tunnel section 6,700 feet long, and the other an open cut section of about five miles. The contractors decided to do part of the tunnel section in an open cut and part of the open cut in tunnel work. In the first section three crews are being used, and the contractor on the second section has eight crews at work.

On the first section work was started first in a shaft 980 feet from the edge of the river or about 1100 feet from the gate at the end of the outfall. Another shaft was put down 2,500 feet from the first. Both tunnel crews worked toward the river to the east. The first has finished its work, stopping the tunnel when all but 6 feet of the rock separating the tunnel from the river had been drilled. The second crew, after going 1300 feet toward the first shaft, struck running sand, which lies between two hills and which is to be worked from the first shaft with a circular shield. Both of these rock tunnels are now being lined.

Work started about the middle of April in the running sand tunnel, worked from the first shaft, and about 100 feet (mostly "nigger head" boulders, gravel and coarse river sand) has now been finished and lined.

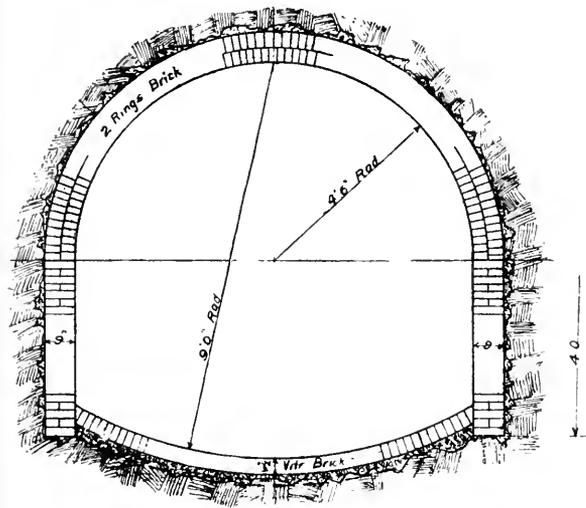

All of the sewer except the running sand tunnel section is

horseshoe shape, constructed of brick. The invert is laid on solid limestone, evened up with concrete. The side walls for a height of 3 feet are 8 inches thick. The upper half is a circular arc, constructed on a center and keyed. The center is of wood, 16 feet long, and consists of four semi-circular ribs well braced. Loose lagging is laid on the ribs as the lining is brought up in horizontal courses from the spring line, and the key course is put in with block lagging in short lengths. All spaces between brick work and rock are filled with concrete.

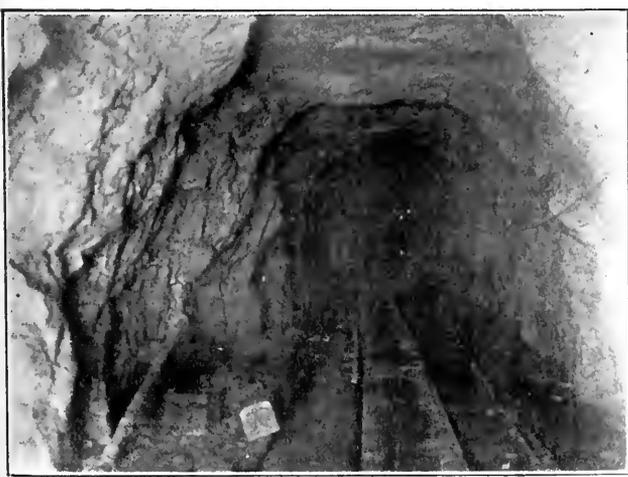

The lining is laid in Portland cement mortar. All joints are "shoved." The invert and bench walls are built in the morning of each day, the arches in the afternoon and the keying course by the night shift. The longest time the lining stands before the centers are removed is five or six hours after the key course is finished; but since there is no pressure on the lining, barring the concrete filling which is put behind to fill between the lining and the stone, this has proved ample.

Materials, both those for use in construction and that which is excavated, are handled on cars which run on tracks laid in the tunnel. Lifts (cages) raise the cars up the shaft to the surface, where other tracks lead to the dumps and material house.

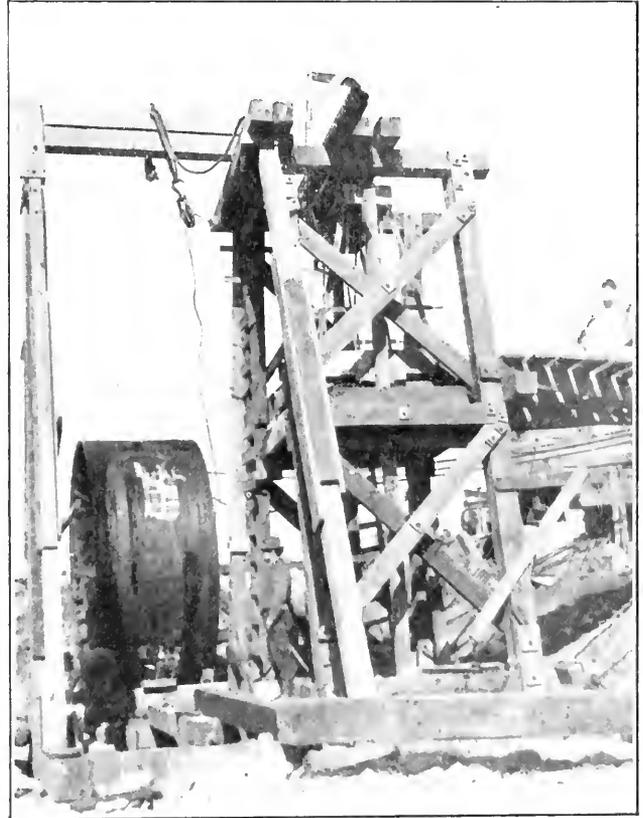

The tunneling is through a good grade of limestone, with a considerable number of mud seams, which are filled with a 1:3:5 concrete mixture. The formation of the rock and earth seems to indicate that at some ancient time the course of the river was along that part of the sewer where the running sand tunnel is, about 1,200 feet from its present channel. Excavation is a little different from ordinary, the whole bore being blasted as a heading, instead of in bench work. Drilling is done in day time and the mucking crew works at night. Smoke and bad air are expelled by opening the cocks on the compressed air line. Compressed air is used for drilling in both the tunnels, and will be used in the working chamber of the quicksand tunnel if it becomes necessary. The air compressor is an Ingersoll-Rand, providing 1,160 cubic feet of free air per minute at 85 pounds pressure. The receiver has about 500 cubic feet capacity and is located just outside the power station. This station is located just off the line of the sewer, midway between the two shafts.

TUNNEL IN COHESIVE GROUND, RIVER DES PERES SEWER

ROCK TUNNEL, RIVER DES PERES SEWER

SIDE VIEW OF SHIELD Hood and tail are not attached.

REAR VIEW OF SHIELD.

The running sand tunnel, as stated, is the only section of the sewer which is not horseshoe shape. It was made 9-foot circular, as this shape is stronger and much less expensive to construct.

It is being constructed with a steel shield, 13 feet 4 inches outside measurement. The shield is circular, and has two skin plates, $\frac{5}{8}$ inch thick, bolted together the full length (6 feet) of the main shield chamber. One of these plates extends back 4 feet to form the tail and to hold the walls of the tunnel until the lining can be put in. There are two diaphragms, one connected to the cutting edge castings, against which the jacks work, and one to the rear framework of the shield, which supports the circular walls. Sixteen powerful hydraulic jacks, each rated to give 5,000 pounds to the square inch, but tested for 16,000 pounds, rest in the diaphragms. The jacks have a 6-inch plunger and a 30-inch stroke. Two doors of $\frac{5}{8}$ -inch plate steel are provided at the rear of the 6-foot shield to be closed in an emergency, such as the failing of air or a sand run.

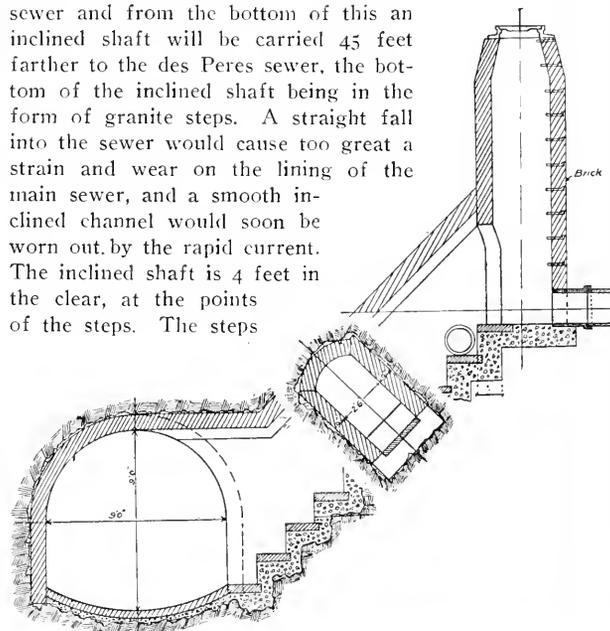

To take the thrust of the jacks when pushing the shield forward, a wood circle is being put in. This is made up of sixteen 30-inch arcs, each cut circular, 6 inches thick and 10 inches wide. One of these cants is put in at a time without removing more than one jack. Under any pressure that has been encountered so far four jacks will propel the shield, but if big boulders or hard formation is struck, the whole sixteen jacks could be used and each could exert its full strength of 16,000 pounds, or a total of more than 100 tons pressure. Similar shields have been used with the jacks working directly against the brick lining, but the wood circle, a fairly good sewer in itself, furnishes a support for the jacks while the brick circle lining is being brought up. The sand closes in and tightens the circle of wood as soon as the tail of the shield moves forward. The wood circle allows half an inch all around for the 18-inch brick lining. This half-inch space is filled with cement mortar, making a close union between the wood and the permanent lining.

After finishing the limestone tunnel east from the second shaft to the running sand, the crew working from the second shaft turned to the west and is now completing a short stretch of 200 feet to connect with the open cut. A third crew has laid a considerable stretch of sewer in open cut westward from the hill.

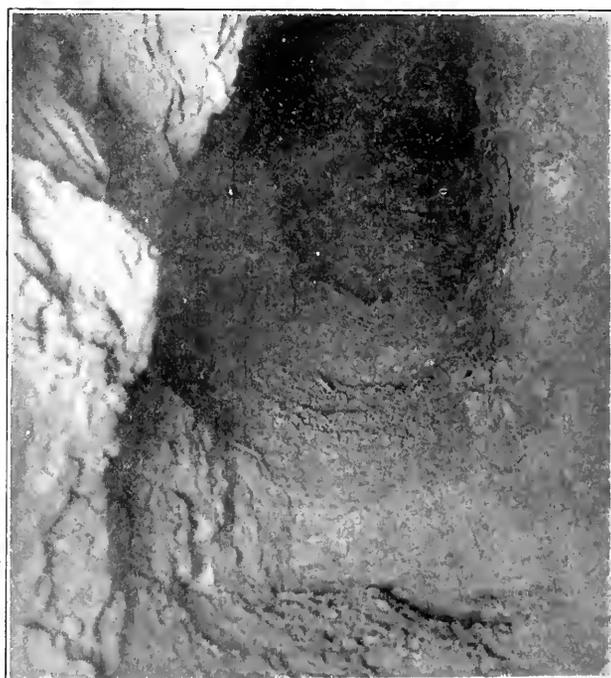

A gate and clean-out shaft, provided for any possible future emergency, is located at the beginning of the open cut, about 4,000 feet from the river, and allows admission to the tunnel without expensive excavation. As the sewer is below low water in the river, another gate will be necessary at the outlet. When both gates are closed this section can be pumped out, permitting any repair or other work.

The gate works perpendicularly in the clean-out shaft and will be nearly balanced with counter weights weighing 3,500 pounds. A windlass will be provided for lifting it. The clean-out shaft is a little over 9 feet across, and is 5 feet 3 inches wide in the direction of the sewer. The total height of the shaft is 38 feet, of which about 8 feet is above the ground. The gate proper is constructed entirely of iron. Two 10-inch I-beams and two 10-inch channels, all vertical, connected by five 5-inch I-beams form the frame work, on which is riveted a $\frac{5}{8}$ -inch iron plate. This gate weighs about 4500 pounds. It slides in grooves built at the west side of the shaft (that farthest from the river) and rises high enough to be entirely clear of the 9-foot sewer. The fit is made as tight as is practicable. When closed the gate can be forced against the seat by long wedges driven into the grooves.

A district sewer is to be connected with the main des Peres sewer through a "tumbling basin" about 800 feet from the river. A vertical manhole 24 feet deep will be built on the district sewer and from the bottom of this an inclined shaft will be carried 45 feet farther to the des Peres sewer, the bottom of the inclined shaft being in the form of granite steps. A straight fall into the sewer would cause too great a strain and wear on the lining of the main sewer, and a smooth inclined channel would soon be worn out by the rapid current. The inclined shaft is 4 feet in the clear, at the points of the steps. The steps

TUMBLING BASIN—LONGITUDINAL AND CROSS-SECTION.

LOOKING UP INTO TUMBLING BASIN, BEFORE PLACING LINING AND STEPS.

have a 20-inch tread and 30-inch rise, the treads being of granite to prevent wear.

Drop manholes on the pressure sewer are provided with a check valve on each branch pipe (the last few feet of which are of iron) opening toward the main sewer. This is intended to prevent the water from backing up into the branch during high water.

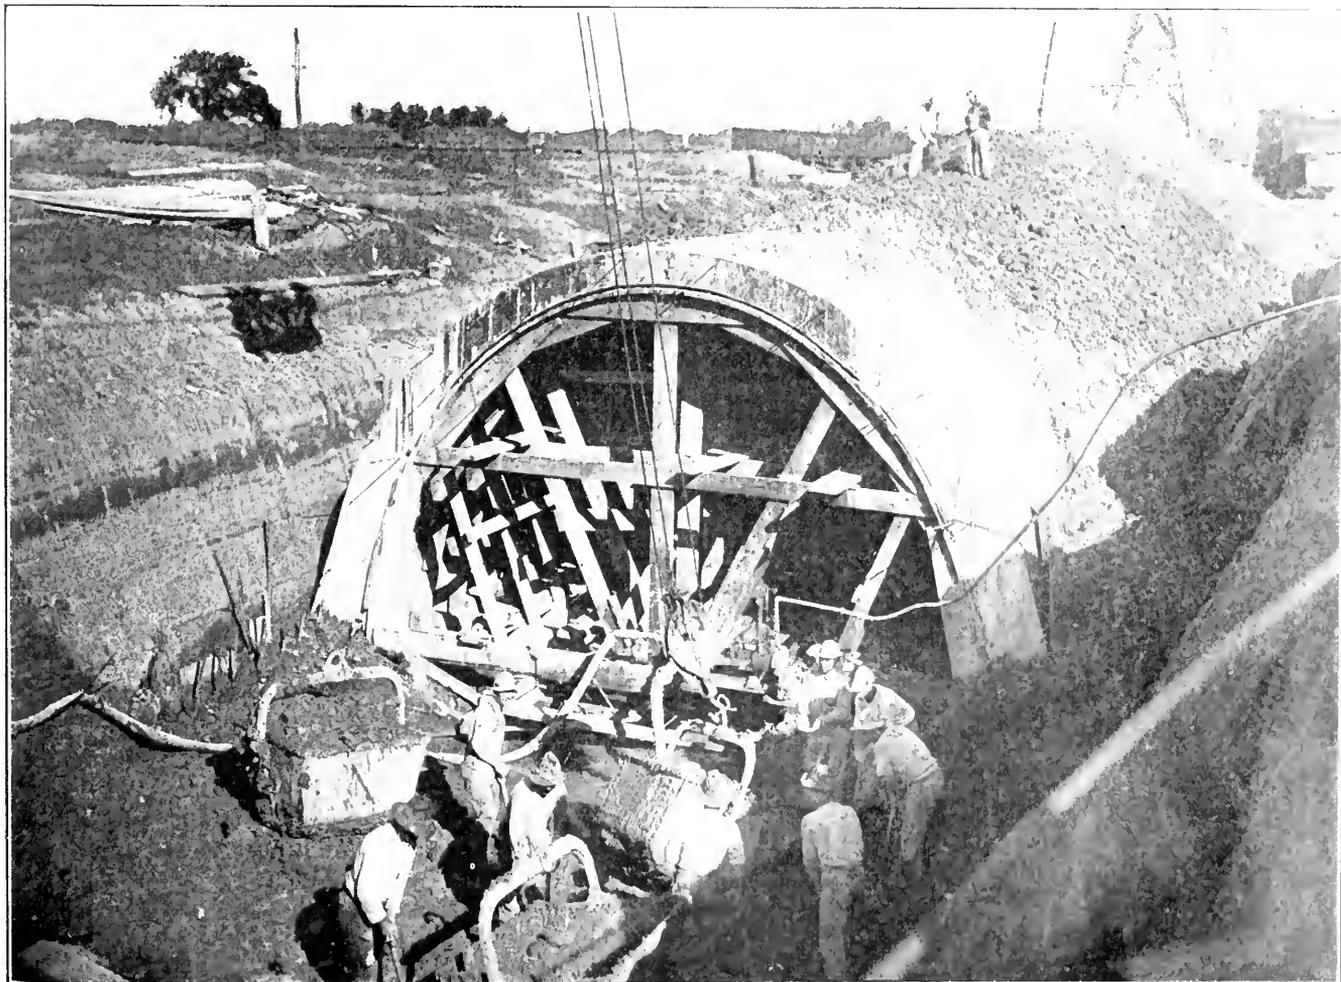

In other drop manholes vertical lines of vitrified pipe are fastened by iron straps to the inside walls, and are provided with an elbow at the bottom to throw the outflow into the current of the main sewer and protect the latter from wear.

The second or open cut section of the des Peres sewer is about five miles long and includes all of the 7-foot and the 6-foot portions. This section is now being worked from eight points, and in almost as many different ways. Two cranes, three Potter trench machines, one cableway (at a creek crossing) and a steam shovel are being used on different parts of the job. In addition, one 600-foot stretch is being worked in a tunnel, although it had been planned as open cut work, but as it is through a hill the contractor thought he could construct it to better advantage as a tunnel. Many cave-ins, however, have made the work so difficult and so expensive that it has probably cost the contractor much more than he will get out of it.

This whole second section has proven more difficult than the tunnel. Many expensive accidents have been encountered, one of the first being in open cut where the material was handled by a crane. This crew struck a number of pockets of running sand about 5 feet thick overlying the rock, which latter had to be blasted, and the blasting tended to tear out the sheeting of the trench above. For a portion of the distance it was necessary to construct cross bulkheads ahead of the work above the rock to hold the running sand. Tongued and grooved flooring lumber was used for sheeting and bulkheads.

The shaft for the tunnel section caved in three times during construction and but 10 feet of the tunnel had been completed at the end of four months. The first cave-in occurred when the shaft, constructed 10 foot square, was almost down to the flow line. It was reconstructed 10 by 20 feet, but a quicksand pocket caused it to cave again before it was completed. The third attempt, making the shaft 10 by 27 feet, was successful. The tunnel, which is from 45 to 60 foot below the surface, is entirely in sand, gravel and other loose material. A peculiar formation closely resembling macadam or crushed rock was found in this tunnel, and in some of the open cut work, imbedded in tough gumbo. It ran in layers about 8 feet thick. In March of this year the tunnel caved in 115 feet west of the shaft, the hole extending entirely to the surface, 49 feet above. The tunnel was worked both ways from the shaft, the day crew excavating about 8 feet and bracing it up for the bricklayers at night. No attempt was made to hold the excavation longer than one day. The 600 feet is now about completed, after seven months' work.

As stated, the sewer follows more or less closely the valley of the river, and much of it is in the river bed. Ground water, of course, interfered to a great extent with the work on the whole sewer because of its being below the low water line of the river, but only in quantities which could easily be handled by pumps. In the short stretches constructed in the river's bed, however, not only the ground water, but the river itself had to be contended with. The ground, particularly along the river banks in the swampy bottoms, is of a treacherous nature, and it was very difficult to hold the banks of the excavation. Early in April the river broke through a flume constructed to carry it across the trench, and this stopped the work of the whole crew for several days. The sewer at this point had been almost finished when the mud fill around the flume washed out

END VIEW OF 23-FOOT BADEN SEWER

WHERE RIVER BROKE INTO TRENCH.

and the trench filled with water. Steel sheet piling had been used to hold the banks and the sewer was being laid as fast as the trench was ready and back filled with the excavation from in front. An effort was made to divert the river around the break, over the end of the completed and covered sewer, by drawing the piling at this point; but this was not successful and it was found necessary to practically construct a puddle cofferdam to finish the remaining 40 feet of sewer in the river bed.

Special construction is used in the sewer which lies in the river bed to afford additional strength against the internal pressure should the filling over the sewer be washed away by the river. After the first ring of brick is laid in the invert it is covered with expanded metal in sheets 5 by 28 feet and this reinforcement is carried up over the arch. Two more rings of

brick are laid on this and these two inner rings are carried over the entire arch. Concrete is filled in between the brick arch and the sheeting for 2 or 3 feet above the spring line, making a thick shoulder, and is carried over the outside of the arch about 4 inches thick on top of the reinforcement.

BADEN SEWER.

The Baden sewer, the largest work now under construction, starts from the Mississippi River at the mouth of Gingrass Creek and Moline Creek, two wild little streams which enter the river together. The public sewer is nearly a mile long, ranging in diameter from 18 feet to 38 feet, the latter size being an open channel with vertical sides, 388 feet long, at the outlet into the river. The largest part of the closed sewer is 23 feet wide by 18 feet 6 inches high.

The open section of the sewer is constructed in a 54-foot trench, and has been the most difficult part of the work. It has been completed, as has also about 1,250 feet of the 23-foot closed section. The bed of the combined streams runs along the right of way chosen for the sewer, and the ground was, of course, very wet and hard to hold. Although a considerable part of the finished sewer at this point is above ground, steel sheet-piling was used, driven down to solid rock where the sewer was near the river channel, the piling being needed to hold the banks and prevent washing. Back from the river bank a hundred feet or so the piling did not need to go entirely to rock.

It was found necessary torevet the river bank at the sewer outlet with rip-rap for about two hundred feet to protect the end of the sewer against washing. This connects the revetment made by the government and by the Burlington railroad at the north and south of the sewer outlet.

At the end of the open sewer, just before it connects with the first section of the closed sewer, special provision had to be made for getting under the railroad tracks of the Burlington

COLLAPSE OF SHEETING, 29-FOOT HARLEM CREEK SEWER
Steam Shovel Protected from Earth by Steel Sheeting.

main line, which crossed the double creek on a long wooden trestle. The concrete sewer walls on either side of the tracks are continued to 18 ft. 6 ins. high to act as retaining walls and are strengthened by buttresses 6 feet 3 inches wide at the base and 15 inches to 2 feet thick. Along the top of the retaining walls, which is 15 inches thick, is a reinforced concrete coping 2 x 2½ feet wide. Under the line of the tracks a third wall is built in mid-channel of the sewer, and on these three walls the railroad company purposes to lay concrete slabs 2 feet 9 inches thick, meeting on the middle wall. It also intends to fill in its trestle, when the embankment will form a levee to hold back the two rivers and force them to enter the sewer. A 40-foot opening has been left in the north side of the sewer to admit Moline Creek. On the south side only a two-foot vertical gap was left, Gingrass Creek being turned into the sewer one-fourth mile from the river. This two-foot gap is to admit the storm water which will collect back of the embankment.

The bottom of the open sewer is vitrified brick four inches thick on a 30-inch reinforced concrete base. The first section of the closed sewer is 23 feet wide and 16 feet 9 inches high, with the arch a flat ellipse and the bottom slightly concave. The bottom is constructed similar to that of the open sewer, while the arch is of concrete, 13 inches thick at the crown and 30 inches at the spring line, and reinforced with one-inch round bars one foot apart, making the full curve in one piece, and half-inch bars running lengthwise of the sewer. This section is 2,680 feet long, and has a fall of 0.2 of one per cent.

At 3,150 feet from the river, where the sewer passes under a stone arched bridge carrying the water works conduit, the diameter of the sewer is reduced to 18 feet, which size is continued for 1,440 feet. All of the work in these three sections is contracted to the Hoffman and Hogan Construction Company for \$280,157.15.

From the end of this third section the sewer continues for 4,400 feet with a diameter of 14 feet. This was let to the Wm. F. Reilly Construction Company for \$162,015.80, making the total cost of the public sewer \$442,172.95. Several miles of district sewers to drain the Gingrass water shed, contracted for by the Fruin and Colnon Construction Company, will cost \$434,354.64 more, paid mostly by property owners in the district. This makes the entire project cost over \$875,000.

OTHER SEWERS.

The recently completed Harlem Creek main sewer offered several difficult problems for the contractor. A heavy cut through the edge of a hill resulted in several slides which buried the machinery. The depth of the trench was a little over 50 feet on the hill side of the cut, and a small ravine running through the toe of the hill, together with many layers of saturated clay, made the job very difficult. The excavation was at first made without sheeting, by sloping the banks, but the slope had to extend so far up the hill that it promised to be very expensive, and the contractor thought to save money by using sheet piling. The latter failed to hold the embankment, however, and was crushed in on the machinery by slides, so the contractor went back to slopes, increasing their length, but many cave-ins continued to add greatly to the expense.

The Forest Park sewer, already mentioned as a part of the River des Peres sewer plans, cannot yet be put to its ultimate use, but is being used for a temporary purpose. From its great drainage area the river has collected much sewage and has become an open sewer. Complaint by resident property owners made it necessary last summer to turn large quantities of water into the river from the city water mains, to give it an occasional washing out in dry weather. A temporary electrical pumping plant has been provided to lift the sewage from this Forest Park sewer into an old five-foot sewer, pumping foul water from the river when it is low enough to be polluted by the sewage. Except in the dry months, the flow of water in the river is expected to be sufficient to so dilute the sewage as to prevent a nuisance. When the balance of the River des Peres sewer is completed, the pumping station will be abandoned. The contract cost of the station was \$4,776.

These sewers were designed by Assistant Sewer Commissioner James A. Hooke, under the direction of Sewer Commissioner

Harry R. Fardwell, and with the assistance of the Department Engineer Walter T. Gray. Mr. Gray, who was particularly interested in the planning of the River des Peres sewer, is now Engineer of Construction on the first, or tunnel, section.

CATCH BASINS IN NEWPORT

The street commissioner of Newport, R. I., J. K. Sullivan, in his report for 1909 stated that 587 catch basins—the average number in use during the year—were cleaned a total of 1,583 times; that is each basin was cleaned an average of nearly three times during the year. There were removed from them 1,525 loads of material. The total cost was \$3,253.30, or \$2.06 per cleaning.

Three cleanings per year does not seem to be a very high average, and yet it is very much higher than is found in many and perhaps most cities; the average in Chicago, for instance, being about one-third of a cleaning per year. The number of cleanings which a given basin should receive depends, of course, upon local conditions. Some basins should be cleaned after every storm of any severity, say at least eight or ten times a year; other basins never require cleaning, never receive it and were therefore a waste of money in the first place and worse than useless throughout their existence. It is probable that a number of the Newport basins receive more than three cleanings a year, this being the average of all the basins. And yet it would appear that certain of them should have been cleaned much more frequently, since we find under the statement concerning the cleaning of sewers that 91 tons of gravel were taken from the sewers during the year and used for various purposes by the street and sewer department, yielding a net saving to the department of \$62.79. At points where such quantities of gravel as this are washed into the sewers it would seem as though special basins of unusual size are required. And if the department really makes a net gain by removing gravel from the sewers the greater gain permitted by the cheaper removal from a basin might in a short time suffice to repay the cost of the basin.

ASSOCIATION OF GEORGIA HEALTH BOARDS

At the invitation of the State Board of Health of Georgia there recently convened at Rome, Ga., representatives from many of the cities and counties of the State for the purpose of combining in an effort to improve sanitary conditions throughout the State. An organization was formed which has taken the title of the "Association of State, County and Municipal Health Boards." The officers elected were Dr. J. C. Bloomfield, of Athens, president; Dr. C. M. Weaver, of Macon, vice-president; Alfred V. Wood, of Brunswick, secretary. Meetings of the association will be held on the day preceding the meetings of the State Medical Association. Through its own publications and the use of the public press of the State, the association hopes to exert an influence toward securing the enactment of better health laws and a more effective carrying out of the same.

BOARD OF HEALTH REPORTS

Beginning in the latter part of 1909 the Board of Health of Cincinnati, Ohio, was reorganized, and the first difficulty it encountered was the absence of adequate records or system of collecting them. Experience in New York indicates that there are about three times as many cases of tuberculosis as deaths, and it has been generally found that the cases of typhoid fever average ten times as many as the deaths; but such returns as had been made by the Cincinnati physicians gave a less number of cases than of deaths from such diseases; the reports of tuberculosis cases for the first eight years of the century averaging two or three hundred per year less than the deaths. This condition is being remedied, and any physician who is now found reporting a death from tuberculosis, typhoid, etc., without having previously reported the case when alive is called upon for an explanation.

SEWERAGE STATISTICS OF AMERICAN CITIES

Reports for the Year 1910 from Sixty Large Cities—Furnished Especially for This Table by Officials in Charge—Sewerage Systems—Pumping and Purifying Sewage—Sewer Assessments

Of the 8,428.65 miles of sewers in the cities reporting, 6,385 are combined sewers, and the remainder are on the separate system, 1,250 being for house sewage and 331 for storm water only. (The remaining mileage was unclassified by the informant.) Of the total amount, 5,627 miles are vitrified pipe and 1,808 are brick sewers. Of the remaining 1,000 miles nearly 500 is under the head of "not designated," the majority of which is probably vitrified pipe. Aside from vitrified pipe and brick, the greatest mileage among house sewers is of plain concrete built in place, while combined brick and concrete, cement pipe, reinforced concrete pipe and iron pipe each amounts to two or three miles. Among the combined sewers cement pipe and combination brick and concrete sewers are nearly tied for third place, following which come plain concrete, reinforced concrete built in place, a combination of brick and stone, and stone sewers, in the order named. Among the storm sewers the amount of stone sewer slightly exceeds that of brick, following which come plain concrete, a combination of brick and concrete, reinforced concrete built in place, cement pipe, a combination of brick and stone and reinforced concrete pipe, in the order named.

A great many of these sewers were built several years ago, and a comparison of the relative amounts of each class in this table and those of the sewers built during the last fiscal year would indicate the change in popularity of the several materials; part of this change being probably due to the change in the system as a whole and in the sizes of sewers built, rather than in the materials adopted for given sizes.

SEWERS BUILT DURING 1910.

During the year 1910, or the fiscal year ending during 1910, there was built in the fifty odd cities included in our table 421 miles of sewers. Of these about 117 miles were for house sewage only, and 286 miles were combined sewers, while only 18 miles were for surface water only. All but six of the cities tabulated have a population of more than 25,000. Had a larger percentage of small cities been included, it is probable that the proportion of house sewers to combined sewers would have been much greater, since combined sewers are not so frequently built at the present time in the small cities as is the practice in the larger ones.

The predominance of vitrified pipe sewers in recent construction appears quite strikingly in this table. Of the house sewers 110 miles were built of vitrified pipe, 0.1 of a mile of cement pipe, 3 miles of reinforced concrete pipe, and 1½ miles were built of brick and one mile of plain concrete, these probably being the larger sizes. Even in the combined systems more than one-half of the construction was of vitrified pipe, one-fifth was built of plain concrete and a little less of brick. Of the surface water sewers over one-half were vitrified pipe, about one-sixth were brick, and there was less than one mile each of stone, plain concrete, reinforced concrete, cement pipe and reinforced concrete pipe.

Twelve of the cities did all of their sewer construction by day's labor, nine of these being in New England. Several others did a part—generally a small part—of last year's construction in this way; but the great majority of the work throughout the country was done by contract.

AREA SERVED BY SEWERS

The proportionate amount of the total city area which is served by the sewer system will naturally depend to a large extent upon the amount of sparsely settled area which has been included within the city limits. For instance, that portion of New York City known as the Bronx has extended its sewer system into only about 25 per cent of its area. Two cities re-

port that all of the city area is sewered. Six cities report about three-fourths the area sewered; nine report between two-thirds and three-fourths of the area sewered; thirteen between one-half and two-thirds, eight between one-fourth and one-half, and three less than one-fourth of the area.

HOUSE CONNECTIONS

The majority of the cities use 6-inch house connections only, although quite a number use 4 and others report 8, 9, 10 and even 12-inch connections; although it seems probable that these largest must be for institutions or factories. One peculiarity noticed is that 5-inch connections are used by five New England cities and by only two cities outside of New England. Of 55 cities reporting the sizes used, 25 use 6-inch exclusively, and 19 others use 6-inch and other sizes as well.

It will doubtless surprise some to learn how large a percentage of houses are not connected to the sewers, even in the largest cities. For instance, Chicago contains about 10,000 houses not connected with the sewers and Terre Haute about the same number, or more than three times as many as are connected. A great many of the cities do not report the number of houses not connected, probably because no record has ever been taken of them. An inspection of the table, however, shows that in quite a number of cities only about one-half of the houses are sewered, and only one city, Newark, N. J., reports every house connected with the sewers. Incidentally, it may be said that in the city of New York (complete reports for which do not seem to be available yet) there are a great many thousand houses for which no sewers are provided, some of these in the well-built-up sections of Brooklyn. Most of them, however, are in the outlying sections of the several boroughs other than Manhattan.

Of the cities reporting, about one-third do not use main traps on the house connections. These cities seem to be pretty well scattered over the country, three of them being in New England and three of them in the Middle Atlantic States, while others are found in Colorado, Arkansas and West Virginia. In addition to the fourteen which report that main traps are not used, one reports them as "sometimes" used, another "very seldom," and still another states that their use is optional. Twenty-nine report that main traps *are* used on the house connections.

HOUSE CONNECTIONS MADE BY WHOM?

In Hartford, Conn., Wilmington, Del.; Springfield, Mass.; Trenton, N. J.; Binghamton, N. Y.; Watertown, N. Y., and Reading, Pa., connections are laid to the curb line by the city and from there on by the property owner. Connections are put in by the city in Rockford and Springfield, Ill.; New Bedford, Newton and North Adams, Mass.; Newark, O., and Erie, Pa. They are put in by the property owner in Little Rock, Ark., Pueblo, Col.; Meriden and New Haven, Conn.; Chicago and Joliet, Ill.; Terre Haute, Ind.; Cedar Rapids and Sioux City, Ia.; Wichita, Kan.; Bangor and Portland, Me.; Haverhill, Lawrence and Lowell, Mass.; Battle Creek, Grand Rapids and Muskegon, Mich.; Butte, Mont.; S. Omaha, Neb.; Elizabeth, N. J. Albany, Buffalo and New York City, N. Y.; Asheville, N. C.; Grand Forks, N. D.; Harrisburg, McKeesport, New Castle Wilkes-Barre, and Williamsport, Pa.; Providence and Woonsocket, R. I.; Aberdeen and Spokane, Wash. Cleveland, O., reports that the city puts in delinquent connections and Columbus, O., that the city makes connections on improved streets and licensed sewer builders on others. We presume that in these cases the cost of the house connection is charged to the property owner; and it seems quite probable that this is also the case in most instances where connections are made by city.

SURFACE WATER INLETS

The majority of the cities report concerning surface water inlets that all of these are provided with catch basins, but still there are a goodly number of cities which have a greater or less percentage of their inlets without catch basins. Wilmington, Del., has 1,700 inlets without catch basins and only 4 with them. Chicago, Ill., on the other hand, has 75,867 inlets with catch basins and none without. (Incidentally, most of Chicago's catch basins are never cleaned out, and so are worse than useless.) Altogether 18 cities report having inlets without catch basins, and 23 that all inlets have catch basins. Two report having no inlets with catch basins, although having a number without catch basins. Altogether the total number of inlets reported having catch basins is about 130,000, and the total without catch basins is about 6,000.

Concerning the cleaning of catch basins, the reports are quite interesting. The number of cleanings vary from practically none to cleaning each basin 100 times a year (twice a week). In the majority of cities, however, the number of cleanings varies from an average of one to six cleanings of each basin a year. In Hartford, Conn., each basin was cleaned an average of four times during the year, and each time there was removed a little less than $\frac{1}{2}$ cubic yard of material. In Chicago the average number of cleanings per basin was $\frac{1}{3}$, and the amount of material taken from each basin was about $1\frac{1}{2}$ yards. A number of cities report cleaning each basin once during the year. Newton, Mass., one of these, removed about 1.9 cubic yards at each cleaning. Buffalo, N. Y., cleaned each basin an average of nearly five times, but removed each time only about one cubic foot of material. In the Borough of the Bronx, New York City, each catch basin was cleaned an average of about twice, and each time there was removed about $2\frac{1}{2}$ cubic yards. In McKeesport, Pa., each basin was cleaned once a month, and $\frac{1}{2}$ a cubic yard removed each time. (The even numbers indicate that these figures were estimated.) In Wheeling, W. Va., each basin was cleaned about six times, and a little more than $\frac{1}{2}$ cubic yard removed each time. In Newark, N. J., each basin was cleaned on an average one and one-half times, and $\frac{3}{4}$ cubic yards was removed each time.

The ordinary method of cleaning is to use scoops and shovels. Pumps are reported used in Pueblo, Col.; New Bedford, Mass., and Battle Creek, Mich. Pails are used in Bangor, Me.; Chicago, Ill.; New Bedford, Mass.; Newton, Mass.; North Adams, Mass.; Butte, Mont.; Newark, N. J.; New York, McKeesport and Williamsport, Pa. In Providence, R. I., the material is removed in buckets by hand and dumped into steel carts.

In removing catch basin material two cities use iron carts similar to those employed in a number of places for collecting garbage. Two use dump carts, five use dump wagons, and one uses a "water wagon" and a pump. In two or three cities the material is removed from the catch basins to the street, and is collected and carted away by the street department. In two cities the catch basins are cleaned by contract with private parties.

PUMPING SEWAGE

Some details of sewage pumping plants were given by Chicago, Ill., Buffalo and Mt. Vernon, N. Y., Columbus, O., Reading, Pa. and Providence and Woonsocket, R. I. All of these report that the sewage receives no preliminary treatment before being pumped, other than coarse screening; except that at Columbus, O., the heavy detritus is removed and the sewage is passed through 1-inch and $\frac{1}{2}$ -inch bar screens before reaching the pumps. The amount of material so removed in Columbus is not determined. In Reading, about 31 cubic feet of material per million gallons pumped is removed before pumping; and in Providence, about one-tenth of a cubic yard per million gallons.

Centrifugal pumps are used for pumping in Chicago (several plants); in Buffalo, an 18-inch, a 24-inch and a 30-inch pump; in Mt. Vernon, two pumps; in Columbus, two 10-inch pumps, two 12-inch pumps and three 20-inch pumps; in Providence,

two 24-inch pumps and in Woonsocket, one 8-inch pump. The only other style reported is at Reading, where there are two duplex, compound, condensing plunger pumps which lift seven million gallons per 24 hours against a head of 35 feet. Steam is used for driving the pumps in Chicago, Buffalo, five of the seven in Columbus, those in Reading and in Providence. The Mt. Vernon pumps are driven by motors and two of the Columbus pumps by gas engines.

The lifts in the various cities are as follows: Buffalo, 15 feet; Mt. Vernon, 25 feet; Columbus, by gas engines 60 feet, and by steam engines 25 feet; Reading, 35 feet; Providence, 27 feet; Woonsocket, $20\frac{1}{2}$ feet. In Chicago about 3.2 per cent of the sewage is pumped; in Buffalo, 7 per cent; in Mt. Vernon, about 25 per cent; in Reading, 100 per cent; in Providence, about 95 per cent. In each of these cases pumping is necessary for draining certain low lying districts; although in Columbus a large part of the pumping is necessary during the high water only, and in Reading a large part of the lift is to produce the required head on the sewage disposal plant.

MISCELLANEOUS

It is somewhat surprising to note the number of cities which have inverted siphons in their pipe lines. Twenty-one cities so report, Hartford, Conn., having ten; Newton, Mass., five; Buffalo, N. Y., sixteen; Harrisburg, Pa., twelve. Twenty-five years ago considerable doubt was generally entertained as to the successful operation of these, but the number now in use would indicate that any difficulties of construction or maintenance have been met, and are no longer considered as serious. Twenty of the cities report having flush tanks, although a number report having only one. Six report having connections between the water mains and manholes for direct flushing of the sewers.

The data concerning flushing of sewers appear to be very scarce. Chicago reports flushing 625 miles of sewer by hand at a cost of a little under \$50 a mile. Lowell, Mass., flushed 2.2 miles of sewer by hand at a cost of \$121 a mile. Buffalo, N. Y., flushed one mile by hand at a cost of \$41, and Providence, R. I., flushed 20.7 miles by hand at a cost of about \$160 a mile.

In cleaning sewers most of the cities report flushing as one of the methods. Rods are used by ten cities; sewer-cleaning machines by five cities. A number use fire hose for washing the material down, the heavier matter probably being removed at the nearest manhole. Chains are used by some, steel buckets dragged from manhole to manhole, hoes and brushes. Cleaning sewers cost the various cities from \$66 to \$500 a mile, the figure in most cases running about \$200 to \$400 a mile.

Concerning ventilation, most of the cities report the use of perforated manhole covers, while a number include the house stacks or soil pipes as assisting or being the chief agent in this. A number which report that main traps are not used on house connections do not report that the house connections assist in ventilating the sewer, although it would seem probable, if not practically certain, that this is the case.

ASSESSMENT FOR SEWER CONSTRUCTION

State laws, city charters and local conditions, as well as diversified views, cause considerable variation in the methods of assessing for sewer construction. In Little Rock, Ark., the law requires sewers to be constructed by improvement districts, and the assessment is made by districts. In Pueblo, Colo., assessment is on the front foot basis. The same method is employed in Hartford, Conn., for local sewers, while for intercepting sewers an appropriation is made from the general tax fund, and storm water sewers are assessed upon the total watershed. In New Haven, Conn., as assessment is made of \$1.75 per front foot of abutting property; 75 feet on one street is exempted for corner lots and odd-shaped lots are adjusted by the Bureau of Compensation. In Wilmington, Del., there is an assessment of 50 cents per front foot plus one cent per square foot of area on lots abutting on the sewer. In Chicago the en-

(Continued on page 628.)

tire cost of construction is paid by assessment, on the frontage and area basis. In Springfield, Ill., there is a special assessment for laterals and a general assessment for main sewers. In Terre Haute, Ind., all construction is paid for from the general tax levy. In Sioux City, Ia., sanitary sewers are assessed against adjacent property and storm water sewers against the city at large. In Bangor, Me., abutting owners pay three-fourths of the cost and the city at large one-fourth. In Haverhill, Mass., abutting property pays 20 cents per front foot and 0.4 cent per square foot for a depth of 150 feet. In Lawrence, Mass., abutting property pays 6½ mills per square foot for 100 feet back from the street line, and more remote areas pay \$10 per lot of 5,000 feet area. In Lowell, Mass., the city one-half and the abutting property one-half of the total cost. In New Bedford, Mass., trunk sewers are paid for from the general taxes, and the city and the abutting property each pays one-half of the cost of laterals. In Newton, Mass., abutting property pays 15 cents per lineal foot of frontage and 0.55 cent per square foot of drainable area within 180 feet of the street. In North Adams, Mass., an entrance fee is charged for making house connections—\$15 for dwelling houses, \$10 for each tenement and \$10 per tenant for business blocks. In Springfield, Mass., much the same plan has been adopted, but \$25 is charged for a single tenement house and for other buildings one cent per square foot of building area or 1¼ cents per square foot if of more than two stories. In Battle Creek, Mich., the cost is assessed by the front foot, running from 60 cents to \$1 per foot. In Grand Rapids, Mich., a special assessment is made on the district benefited, and this is the practice in Muskegon also. In Butte, Mont., outlet sewers are paid for from the general fund and district sewers by the abutting owners. In South Omaha, Neb., the practice is the same as in Butte. In Elizabeth and Trenton, N. J., the cost of construction and the "benefit" derived therefrom are assessed against abutting property. In Albany, N. Y., the cost is assessed against the entire drainage area. In Binghamton, N. Y., the assessment is 80 cents per lineal foot, 40 cents per lineal foot for corner lots. In Watertown, N. Y., the property benefited is assessed the entire cost for all sewers up to 10 inches in diameter; sewers larger than this are assessed the estimated cost of a 10-inch sewer, the city at large paying the balance. In Asheville, N. C., abutting property pays for the sewer in three annual installments. In Cleveland, O., assessment is by the front foot up to \$2 and anything over this is paid from bonds. In Columbus, O., the assessment is the "benefit to abutting property." In Newark, O., the assessment is by the front foot. In Erie, Pa., the total cost is assessed by the front foot rule. In Harrisburg, Pa., about \$1.25 per front foot is assessed against the abutting property and the balance out of general revenue or loan funds. In Reading, Pa., the sewers are paid for from a general revenue. In Wilkes-Barre, Pa., the sewer is paid for from the general revenue and the city charges \$10 per family for permits. In Providence, R. I., the assessment is 60 cents per front foot and one cent per square foot for 150 feet back, or to the rear of the lot if less than this.

MAINTAINING SEWERS

In the majority of cities there is no special assessment or tax for maintaining sewers, but this is paid for by the city at large, sometimes by a special appropriation but more commonly out of the regular appropriation for the department. In Grand Rapids, Mich., the maintenance is paid out of the ward highway tax. In Williamsport, Pa., the annual charge of \$2.00 per connection is intended, we believe, to cover maintenance as well as interest on the cost of construction.

SEWAGE TREATMENT

Meriden, Conn., has a natural sand area divided into fourteen beds, two of which are used each twenty-four hours, each bed thus being dosed once a week. The beds are cleaned each week before being dosed. The total cost of this plant was \$10,000. The average amount of sewage fed is about 2¾ mil-

(Continued on page 632.)

TABLE No. 6—PUMPING SEWAGE

City	Is Sewage Clarified Before Pumping?	Kind of Pumping Plant.	Average Static Head.	Gallons Pumped During Year.	Pumping Station Expenses.
Chicago, Ill.	No	Seven plants, various kinds. Modern plants have steam operated submerged centrifugal pumps	Varies in different Stations.	18,520,000,000	\$67,250.00
Sioux City, Iowa.	No	Two steam centrifugal pumps. Capacity, 3,000 gals. per minute.	15	(a)	
Newton, Mass.	No	Two 2½-in. centrifugal pumps operated by two 6-horsepower gasoline engines.	28.75	12,141,322	630.00
Newark, N. J.	Yes	Steam plunger pumps, 30,000,000 gal. per day.	16	5,326,365,684	17,421.68
Buffalo, N. Y.	No	7x3x10-in. vertical compressor, 18-in. suction, centrifugal pump.	15	3,500,000,000	12,047.21
		8½x17x12-in. vertical compressor, 24-in. suction, centrifugal pump.	25	500,000	
		10½x20x14-in. vertical compressor, 30-in. suction, centrifugal pump.		gal. per day	
Mt. Vernon, N. Y.		Two centrifugal pumps, motor driven.			
			60		5,117.09
Columbus, Ohio.	Yes	East Side Station, gas, two 10-in. centrifugals.	25		19,530.01
		Main Station, steam, two 12-in. centrifugals, three 20-in. centrifugals.			
Reading, Pa.	No	Steam; two duplex, compound condensing plunger pumps. Snow-rated 10,000,000, actual 7,000,000 gal., 24 hrs	35	1,425,000,000	
Providence, R. I.	No	Three vertical, triple expansion, condensing engines, each running two 24-in. centrifugal pumps, connected by rope drive.	27	6,819,000,000	
Woonsocket, R. I.	No	8-in. centrifugal pump.	20.5		

lion gallons a day. All over this amount is treated in overflow beds, about 250 million gallons having been so treated during the past year. The amount of sewage is determined by gauging at the outlet of the sewage farm.

In New Haven, Conn., about 48,000 gallons a day from the almshouse runs into a collecting tank having a capacity of about 8,000 gallons, where it remains for an average period of four hours. The larger particles are caught by a wire basket in a manhole between the buildings and the collecting tank. About six times a day the tank is emptied onto sand filters. The sludge runs onto beds when enough has accumulated to make this advisable. Very little sludge collects, however.

From the collecting tank the sewage flows onto six intermittent sand filters having a combined net area of 21,600 square feet and a depth of 5½ feet. These are artificial beds of sand on crushed stone underdrained. One-half of these beds were built in 1898 and the remaining half in 1910. During the past year an average of 48,000 gallons per day was applied to the beds, the maximum quantity being about 56,000. In dosing, the sewage flows onto each bed for twelve hours, and then is given two and one-half days' rest. Each bed is ordinarily cleaned as soon as it is dried during each resting period.

At Providence, R. I., the sewage is treated by chemical precipitation, which is preceded by screening at the pumping station. There are four large precipitation tanks and sixteen finishing tanks, the total capacity of all of these being 11 million gallons. The average daily quantity of sewage applied was about 19¼ million gallons. From these was removed an average of 4,089 gallons of sludge per million gallons of sewage. About 700 pounds of lime were used per million gallons. The effluent is discharged into tide water and the sludge is carried down the bay and dumped into deep water. The cost of chemical treatment was \$23,617.06 or \$3.36 per million gallons. In addition to this the cost of sludge treatment and disposal was \$29,661.92, or about \$4.22 per million gallons of sewage treated.

At Woonsocket, R. I., there are five intermittent filters of sand and screened gravel having a net filtering area of 170,390 square feet, 5 feet deep. The first of these was built in 1898, and extensions have been added at intervals since then. The average daily quantity applied was 730,535 gallons. This flows for about six hours at a dose, each bed being used one day out of five. The beds are raked over every time after having been used.

In Mount Vernon, N. Y., the sewage is first received in five septic tanks, which have a total capacity of 1½ million gallons. Only two or three of these are in use at one time. The average daily quantity of sewage treated was about two million gallons, the average length of time remaining in the tanks about eight hours. About two-thirds of a cubic yard of sludge collected in these tanks per million gallons of sewage. The tanks have not been run long enough to learn how often they will need emptying, but Manager Hammond thinks this will probably be every four to six weeks. The sludge is buried in trenches.

The effluent from the five septic tanks is treated on five sprinkling filters having a total net area of 1¼ acres and a depth of about 8 feet. The filtering material is broken stone. This plant was built in 1908 to 1910, the cost of tanks and filters and pumping station being about \$140,000. The sprinkling filters received about 1,800,000 gallons per day on the average, the maximum amount being 2,200,000 gallons. There are about 400 nozzle sprinklers to the acre, which act under a head of 9 feet.

In Reading, Pa., the sewage first passes through a cylindrical screen and then to a settling tank having a capacity of 1½ million gallons. The average amount of sewage treated is four million gallons and the average length of stay in the tank is about nine hours. About 3.22 cubic yards of sludge are produced per million gallons of sewage, and about 50 per cent of the total solids is removed from the sewage by the tanks.

These tanks are emptied every six weeks, and the sludge is pumped into lagoons.

Two sprinkling filters receive the effluent from the settling tank, each of these having a net filtering area of one acre. One of these beds is of broken stone and the other of iron slag, each about 5 feet deep. They were constructed in 1907 and 1908 at a cost of \$35,000 and \$45,000 respectively. The average daily amount of sewage applied to the beds was 2½ millions gallons per acre per day. The effluent passes through settling basins having a capacity of 300,000 gallons. The total cost of maintaining the beds is given as \$3 per day.

The sewage of Columbus, Ohio, is coarse-screened, and then flows through two settling and six septic tanks, the former having a total capacity of eight million gallons and the latter of four million gallons. One-half of these tanks are used at one time. The average quantity of sewage treated per day in 1910 was 12.9 million gallons, and the average length of stay in the tanks was seven hours. About 0.55 ton of sludge was produced per million gallons of sewage, and 62 per cent of the total solids was removed from the sewage. These tanks were emptied five times during 1910 during flood stages of the river, the sludge being discharged into the river and disposed of by dilution. The cost of these tanks was \$66,730.

There are four sprinkling filters, each being an equilateral triangle in shape, having a total net filtering area of 10 acres, 5½ feet deep. The filtering material is crushed limestone. These beds were constructed in 1907 and 1908 at a cost of \$240,000. During 1910 they received an average daily quantity of 1.46 million gallons per acre, the maximum amount being 2½ million gallons per acre. The sewage is applied through sprinklers, the head being from 6 to 8 feet, having been uniform most of the time, although it may be varied up to 10 feet. The final effluent is settled in two basins 4 feet deep, each with a capacity of two million gallons.

DISPOSAL OF NIGHT SOIL

This is in charge of the Board or Department of Health in Wilmington, Del.; Chicago, Ill.; Terre Haute, Ind.; Cedar Rapids, Ia.; Lowell, Mass.; Grand Rapids, Mich.; Butte, Mont.; Reading, Pa.; Providence, R. I., and Wheeling, W. Va. In Battle Creek, Mich., it is in charge of the Board of Public Works; in South Omaha, Neb., of the garbage master, and in Asheville, N. C., of the sanitary inspector. The other cities made no report concerning this. In the majority of cities the removal is done by parties employed by the house holder; the exceptions being Asheville, where all is removed by the city once in two weeks; South Omaha, where about one-third of it is removed by the city an average of once in six months; Grand Rapids, where all is removed by this city; Battle Creek, where it was removed last year from 186 premises an average of once every two weeks, and Cedar Rapids, where about 4 per cent was removed by the city last year.

The city destroys this material in garbage crematories or incinerators in Wheeling, McKeesport and Terre Haute. In McKeesport the city charges 15 cents per barrel for incinerating it. The cost in Terre Haute is given as 50 cents per ton. In South Omaha the city disposes of that which it collects by dumping it into the river. In Butte it is buried in trenches at the city dump. In Grand Rapids it is disposed of on the dumping grounds, the house holder being charged 50 cents per barrel for removal; this city removed and disposed of 21,523 barrels last year. In Battle Creek the city removed about ten tons, which it disposed of on farms as fertilizer. The same use is made of it by private collectors in Lowell. In Cedar Rapids both the 800 cubic feet collected by the city last year and the 21,000 cubic feet by private contractors were dumped into the river. The charge made to the house holder was 10 cents per cubic foot. In Chicago the material is deposited in the public sewers by scavengers, for which they are charged 10 cents per cubic foot. Night soil was removed from about 10,000 premises in this city last year. In Wilmington about 74,000 cubic feet of material was hauled to pits. The house holder is charged 10 cents per cubic foot for the service.

Control of Garbage Disposal

IN the abstract on another page of a paper by Professor Jordan the opinion is expressed that a municipal Board of Health should not be burdened with and have its funds diverted to the removal of garbage, which, in the author's opinion, is not a matter of sanitation, but merely one of municipal house-keeping. There are other very cogent reasons why this service, and the related one of ash and rubbish removal, should not be in the hands of the Board of Health. In the popular mind, and rightly we believe, members of the medical profession are considered best fitted for positions on the Boards of Health; but medical men are not often experienced in such practical

matters as the maintaining of large forces of men and teams such as are required for this work, nor in the mechanical engineering involved in the destruction of refuse by incineration or of garbage by utilization plants. We believe that the great advance in the disposal of garbage which has taken place during the past few years has, to a large extent, been due to the placing of the control of this in the hands of the city engineer or of a consulting engineer making a specialty of this work, rather than in those of the Health Department, as was formerly the practice.

This does not mean that the odors and general nuisance too often created by garbage and ashes are of no importance, but rather that it is a matter which should be controlled by the general police power of the city and remedied by the experience of practical men rather than of physicians on Health Boards.

Essentials of Sewage Purification

The essential features of tank and filter purification of sewage (which includes practically all methods other than sterilization), are the removal of polluting matters in suspension and in some cases an appreciable proportion of those in solution; the modification in the tank or filter of the matters so removed, and the removal of this matter either by the automatic action of the filter itself or by withdrawing it through valves, by pumps, etc. The effects produced by the filter may be divided into two general heads, that produced upon the effluent and the character of the matter voided or removed.

In a settling tank the suspended matter is removed by sedimentation, occasionally assisted by chemicals. In the fine grain filter the removal is largely effected by straining action. In coarse grain filters, such as sprinkling filters and contact beds, the removal is due partly to straining but mostly by surface adhesion to the filter particles and partly by sedimentation upon their top surfaces. In slate beds the last named is the principal form of removal.

The action of bacteria and other vegetable and animal life, together with a certain amount of oxidation and other chemical change, may produce a considerable modification in the character and form of the matter retained in the bed or filter. In fine sand filters there seem to be few living agents other than bacteria acting to produce this result. In coarse grain filters and slate beds, however, larvæ (as of the moth fly found in the Philadelphia experiments described elsewhere in this issue), earth worms and other animal life of the lowest forms; algae of various kinds and bacterial jelly all play their part in changing the organic matter removed into that having many of the characteristics of loam rich in organic matter, and little if any more objectionable to the senses. In the sedimentation tank there is little change in the matter deposited, except that due to septic action which takes place in the so-called septic tank. The latter gives a sludge less slimy and otherwise objectionable and easier to handle than fresh sludge; while that which has been worked over in the Emscher tank seems to have been reduced still further and to approximate in its nature the humous-like material found in slate beds. The matter strained out by the fine grained filter usually remains upon or very near the surface and when dried frequently resembles the dry, flaky cakes which form on wet clay when exposed to a hot sun. The organic matter from a sprinkling filter bears more resemblance to dry leaves, although thicker, being compared to leather by some.

This question of the character of the matter removed from the filter is a very important one in relation to the disposition which is to be made of it; and this disposition is one of the most important and difficult questions now confronting the designer and operator of sewage disposal plants. The humous or leathery matter from slate beds, Emscher tanks and sprinkling filters does not present nearly so many difficulties in its final disposal as the slimy liquid mass removed from precipitation tanks, or the somewhat less objectionable material from the septic tank.

Of only less importance in this connection are the methods

which must be employed for removing this matter from the tank or filter. As stated, it remains almost entirely upon the surface of fine grain filters and is easily removed by spades. That which collects in slate beds is usually flushed out by hose or other vigorous streams of water. Deposits in the sprinkling filters usually dislodge automatically at intervals and can be collected from the effluent in a settling basin with little difficulty or inconvenience. The sludge from settling and septic tanks is usually either pumped out or drawn onto beds by gravity. Probably the most difficult of all is the removal of this matter from contact beds, since it seems to be generally necessary to remove all the filter media from the beds and clean them by hose or otherwise.

In the past, most of the attention of investigators was paid to the character of the effluent obtained, and not enough to the difficulties of removing and disposing of the solid matters which collect in the plant. It is possible that this is to some extent responsible for the too general tendency of those who are placed in charge of the sewage treatment plants to fail to keep them up to a proper working condition; and it is hoped that with the study of this feature of the maintenance of such plants and the progress which is being made in removing or ameliorating the difficulties, together with an appreciation of the importance of proper maintenance and the employment of a higher grade of superintendents for this purpose, the actual operation of sewage disposal plants in this country will in the future more nearly approximate the intentions and promises of the designers.

For Better Sewerage Construction

In most branches of municipal and other construction there has been a great improvement in recent years in the materials and methods used and in minor details looking to greater perfection. Public funds have been appropriated and talent of a high order has been devoted toward working out better methods of sewage treatment, and more recently of disposal of sewage by dilution. But there appears to have been little change made in the collecting system for either house or storm water, as to either the main conduits or the appurtenances, if we except the adaptation of reinforced concrete to the former.

It may be said in extenuation of this that the materials which have been used for years are as satisfactory as can be expected, and that no change is necessary, and in a general way there is much truth in this. On the other hand, there frequently occur conditions where the sewer conduit requires special construction but does not often receive it; such as wet ground, where water-tightness is desirable.

The sewer conduit is buried beneath the surface of the street, and generally deeper and more inaccessible than any other sub-surface structure. It is therefore a matter of only ordinary economy and common sense to make sure that the materials and methods of construction are such as to obviate any future necessity for repairs due to a breaking of the sewer because of weakness, to gradual disintegration of the material or to wearing out of the invert. These practical precautions are as important as designing adequate capacity or securing sufficient, uniform grade to prevent deposits. Because of the difficulty of rectifying errors and because of the great importance to the health and convenience of the citizens of the uninterrupted serviceability of a sewerage system, there is, perhaps, no place where experimenting with doubtful materials or methods is more out of place or likely to prove more disastrous.

Unfortunately there seems to be an impression in the minds of many city officials and even engineers that, because there are available for sewer conduits for ordinary conditions comparatively cheap materials which are sufficiently serviceable, no conditions justify any great expense for sewer conduits. No one complains against the cost of iron pipe for water mains, which is much more expensive than the cost of the vitrified sewer pipe for removing this same water through a

house sewerage system; but should the presence of a large amount of ground water make it desirable to secure an impervious conduit there is great hesitancy and frequently absolute refusal to spend a few cents a foot additional in securing tight joints; although there is no question that it is possible to make perfectly tight sewer joints, nor that the failure to do so threatens the pollution of soil and ground water with sewage and adds greatly to the expense required for treating sewage; this latter point being especially likely to be overlooked when treatment is not immediately necessary.

Concerning the appurtenances of sewerage systems there seems to be even more necessity for more thoughtful consideration of the requirements and adaptation of the means to the end. We have frequently referred to the fact that catch basins are used in connection with surface water inlets more commonly than is necessary, and further argument in support of this is given in the statistics printed in this issue, these showing that most of the basins in the sixty cities reporting are not cleaned oftener than once or twice a year, and a considerable percentage of them are apparently never cleaned at all. Chicago reported 26,281 basin cleanings last year, the total number of basins being nearly 76,000. A basin is of little service if not cleaned at least three or four times a year; consequently, not more than 8,000 basins are giving real service in Chicago, and about 68,000 have been built in Chicago which are unnecessary, or at least are giving no returns; and if we assume these to cost but \$25 each (additional to the cost of a plain inlet) we have an expenditure of \$1,700,000 which was not only unnecessary but (since an uncleaned basin is a collector of filth and a disseminator of odors) is actually detrimental. We select Chicago as an illustration not because it is exceptional but because it is one of the few large cities which have the highly commendable habit of collecting statistics concerning the operation of its sewerage system. In another article we refer to the design of surface water inlets and to the fact that there are, perhaps, no more absurd and ineffective devices used by the Borough of Manhattan than its inlet openings.

To mention only one other appurtenance of the sewerage system which would seem to merit more attention than it has received, the ordinary method of making house connections or of locating the branch pipes for such connections appears to need improvement. Not much concerning this reaches the public print, but we know that in scores of cities it is impossible to find house connections a few years after the sewer has been constructed; or, at least, they are not found, and plumbers make more or less successful attempts at breaking open the sewer and connecting the house drain therewith, frequently producing a cracked pipe, a leaky joint and a deposit of cement in the bottom of the sewer and projecting drain pipe which form obstructions to the flow.

Modern science has made great progress in improving upon the older methods of sewage disposal, garbage disposal and other kindred problems. The questions connected with the sewer conduit are not as pressing, perhaps, but such as they are they are of even greater importance and should receive equally wise and careful attention. In no municipal structure is it truer that "the best is none too good."

UNDERGROUND STORM SEWER OUTLET

All the storm and waste water of a considerable area of the City of Reading, Pa., which is collected by sewers, was designed to discharge into a well at a street intersection, at the bottom of which was a seam in the underlying rock into which the water disappeared for three years after the construction of the well. A few months ago this well caved in, the dirt filling up the crevices so that they refused to take the water any longer. Efforts to locate other wells so as to avail of similar crevices proved unsuccessful, and the only solution was to construct a sewer to discharge into the river. We have previously referred to similar instances in other cities, but they are sufficiently unusual to make them of some interest.

SPRINKLING FILTER EXPERIMENTS

At Philadelphia Experiment Station—Various Kinds and Sizes of Media—Growths On and In Filter Beds—Effect of Ventilation—Clogging and Unloading—Hypochloride as Cure for Clogging

AMONG the experiments in sewage purification conducted at the Philadelphia sewage experiment station, those upon sprinkling or percolating filters received the most attention. Fourteen sprinkling filters were operated, a battery of six being out of doors, and two large ones, a battery of five small ones and a Hamburg filter, being inside the building.

The six outside filters each had an area of 0.002 acre, and were arranged in three pairs, each pair forming a square in the center of which was a Columbus nozzle. These filters contained the following filtering media: No. 1, seven feet of $\frac{3}{4}$ -inch to 3-inch limestone; No. 2, eight feet of $2\frac{1}{4}$ -inch to 4-inch limestone; No. 3, five feet of 1-inch to 3-inch slag; No. 4, six feet of 1-inch to 3-inch trap; No. 5, three feet three inches of $\frac{1}{2}$ -inch to $2\frac{1}{2}$ -inch gravel, during the first part of the experiments, and the same depth of $1\frac{1}{2}$ -inch to 3-inch trap during the second half; No. 6, four feet three inches of $\frac{1}{2}$ -inch to $2\frac{1}{2}$ -inch trap. The filters were built on a concrete foundation, the floor of each sloping so as to concentrate the effluent at the outlet. Wooden posts and planking form the sides of and partitions between the units.

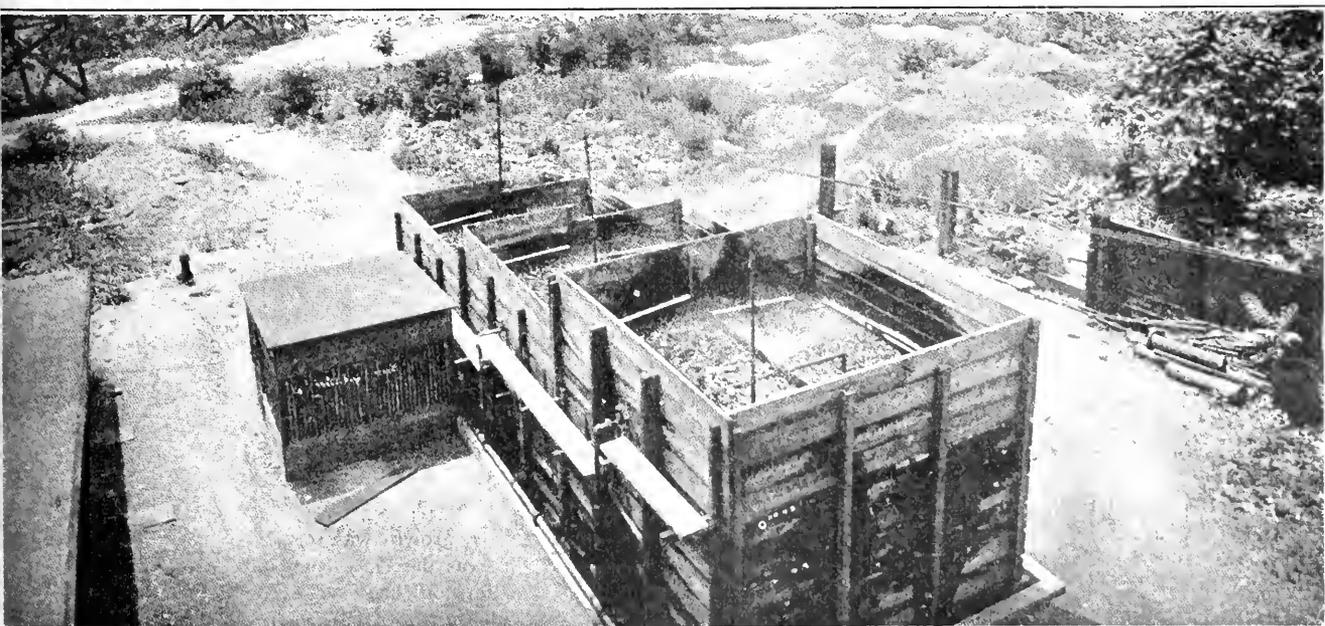

These filters received a sewage which had been roughly settled in a wooden tank, from which it flowed under a constant head through a 3-inch pipe to a dosing tank. This consisted of a cylindrical wooden tank, the inlet of which was controlled by a float valve and the outlet by a shear valve, both of which were operated by a float and weighted lever in such a way that the tank was alternately filled and automatically emptied. The bottom was given the approximate form of a frustum of an inverted cone, by bricks placed in the bottom of the tank; the object of this being to improve the uniformity of distribution upon the beds.

Of the two large indoor filters, one was 0.01175 acre in area and six feet deep above the underdrains, the filtering medium being hard clinker rejected by a $\frac{1}{2}$ -inch screen, the underdrains being formed of slabs of old concrete pavement. Taylor square nozzles were used during the first part of the test, and Reading nozzles during the latter part. The sewage applied was previously screened through $\frac{1}{2}$ -inch and $\frac{1}{4}$ -inch screens. A constant head was maintained in the dosing tank. An undulating

head upon the nozzles was obtained by a butterfly valve in the pipe line, the lever of which was controlled by a cam which was revolved by an over-shot water wheel. The other of the two large filters contained 6 feet 6 inches of hard stone, broken by hand into sizes ranging from $\frac{3}{4}$ inch to $1\frac{1}{2}$ inches. The drains were composed of 6-inch split vitrified pipe, with lugs on the edges. Over the central main drain 12-inch by 24-inch slates were laid, and on them three 4-inch vitrified pipes perforated by $\frac{1}{4}$ -inch holes were stood in a vertical position as ventilators, and other ventilators were placed along the sides composed of the underdrain tile. At three feet depth these ventilating pipes were connected together by horizontal 3-inch perforated pipes. The vertical ventilators extended to the surface of the filter material, where circular terra cotta caps were cemented on. This ventilating system connected at one corner to a 6-inch galvanized iron chimney, upon whose top was a cowl so arranged as to always produce an upward draft, with the intention of always drawing air from above the surface of the filter down through the ventilating system. The main drain was trapped at the outlet to prevent air entering there. Two Taylor nozzles were used, and an undulating head upon them was obtained in the same way as in the case of the other filter. The cam for this filter, however, was so designed that the nozzle was playing almost the entire time.

To study the effect of the nature of the filtering material upon the results, a battery of five small filters was used, these containing common marbles (spheres), gravel (spheroids), broken trap (irregular), broken slag (irregular), and broken coke (irregular), which had passed a $\frac{5}{8}$ -inch screen and been rejected by $\frac{1}{2}$ -inch. These were placed on a false floor of $\frac{1}{4}$ -inch mesh wire screen. Each of these small filters was dosed from a tipping tray.

The so-called Hamburg filter was constructed in a wooden tank of eight square feet area. The bottom was of sloping concrete, upon which was placed 2 feet 4 inches of clinkers, ranging in size from "fist to child's head," the spaces between the top layer being filled with $1\frac{1}{8}$ -inch clinker. On this was placed a distributing medium, a 4-inch layer of $\frac{3}{8}$ -inch to $1\frac{1}{8}$ -inch clinker, and on this 4 inches of $\frac{1}{8}$ to $\frac{3}{8}$ -inch coke and

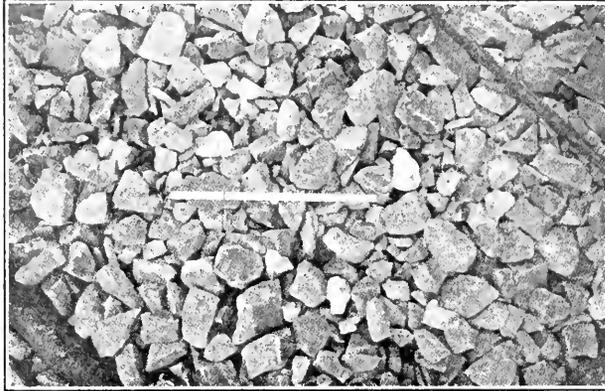

OUTSIDE SPRINKLING FILTERS, PHILADELPHIA SEWAGE EXPERIMENT STATION

1½ inches of 1-25 to ½-inch coke. One-inch holes were bored around the tank below the distributing layers to furnish ventilation, and this was also secured through the effluent openings.

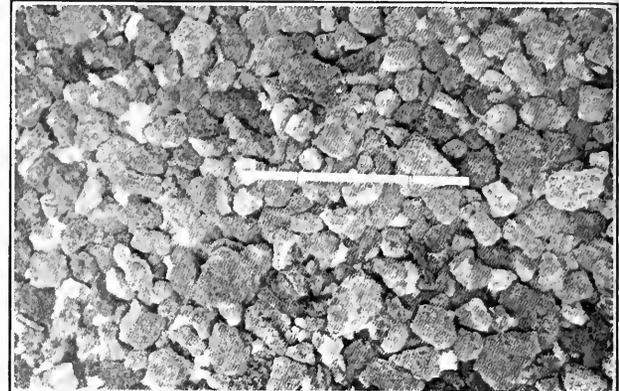

In general the rate on the outside filters was approximately one million gallons per acre per day. During the winter the rate was slightly increased, not by applying more sewage in a given time, but by the reduction of the area in service caused by the formation of ice in the corners of the filter. The tests generally seemed to show that, neglecting other factors, the maximum rate at which a filter can be economically operated is in inverse proportion to the amount of suspended solids applied. Owing either to the better underdrainage system or to the ventilating system, or both, the lower of the two inside filters,

favored the retention of both solids and bacterial jelly to such an extent as to make it very difficult to prevent clogging, and the unloading of the digested solids was less readily effected also.

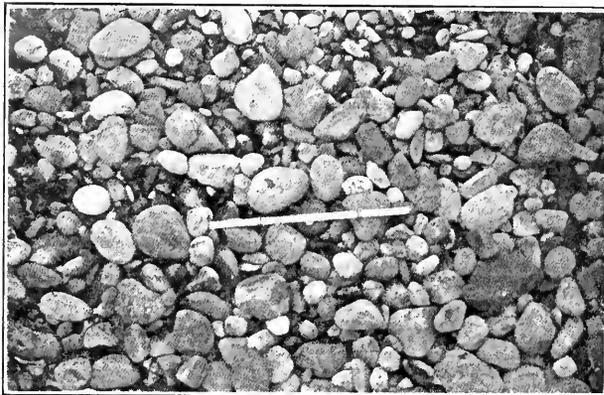

During these tests the size of limestone particles was reduced to a considerable degree by either a breaking down or dissolving of the limestone. To a certain extent the slag particles were also reduced in size. The trap rock showed very little change. Approximately the limestone in bed No. 1 changed from an average of 2 inches to an average of 1½ inches, and that in bed No. 2 from an average of ¾ inches to an average of 2¼. The slag in No. 3 changed from an average of 2½ inches to an average of 1½.

MEDIA USED FOR SPRINKLING FILTERS.—SCALE ABOUT ONE TO TEN.

although operated at a higher rate than the outside filters, produced a better effluent. This result was also probably assisted by a better protection from the weather, the more perfect distribution and better preparation of the applied sewage.

All observations tended to show that biological action is most efficient when regular, and that the sprinkling filters gave the best results when the sewage was applied continuously at a uniform rate over the entire area. This was found impossible of attainment with a fixed head on the nozzles, but was quite closely approximated by the use of the falling head, and especially by the undulating nozzle pressure described above. With this cam in service, although the spray alternately approached and receded from the nozzle, thus giving brief periods of rest to each part of the filter, and the volume discharged varied with the head, this occurred at such short intervals that the effluent left the filter at a practically constant rate, the pimple formed by the hook gauge at the weir used for measuring the effluent varying so little that it was impracticable to read the fluctuation.

A comparison of the various media showed that the smooth, rounded gravel did not retain a growth of bacterial jelly as well as did the limestone and trap, did not remove the impurities as effectively, and was generally less desirable. At the other extreme was the slag, which, with its rough, porous surface,

A peculiarity of the slag was the growth, upon the surface of the bed, of algae, known as cyanophyceae-oscillaria. A similar growth of algae had been found to take place on a slag bed at Reading, Pa. Another peculiarity of the slag was the fact that it apparently retained heat longer than the other media, or else created heat by some internal action; this being indicated by the fact that the slag bed resisted the formation of ice upon its surface much longer than the others.

As we have had occasion to suggest in a previous issue, there would appear to be considerable information as to the working of filter beds to be derived from a study of the algae and other growths which occur upon them. Aside from the bacterial jelly, which is found to cover the media to a greater or less depth there appeared at different times upon several of the beds several different kinds of growths. The most striking of these was a luxuriant growth of pink gelatinous material which followed the clogging and pooling of the filters. (Probably the same or a similar growth was that observed at Dorking, England, where it was described as a pinkish-yellow filamentous growth. In Kingston, England, a short, fibrous, gray growth appears annually on the surface of the filter between November and March, forming an almost impervious mat.) On outdoor filter No. 5 a layer of material resembling a mat of wool fibres

increased in bacterial jelly formed between the upper layer of stones and the ones immediately beneath, which seriously decreased the surface aeration of the bed and also its porosity.

The clogging of the filters seemed to be confined to the upper inches of most of the beds, the exceptions being the slag bed, which sludged up to a depth of 16 inches, and the fine trap bed, where the worst clogging was confined to the upper 3 inches. In most of the beds large quantities of larvæ were found, probably those of the moth flies which are found in enormous quantities around most sprinkling filters. These larvæ were found adhering to the cleaner stones within the top foot. They were especially numerous in the lower indoor bed, which was provided with the special aerating pipes, large numbers of the stones below the depth of 3 inches being covered by very active white larvæ.

As was shown some time ago by the special experiments at Waterbury, Conn., an examination of these beds at the end of the test indicated that there had been no lateral sub-surface distribution, as all of the stones in the corners of the beds which were not reached by the spray were perfectly clean.

The ventilated indoor bed gave excellent results, better than any of the others, but in spite of this the experimenters believe that there is not sufficient variation in the action of the filter under these two conditions (with and without the special ventilators acting) to show conclusively any distinct advantage due entirely to the use of ventilating appliances, although it is believed that ventilation will distinctly benefit and render uniform the action of the various parts of a percolating filter, and that its absence might tend to foster clogging or reduce the effectiveness of a filter in spots." We do not understand from this just what the conclusion on this subject was, unless that ventilation is very desirable, but that this particular method of curing it may have been unnecessarily elaborate.

One of the important features of the operation of a sprinkling filter is its automatic unloading, or voiding of digested suspended matter. Unless this takes place periodically the bed will clog and become more or less impervious. The methods employed at the testing station for securing this cleaning out of the beds were five: (1) Resting the beds, in order that the accumulated matter should dry sufficiently to desquamate and be washed out by the ordinary discharge from the nozzle; (2) washing the filter with water from a fire hose under pressure; (3) applying dry bleaching powder to the surface; (4) applying a strong solution of bleach through the filter nozzles; and (5) continuous disinfection of the influent.

The first method involves no expense, and with a well-constructed bed of uniform-sized large particles was successful in warm dry weather, but not in winter. The use of water jets under pressure removed large quantities of solids and left the bed in good condition, but it would require two or three men to manage the hose, would require probably a day for each acre, and the use of 100,000 to 150,000 gallons of water per acre. The use of dry bleaching powder, while successful, was not economical, but the application of a strong solution of bleach to the influent at the rate of two tons of powder per acre was found to be quite successful. The continuous disinfection of the influent maintained the filter in perfect condition, and supported the claims made for it by Dr. Rideal; it would require inexpensive apparatus and the same services for an attendant as is required for disinfecting water supplies. This bleach was found to destroy and eliminate in an hour or two the pink growth previously referred to. At one time when the lower indoor filter had been badly clogged it was entirely cleared in five hours by applying to the influent 850 pounds of bleach per acre. (This clogging followed about a week after the discontinuance of the ventilation system.)

When the beds unloaded after a rest it was found that the coarse trap bed unloaded the best, the process being a steady, even discharge of solids, which continued for quite a time. The coarse limestone, due to its large voids, easily yielded the stored solids, while the slag bed, probably due to the porous nature of the medium, which allowed the slimy deposit to take a firmer

hold upon it, discharged the solids only after several hours' service, and in less amount than the small-sized trap rock. The fine limestone, on account either of its depth or of the small size of the voids, or other unknown causes, discharged very little of the stored matters.

At once after the unloading in the spring the quality of the effluents all improved. This might not be entirely due to the rest and unloading, but partially to the increasing temperature stimulating biological activity. This unloading took place after the accumulation of solids during the winter, when the biological activity was at a minimum; and it was found that there was a slight continuation of the unloading for several weeks after the first maximum voiding of stored matter.

The upper indoor filter was operated to determine whether it is possible to operate a fine media bed, over which roughly screened sewage is well distributed, by properly arranged resting periods and raking. It was judged from this experiment "that it is not practicable to apply a poorly prepared influent to a sprinkling filter, expecting to maintain it by rest and rakings, on account of the low rate of operation and high cost of maintenance, together with the inequality of the effluent over extended periods."

Concerning the removal of bacteria, it was found that each of the beds removed on the average from 75 to 87 per cent., although during the period of unloading the numbers in the effluent were in excess of those in the influent. At times the percentage ran above the nineties for several weeks at a time.

It was believed that, although fats are very resistant substances, in the beds having the greatest bacterial action, at least, the fats were oxidized, as less of such matter was found in the effluent than in the influent, and none was found stored in the beds at the end of the experiments.

Concerning the stability of the effluents, the report contains the following:

The object of the sprinkling filter is to render stable the putrescent matters of sewage. Over long periods of time it ought not to remove solids, for in order that such a filter shall not become clogged it must unload the accumulated matter, and thus establish an equality between total suspended solids in the influent and effluent.

Also many substances nitrogenous or carbonaceous in their composition and therefore reported in the analyses under organic nitrogen or oxygen consumed, are stable, and not acted upon in transit through the filter; therefore, to preserve the permanence of the filter, they should be thrown off.

The measure of the putrescence of sewage is its avidity for oxygen. An effluent which requires but little oxygen from the stream into which it may be discharged will continue to improve as the stream flows on, regardless of the stable organic matter contained in said effluent.

For these reasons much weight should be given to the determination of relative stability of sprinkling filter effluents.

Comparing the general action of the fine limestone bed and the coarse trap bed, it was concluded that the oxidizing power of the seven-foot bed of coarse trap was equal to that of the eight-foot bed of fine limestone; and the almost perfect condition of the trap at the end of the test, as compared with the slightly clogged condition of the finer limestone, was much in favor of the shallower and coarser bed.

Apparently about the only conclusion of importance from the operation of the Hamburg filter was that it is impossible to maintain a sufficiently high rate with this method of distribution. After one week of service the upper or distributing layer of coke was so clogged with the suspended solids and colloidal matter that sewage stood continuously on the surface, and this layer did not seem to unload itself. It was found that the fine coke was embedded in a gelatinous mass, forming an almost impervious layer.

The suspended solids in sprinkling filter effluents are either granular or flakey. In August they averaged 29.5 per cent mineral matter from one bed and 35.5 from another. Settling for a nominal storage of two hours in a horizontal tank proved sufficient to remove a large part of the suspended solids and yield a uniform effluent.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Street Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Movement for Good Roads to Be Made National.

Phoenix, Ariz.—Governor R. E. Sloan has been asked to issue a call for a good roads convention, which, it is hoped, will be the beginning of an attempt to institute a movement, national in scope, for the construction of a transcontinental highway. This highway, it is understood, is to secure the backing of the automobile manufacturers throughout the United States, and of this support the movement is already assured.

Oiling the Streets

Kingston, N. Y.—Street Superintendent Simpson has given Albany avenue a coating of oil to lay the dust. An experiment in the calcium chloride treatment for laying dust will be tried under the direction of the Street Superintendent on Railroad avenue in the near future. A representative of a Syracuse concern is anxious to make the test, and Railroad avenue was chosen as combining all kinds of traffic.

Old Bridge Caves In

Trenton, N. J.—A section of the South Warren street stone bridge about 8 by 50 feet in area caved in last week. All of the sidewalk and part of the roadway on one side fell in. The structure is 50 feet in length and 75 feet wide.

Courtesy Daily State Journal, Trenton, N. J.

LEAKAGE FROM SEWER BREAKS DOWN OLD BRIDGE

It is believed that the structure was made weak by leakage from a sewer. The main portion of the bridge was built in revolutionary days and the passageway was constructed in 1822.

Sidewalk Laying Will Be Pushed with Vigor

Altoona, Pa.—Mayor Hoyer has announced that the annual sidewalk crusade has been inaugurated and will be pushed vigorously throughout the summer. The daylight patrolmen were given a number of notices to be served during the present week, and next week a special officer will be delegated to give his entire time and attention to the sidewalk work. The work will be pushed vigorously in every ward of the city, wherever new walks are needed. The notices that are served by the officers give the property owners ten days in which to award contracts and get the work under way, and it was stated by the Mayor that where the property owners fail to comply with the notices the walks will be laid by the city and the property owner compelled to pay for it under the provisions of the city ordinances. There are already some on the list who failed to comply with the notices last summer, and their walks will be promptly laid by the city authorities.

Plan Boulevard System

South Bend, Ind.—An elaborate municipal boulevard system which may eventually extend north to St. Joseph Mich., is now proposed by the South Bend Board of Park Commissioners. The improvement, which would mean the beginning of a boulevard park system for the city, is made possible in the new powers of park boards of second-class cities. The added power is the result of laws which were adopted during the last session of the State Legislature. The plan for a boulevard system in South Bend and its ultimate extension through Southern Michigan to Lake Michigan was launched at a recent meeting of the Park Board. The boulevard as discussed would have its inception on the north side of the river at the dividing lines of South Bend and Mishawaka, continuing west to the west bank of the St. Joseph River, and thence north along the river to the beginning of Riverside Drive. This pretentious thoroughfare would form a portion of the boulevard, it is planned, continuing through Leeper Park and following the river bank to Mosquito Glen Bridge, four miles north of the city.

City Paving Work Completed

Puyallup, Wash.—The street paving contract has been completed and the Warren Construction Company is shipping the remnants of its plant as fast as possible to different parts of the country. The first paving was laid in Puyallup in November, 1909. In all, the company has spent 18 months in the city doing the work. It was impossible to work constantly, however, because of weather conditions. Puyallup now has about 75,000 square yards, or approximately 6½ miles, of paved streets. The work has been done at a cost to the city of about \$250,000.

Contractor Took Liberties

Altoona, Pa.—Mayor Hoyer caused his policemen to stop repairs to the paving destroyed several weeks ago by the breaks in water pipes, because the contractor was selling the old bricks and proposed to use new ones in the repairs. Mayor Hoyer maintains the old bricks belong to the city, unless the contractor is going to use them in the repairing. The City Solicitor has been asked for an opinion.

For Auto Road

Hamilton, Mont.—The Hamilton Chamber of Commerce has about completed arrangements for the launching of a campaign, which, if successful, will result in the establishment of a park to park highway under federal, state and county control, and connecting the Yellowstone National Park with the Glacier National Park. The road, if built, will be about 450 miles in length, and will cross six or seven counties. As planned it will traverse the entire length of the Bitter Root Valley, passing through Missoula, then across the Flathead reservation along the east side of Flathead Lake, and then to Glacier National Park. The road will pass through approximately 40 towns, connect two military reservations and cross four great railroads. Passing as it would through much of Montana's scenic country the road will furnish abundant opportunities for tourists. At the present time the road is well defined, and needs only to be united and some sections built.

Move for Good Roads

Bowling Green, Ky.—Good roads projectors of Tennessee and Kentucky met here last week to frame plans for the completion of the Lincoln-Jackson way. A large delegation of Tennesseans, headed by 500 citizens of Nashville, assured the Kentuckians they will be ready to go on with the highway as soon as the Kentucky section of the road reaches the State line. It is planned to extend the Lincoln-Jackson way from Mammoth Cave to Nashville via Bowling Green and Franklin, over the old Louisville and Nashville Pike.

SEWERAGE AND SANITATION

Important Contracts for Sewers Are Begun

Syracuse, N. Y.—Work is now in progress on three of the most important contracts of the general intercepting sewer improvement. Young & Douce started driving piles in Sawatha avenue for the foundation of the north section of the Harbor Brook intercepting sewer. The C. T. Hookway Construction Company is nearly ready to place concrete for a part of the southern section of the same improvement and concrete is being placed in Wallace street and North Franklin street on the Onondaga Creek intercepting sewer. The first work south of West Onondaga street on the Onondaga Creek sewer will be started in a few days. The tunnel under West Onondaga street has been finished and an open trench will be excavated through the property of the Delaware, Lackawanna & Western Company between West Adams and Onondaga streets as the first section.

Public Meeting to Talk Sewage

Hasbrouck Heights, N. J.—That the sewerage question is a live issue was made known at a recent Council meeting, when Mayor A. C. Austin was authorized to call, at his pleasure, a public meeting to discuss the matter. As a preliminary Mayor Austin will talk upon the sewerage question at the next meeting of the Borough League Forum.

State Board Orders Sanitary Measures

Oil City, Pa.—The citizens of Oil City have been instructed by Dr. Dowling, of the State Board of Health, to immediately clean up their town, provide better drinking water, improved street drainage and enforce sanitary and health rules in restaurants and other public service establishments. Lemargarine, Dr. Dowling states, has been served for butter, and canned milk mixed with water for dairy milk has been popularly served.

Important Additions to Sewer System Necessary

Buffalo, N. Y.—A system of sewers that will cost the city several millions of dollars is now claiming the attention of the Board of Councilmen. The tough question is: How are they to be paid for? Commissioner Ward, who proposes the building of this system, recommends that it be made a general fund charge, and the Board of Aldermen has approved his recommendation. A majority of the Board of Councilmen voted in committee to approve it, but at least some members believe they should be paid for by local assessment levied in the sewer districts benefited. As recommended by the Commissioner, an enabling act will be necessary to issue bonds to pay for the sewers in the first instance. He favors spreading the payment over a long period of years and creating a sinking fund for that purpose. If the Mayor signs a majority report that probably will be adopted the bill will be sent on to Albany as soon as it can be prepared. "The bill should be broad enough," says the Commissioner in his communication, "to cover the necessary general improvements, but guarded against the inclusion of local sewers."

Pure, Clean Food in Seattle

Seattle, Wash.—Seattle now has an ordinance making the strictest kind of regulations concerning clean food. The whole matter has been put under the control of the Health and Sanitation Department. The "bakery ordinance" requires a bakery, candy kitchen, restaurant or confectionery to apply to the Commissioner of Health for a permit, which is to be issued only after the Commissioner of Health has caused to be inspected all the fixtures and appliances to be used. The requirements for light, ventilation, cleanliness and the attire of workers where food products are prepared are very strict. The workmen are required to file certificates to be approved by the Commissioner of Health. The use of tobacco in the workrooms is forbidden. An ordinance requires screening of all prepared foods—that is, foods which are not necessarily to be cooked before eating. The Health Department makes a bacteriological examination of milk of all the more important dairies every month, and a chemical examination every few days. This method, the Health Commissioners report, has almost entirely changed the character of the city's milk supply.

Property Holders Refuse to Use New Sewers

Millville, N. J.—Complaint has been made to the State Board of Health that, although Millville has erected a sewage disposal plant at the cost of about \$25,000, a number of property holders refuse to connect with the city system, but are still using a private sewer which dumps into Maurice River.

Sewage Disposal Plant of New Britain

New Britain, Conn.—The expenditure on the sewage disposal plant to date is approximately \$100,000, and probably before the city will fully accomplish its purpose another sum nearly equal will have to be paid out. The filtration plant is troubled considerably on account of iron in the sewage and the beds filter 6,000,000 gallons of sewage, when they were primarily designed to filter 3,000,000 gallons. The trouble caused by the presence of iron in the sewage will probably be the reason for early action on the subject.

Will Investigate Cost of Sewers in Other Cities

Macon, Ga.—The Mayor has appointed a special committee that will make an investigation into the cost of sewers in other cities as compared with the expenses here. The committee will visit Atlanta, Memphis, Birmingham and other cities so as to obtain the facts and figures first hand. The investigation will be made at once, as Council has suspended the sewer work for only thirty days.

City Gets a Premium on Sewer Bond Issue

Syracuse, N. Y.—City Comptroller M. E. Monahan has received payment for the \$100,000 intercepting sewer bonds which were sold to Curtis & Sanger, of Boston, April 13. The money was deposited and will be at the disposal of the Intercepting Board. The bid on which the bonds were sold was \$103,301.11 and accumulated interest. The interest for twenty-three days from the date of the issue of the bonds is \$287.50, which, with the premium of \$3,301.11, amounts to \$3,588.61. The bonds bear 4.5 per cent interest, but the premium reduces the interest to a basis of 4.09 per cent, and if the use of the premium by the city is considered the interest charge is reduced to 4.01 per cent. The same price was paid for the \$100,000 of park improvement bonds, which, according to the bond agents, is the highest given for municipal bonds in the last eighteen months. This fact, Comptroller Monahan pointed out, speaks well for the credit of the city. In all, twenty-six firms bid, four offering over \$3,300 premium, six of the others offering over \$2,800 and only two offering less than \$2,000.

Plans for Milk Exhibit

Philadelphia, Pa.—Upward of 300 persons, many of whom represented civic societies, attended a conference at the Mayor's office recently in the interests of a milk exhibit soon to be held in this city. Dr. Joseph S. Neff, Director of the Department of Public Health and Charities, presided at the conference. Much enthusiasm was manifested by those present, who assured Dr. Neff the heartiest co-operation in promoting the forthcoming exhibition. The milk exhibition, which will be one of the most unique affairs of its kind ever held in this country, will begin May 20 and will continue the entire week. The exhibit follows naturally upon the work of the Milk Commission, which lately made an exhaustive report on pure milk to the city authorities, the American Association of Medical Milk Commissions and Certified Milk Producers' Association of America, organizations whose work is confined to the problem of improving the milk supply of the country, meet in this city while the exhibition is in progress. Director Neff, in a brief address, reviewed the history of the handling of milk in this city, taking the opportunity of commending the newspapers for the part they have had in the crusade. Dr. Samuel Hamill explained the purpose of the milk show and announced that at conferences of two organizations to be held in connection with the exhibit 61 cities would be represented. He said that the aim of the exhibition was not to alarm consumers, but to point out the mistakes that are being made. He said that health officers and physicians would deliver lectures, and moving pictures would be used to show the danger of carelessness in the various processes between production and consumption. In conclusion he declared that much of the criticism leveled against the producers of milk should be leveled against the consumer.

WATER SUPPLY

Columbus Water Supply Polluted by Sewage

Columbus, O.—The State Board of Health will be requested to investigate the conditions relative to the alleged pollution of the Scioto River at Marion, Kenton, Magnetic Springs, Prospect and Marysville. This decision was reached at a meeting of the Board of Health after Dr. Clemmer read a communication from W. R. Copeland, chemist of the municipal filtration plant, in which he recommended that the above cities be compelled to erect sewage disposal plants. It is claimed that in these cities the Health Board is not following out the rules of the State Board, and that the source of the Columbus water supply is being polluted. The recommendations of Mr. Copeland were made after a personal visit to the towns.

Court Sustains Right to Cross Property with Water Conduit

Ogden, Utah.—A decision has been handed down in the District Court authorizing Ogden City to enter upon certain property in Ogden Canyon owned by W. G. Wilson and proceed to construct thereon that portion of the city's Cold Water Canyon conduit specified in the plans adopted by the Engineering Department. Mr. Wilson objected to the conduit being installed across his property without being remunerated for the privilege, and obtained a restraining order from the court. He placed his damages at \$1,000, which the city considered exorbitant, and condemnation proceedings were instituted, as in the cases of the owners of the Badger-Farr property and the Ogden Medicinal Springs Company. The work will not be delayed.

City Takes Steps Toward Purchase of Water Plant

Racine, Wis.—At the first meeting of the new Common Council a resolution was adopted empowering the Mayor, City Engineer and City Attorney to confer with the water works company as to the possibility of an amicable transfer of the plant to the city and to secure if possible the company's estimate of the value of the plant. An official notice and copy of the resolution was served on the water company for the purpose of opening the negotiations.

Special Court Appraises Water Plant

Council Bluffs, Ia.—A special court appointed to appraise the Council Bluffs water plant in the decision fixed the value of the plant at \$510,500. The result of the condemnation proceedings is a disappointment to both sides. The city expected a valuation of \$450,000 and the company wanted \$700,000. The company's offer to sell to the city for \$500,000 made during the appraisal hearing was refused.

Town Affected by the New Water Works Statute

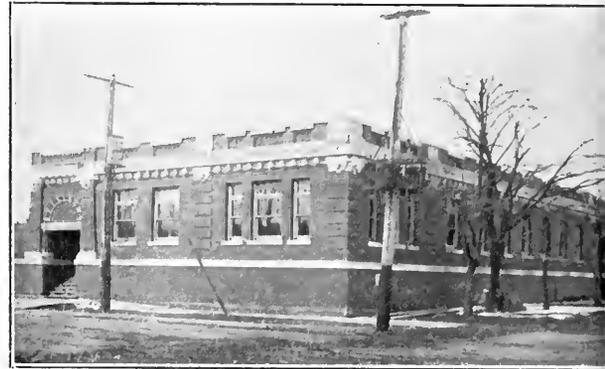

Kearney, Neb.—The last Legislature passed a law requiring customers of water works municipally owned to pay for the extension of pipes, and this law comes as a check on an extensive improvement campaign planned by the City Council of Kearney, although improvements and extensions of the city water property this year will be made regardless of the law. It is believed that the number of improvements will be lessened by this law, but that there will still be extensions sufficient to keep a force of men busy putting them in. The demand for extensions has been unusually great since the city assumed ownership of the plant. Many of these demands come from new sources and will mean new customers, while others are for improvements to the system as it now exists.

Filtration Plant Employees to Be Under Civil Service

Cohoes, N. Y.—As the filtration plant has practically been completed and will soon be placed in operation, there arises much conjecture as to whether or not the men who are to be employed at the plant will be under the jurisdiction of the Civil Service Commission. Men who are more or less skilled in the work will have to be employed at the plant, and for this reason, and because of the fact that there is much valuable city property to be taken care of at the new city institution, it will be necessary, so it is understood, to have the men who are to work at the plant pass an examination as to their fitness, and this examination will be conducted by the Civil Service Commission.

Waterloo Water Works Improvements

Waterloo, Ia.—Improvements in the water works have been going on for a year and are not yet completed. The illustration shows the new water works office just occupied. It is built over one-half of a reservoir which holds 2,000,000 gallons. At some later period a four-story municipal building may be built over the other half of the reservoir, found

WATER WORKS OFFICE OVER RESERVOIR

tions having been put in with this in view. The office measures 40 by 120 feet. The facing is of pressed brick and the trimmings Bedford stone. The cost of the building was \$10,000. The water in the reservoir comes from two artesian wells. A third is being drilled and has been sunk to a depth of 940 feet. For the first 150 feet it is 20 inches in diameter and from that point 12 inches.

Official Test of Standpipe

Montgomery, Ala.—An official testing of the standpipe at the river pumping station has been made. This plant is to furnish river water for boiler purposes for railroads and manufacturing establishments. It has a capacity of from one-half to a million gallons of water. No flaws have been found.

City Collecting Old Water Bills

Spokane, Wash.—Bills for tapping city water main amounting to \$8,000, some of them outstanding for years with no effort made to collect them, are now being collected by the legal department and suit instituted where debtors do not pay up at once. Warning that suit would be instituted unless payments were made, given by Assistant Corporation Counsel H. M. Dumphy, resulted in the collection of \$3,794.80 of the \$8,000.

Raw Water in New City Basins

Niagara Falls, N. Y.—Raw water has been let into two big basins at the new pumping station. Engineer W. Robbins superintended the work, and as soon as the scaffolding was taken out of the basins the valve in the intake pipe was opened and the almost pure water from near the middle of the river rushed into the basin at high pressure. The water will be allowed to settle in the basins until the electric pumps are connected, when tests will be made for several days. The pumps are not expected to be connected for another week yet.

Court Decides City May Own Water Plant

Bethlehem, Pa.—Bethlehem won an important victory when the State Supreme Court here reversed the Northampton County Court and held that the borough has the right to construct a municipal water plant. The court, however, holds in an opinion in another case effecting Bethlehem's water question that the municipal election to determine whether the indebtedness of the borough should be increased for the purpose of constructing the water works was invalid. It is held that the ballots did not comply with the requirements of the law of April 29, 1903, because the words "yes" and "no" were not printed upon them. The court holds, vitiates the election. The election case was brought by four taxpayers, while the suit involving the right of the borough to build its own water plant was brought by the Bethlehem City Water Company.

STREET LIGHTING AND POWER

Experimenting with New Lamps

Schenectady, N. Y.—As an experiment in street lighting the Schenectady Illuminating Company has recently installed 18 of the new flaming arcs on Dock street. Although this type of lamp has been used on lower State street by the business men, this is the first time they have been used for street lighting purposes in this city and they have been found very satisfactory during the two weeks they have been in operation. The lamps were installed at the expense of the Illuminating Company and the city has agreed to pay half the expense for the current in addition to the \$60 per year rental for each lamp, in accordance with the standing contract.

Rapid Progress of Municipal Plant in Lighting Streets

Richmond, Va.—Engineer E. W. Trafford, in charge of construction work for the municipal electric plant, has reported to the Council Committee on Electricity that within the next 30 days he would be ready to cut out all rented lamps save about 50 in outlying districts, the lines of the city plant not having yet reached out to embrace them. He said that he was pressing the work forward as rapidly as possible to save the double cost of renting lights and at the same time operating the power house, and for that reason had not as yet taken up the question of extending the ornamental lights westward on Broad street to Pine street, for which funds have been provided.

Favorable Monthly Report of Municipal Light Plant

Pasadena, Cal.—The February report of the general manager of the municipal electric light plant shows that the city made a net profit of \$6,225.40. Allowing for the payment of bonds, during the month of February the city cleared over \$4,500, which can be applied to the depreciation fund or to new construction.

Plan Conduits for All Wires

Pasadena, Cal.—The special committee appointed by the Mayor for the purpose of making recommendations in regard to the disposition of overhead wires made its report to the Council and recommended a municipally owned conduit system for all wires for the use of which corporations should pay in rent the equivalent of the interest and principal on a bond issue plus the cost of maintenance. The report further recommended that a commission be appointed to present in concrete form a plan to put wires underground in the business and congested districts and to establish one municipal pole line where conduits are impractical. The plan would be to have this pole line replace the half dozen present pole lines which duplicate in all parts of the city, making the streets hideous with their landscape-blocking obstruction.

FIRE AND POLICE

Fire Traps Must Be Razed

Spokane, Wash.—A score or more alleged unsanitary, unsafe and fire-trap buildings in the business district, the owners of which were successful in dodging condemnation orders of the former city administration, must be razed within 30 days, according to orders of Building Inspector John M. Goodwin. That he will attempt to enforce the penalty of \$100 a day fine and jail sentence against every owner who attempts to dodge the issue is the statement of the inspector. The buildings were condemned and ordered torn down by the former administration, but nothing was ever done when the owners refused to act.

New Hydrants Help Fight Fire

Jersey City, N. J.—Street and Water Commissioner Finke and Engineer J. W. Griffin, of the Water Department, have tested the water pressure at the new hydrants recently installed in connection with new water pipes. The test was very satisfactory. It showed that Jersey City's fire fighting ability has been greatly increased by the installation of new hydrants and water pipes. Commissioner Finke insists that the test ought to result in a further reduction of the fire insurance rates.

Fire Alarm System Installed

Placerville, Cal.—The new fire alarm system for this city is now installed. The fire bell has been moved from the Plaza to the top of Canon Hill and electrically connected with the central exchange office of the telephone company. The city has been divided into eight fire wards, and every telephone is a fire alarm box. Cards have been placed on every telephone in town, giving number of ward and directions how to sound an alarm.

Automobile Police Patrol for Emergency Use

Charleston, S. C.—The big automobile wagon of the Police Department has arrived, and is being given its final try-out. The introduction of the automobile patrol does not mean the exit of the "Black Maria." The new patrol will be used only for emergency cases, during fires or for duty in outlying districts.

City Acquires Automobile Apparatus

Bay City, Mich.—A new automobile patrol for the police has been received and will be put into commission at once. The horse patrol will not be used again.

Street Department Automobile Becomes Hose Wagon

Haverhill, Mass.—The latest acquisition to the city's fire equipment is an automobile combination chemical and hose wagon. The car is a beauty. It is the old Knox automobile purchased for the Street Department, and which was smashed up in a collision with a trolley car. It went into storage for several months at the Ward 6 engine house, but was turned over to the Fire Department a few weeks ago and by them entirely rebuilt. It now has a body which carries about 600 feet of hose with the necessary pipes and appliances, a couple of chemical tanks and has a rail and running-board. There are two seats forward, and while the new machine is small, it is, nevertheless, efficient along all lines of practical fire fighting. It will do fine service in responding to long run calls, there being plenty of power and endurance, and the apparatus is one of the city's most valuable acquisitions.

Suburbs Supplied with Fire Alarm Boxes

Oakland, Cal.—The city electric department is busily engaged in installing fire alarm boxes in the annexed district. The first lot of eight boxes are already in operation and the balance of about 25 boxes will be installed as rapidly as the shop can turn them out. An unavoidable delay in this work was caused on account of moving, as everything had to give way to that for about two weeks. The new machinery for the fire alarm shop has been received and is installed. With this machinery it will be possible to turn out a better grade of work and more per hour, thereby cheapening the product. The last shipment of electrical equipment for the fire alarm installation in the new building is received, and will be installed in the next few days. When this work is completed Oakland will have as an efficient an installation as can be found, and is far better housed and protected than any other fire alarm installation in the country, according to George Babcock, head of the electrical department.

Made-Over Chemical Apparatus Stands Tests

Bridgeport, Conn.—Thorough and successful tests of the new auto-chemical which is to be stationed at the Maplewood fire house have been made. This piece of apparatus is largely of the made-over type of which Superintendent of Machinery Tracy has done much of the work. The chemical, which formerly was horse-drawn, has been taken apart and is now mounted on a large type chassis from the Locomobile factory.

Ardmore Adds to Fire Equipment

Ardmore, Okla.—Ardmore has added to its fire fighting equipment an apparatus that would do credit to any city—a 55-horsepower auto truck and chemical engine combined. The machine has been set up, but before it is given a test the factory will send a man to demonstrate it. The truck carries six men besides the driver, and will carry 1,000 feet of hose and two ladders; the chemical tank having a capacity of 50 gallons. The machine was built by the Seagrave Company, of Columbus, O., and cost, delivered in Ardmore, \$4,600.

GOVERNMENT AND FINANCE

Mayors of All Cities to Serve Four-Year Terms

Harrisburg, Pa.—The bill fixing terms of Mayors and Select Councilmen of all cities of the commonwealth at four years and of all Common Councilmen at two, has been signed by Governor Tener. The bill was presented by Mr. Hess, Lancaster, and applies to all officials of the classes mentioned to be "hereafter elected." The repealing clause repeals all general, special or local laws inconsistent with the act.

Organization of Commission Government

Birmingham, Ala.—At the first meeting of the Commissioners under the new form of government the Commissioners agreed among themselves upon what department should be handled in detail by each of the members. The belief is official, however, that all questions such as public policy and generalities will be handled by the Commission as a whole. President Culpepper Exum will have the following departments: Accounts, finances (including public assessments for improvements), public affairs, Fire Department and the Building Inspector's department. Commissioner Lane will have charge of the following: Public Justice, Recorder's Court, City Attorney, Police Department, Health Department and the plumbing department. Commissioner Weatherly will have charge of the following: Department of streets, parks, city and public property, city and public improvements, electric department, engineering department. Twenty-nine city employees were dispensed with and a saving to the city effected of \$31,460 for the year.

Bond Issue Is Sold Locally

Houston, Tex.—The South Texas National Bank has purchased the entire issue of \$500,000 in bonds floated by the city of Houston for the purpose of constructing a steel and concrete viaduct over Buffalo Bayou at Main street. By the terms of agreement the South Texas National Bank will pay a premium of \$1,000 for the bonds. They are 4½ per cent securities, maturing at the expiration of 30 years, with a reservation by the city to call them in 10 years before expiration.

Will Ask for Bids on City Deposits

Woonsocket, R. I.—The perseverance of Mayor James Mullen in pushing the matter of getting more interest on the city's deposits has resulted in both branches of the City Council unanimously passing a resolution directing the City Treasurer to advertise for bids from local banks and trust companies for the city's deposits. The city now receives 2 per cent, the same as all other depositors on checking accounts, and Mayor Mullen pointed out that the city of Providence receives 3 per cent on its daily balances, while the city of Pawtucket receives more than 3 per cent.

Retiring Administration Leaves Enviably Record

Freeport, Ill.—At the last Council meeting of the retiring administration City Treasurer Wagner made reports for the fiscal year. His reports show that the balance of the corporate fund now in custody is \$22,029.15, not including delinquent taxes, which will bring the amount up to \$35,252.55. The amount of the fund is large for Freeport and the city's finances are in excellent shape, about \$47,000 better than at the beginning of the administration that has just closed. Starting with a deficit of over \$12,000, the administration just past has wiped out the deficit and left the treasury comfortably full. Although the administration has been economical and has left a large sum in the corporate fund, it has spent much for improvement and new equipment. The Street Department is well supplied with new wagons, etc.; the Fire Department has its new hose house in West Freeport, new wagon and equipment; the several city departments have been thoroughly reorganized on a business basis and a new accounting system has been installed. New office equipment for the City Hall has been purchased, too, and there have been various expenditures for other improvements. The city's affairs are clean and sound and the new administration is starting in with every possible advantage.

STREET CLEANING AND REFUSE DISPOSAL

City Intends to Keep Streets Clean This Summer

Wilmington, Del.—The Street and Sewer Commissioners have started an investigation with a view to improving the street cleaning. The immediate cause was complaints from the Delaware Mills that loads of debris were being dumped on the Morris Road. The directors said there were constant complaints of this sort from all over the city. Street Commissioner Pierson said city contractors had claimed it was done against their orders by irresponsible carters. It was difficult to catch any one because the carters did not do it if a policeman was around. It was obviously impossible, the directors thought, to keep a policeman on every vacant lot in Wilmington. The directors also complained that too large loads were carried, so that dirt fell off and was tracked along the streets. It was thought that might be one way to trace those who dumped loads in unlawful places. The department will take steps to make examples of some of the offenders.

Clean-Up Weeks Are Popular

Harrisburg, Pa.—Mayor Meals issued a proclamation naming the first week in May as clean-up week, and has assurances of co-operation from the Civic Club and other sources for giving Harrisburg a thorough house cleaning.

Knoxville, Tenn.—The week beginning Monday, May 15, has been designated by the Board of Public Works as "clean-up week" in Knoxville. The Police Department was instructed to notify the occupants of each house to begin "cleaning up" that day. All the city carts and wagons will be used that week to haul away the garbage. The Board also instructed the police to serve notice of the law on home owners, where there are no numbers on the houses.

City Officials Pleased with Street Flusher

Bridgeport, Conn.—Mayor Buckingham and other city officials express much satisfaction with the demonstrations of the Studebaker street flusher. It was tried on the brick pavement on Broad street, south of State street, the wood block pavement on Main street and the Belgian block pavement on Water street. The Board of Apportionment has made the appropriation for the purchase of a flusher and the various types are being demonstrated by the builders before Superintendent of Street Cleaning Schreiber decides which kind to purchase.

Board of Public Works to Put Auto Garbage Truck on Street

Manchester, N. H.—The practicability of the auto-chemical has been so clearly proved that the new Board of Public Works has decided to install a large garbage automobile truck. The new wagon will weigh upward of three tons and will have a capacity of six cubic yards at a load. This large amount with the quickness with which the auto can get about the city will allow the auto to take the place of three ordinary horse-drawn wagons, which would indicate that by its installation the city will be able in the course of the year to save a considerable sum of money. The saving is estimated to be such that the truck will pay for itself in the course of its life and in that time the scavenger service will be by its use greatly improved. It is the intention of the Board to use the new machine in the congested parts of the city. The probable cost of the truck will be in the neighborhood of \$3,400. Several representatives of the different automobile firms have been either in communication with the Board or appeared in person with illustrations of the trucks, and while it is an assured fact that the Board is to purchase one, the exact model has not yet been decided upon. It is understood, however, that the machine will be similar to that adopted in many of the large cities throughout New England, and will be in operation by the last of the month. It is anticipated that before the spring "housecleaning" has been completed the machine will have done its part in the important work. In an interview with Chief Engineer Samuel Lord it was learned that the residents of the city are responding most gratifyingly to the call of the department for cleaning up of the winter refuse, but there are still a great many who have not as yet done so. All the garbage teams are patrolling the city for this purpose, and will be kept at the work until every nook and corner has been taken care of.

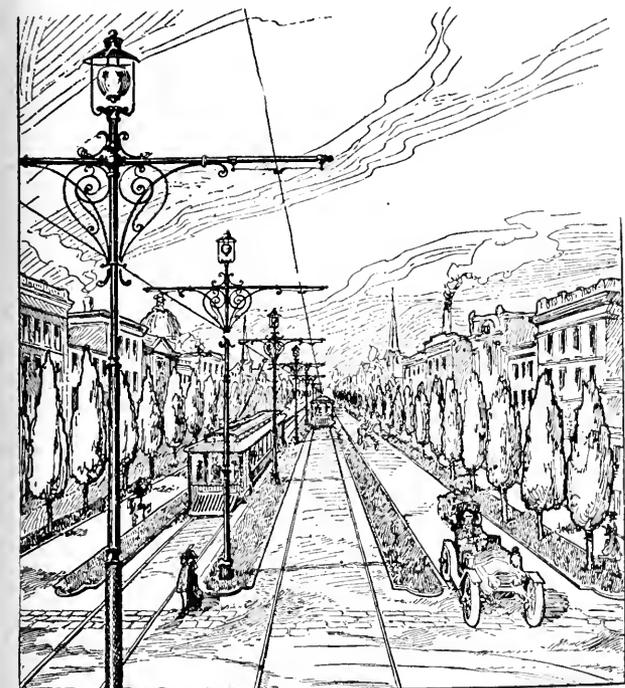

RAPID TRANSIT

Franchise Is Refused

Brownsville, Tex.—The application of the Brownsville & Gulf Railway for a franchise to broaden the gauge of its tracks on Twelfth street and to operate a motor car line between Brownsville and Matamoros has been denied by the City Council. The company's tracks run through the heart of the city and have not been used for years. The City Council recently declared the tracks to be a public nuisance and instructed the City Marshal to abate the same. A majority of the Councilmen held that to grant the Brownsville & Gulf a franchise on Twelfth street would preclude the securing of a street railway system throughout the city later. However, a resolution was introduced offering the company a franchise to operate a motor car system over the whole of the city.

Plans of San Francisco's Municipal Street Railroad

San Francisco, Cal.—Commissioner Charles S. Laumeister of the Board of Public Works, who has charge of the details of the construction of the city's Geary street railroad, intends having ornamental trolley and lighting

Courtesy San Francisco Chronicle.

PLAN OF ORNAMENTATION FOR SAN FRANCISCO'S MUNICIPAL RAILROAD

poles and grass plots, as shown in the illustration, on that portion of the road from Point Lobos avenue to the beach. Geary street is too narrow to admit of such ornamentation. The contracts for constructing the road and building the cars will be let in about a month.

Council Renews Franchise

Quincy, Ill.—The City Council has renewed the franchise of the St. Louis, Terre Haute & Quincy Traction Company. The new features incorporated in the ordinance are as follows: No franchise license shall be exacted for the first 10 years of the 50-year franchise; on the following five years \$10 a year per car shall be required; five years still later a flat cash license of \$500 shall be required, and at the expiration of the last five years a flat license of \$1,000 a year shall be required for each year during the remainder of the life of the franchise. Some concessions are also made in the payment of street pavement. A former ordinance required a cash license of \$20 per car for each year of the franchise operated within 100 miles of Quincy. It is generally known what the route of the proposed line is in the city limits: It starts at Twenty-fourth and Spring; runs west to Eleventh street; south to York; west to Sixth; north to Vermont; east on Vermont to Eleventh, completing the city loop.

MISCELLANEOUS

City to Insure Boilers

Providence, R. I.—The city will insure 18 of its high-pressure boilers against explosion and accident. This action, which is a radical departure from the custom of the past, was decided upon by the committee on city property as a measure which would prevent the city from becoming liable in case of any accident due to a boiler defect.

New Method of Street Marking Adopted

Walla Walla, Wash.—With the building of new walks throughout the city, all of which are to be concrete, a plan of marking the streets has been adopted that will prove useful to Walla Wallans, as well as strangers, in finding their way about the city. The names of the streets are being marked in the walks at the corners before the concrete hardens, and when the walk is completed the name of the street is written so that it may be easily read. Those who know Walla Walla best are oftentimes at loss for their bearings, so crooked are the streets, and so various the angles and directions. So the new move for marking them is being met with approbation everywhere.

Richmond Adopts Segregation Ordinance

Richmond, Va.—Mayor Richardson has approved the Von de Lehr ordinance providing for the domiciliary segregation of the negroes of the city, thus making it a law. Along with it goes an ordinance, as yet incomplete, providing for the annexation of territory to the negro quarter and the furnishing of sewerage, lights and other improvements necessary to health and comfort so that there need be no undue crowding of the negro population.

Ask State Aid in Protecting Harbor

Natchez, Miss.—Congressman William A. Dickson, attended by a delegation of 60 business men and bankers, appeared before the Mississippi River Commission here last week in behalf of the claim for protection for the local water front. City Solicitor Martin presented the memorial from the Board of Mayor and Aldermen. The Board of Mayor and Aldermen submitted resolutions to the Commission, and the petition from the Chamber of Commerce, Retail Merchants' Association and Board of Supervisors was read by Congressman Dickson. The petition asks the Commission to make such allotment out of the funds at its disposal as to provide for the immediate and adequate protection of the Natchez front, or harbor, from further encroachment by the Mississippi River.

New Law to Protect Trees

Wilmington, Del.—The Board of Directors of the Street and Sewer Department wish particularly to call the attention of the public to the fact that nobody in the city has the right to remove, plant or trim trees in the city streets without permission from the department, according to the new law passed by the Legislature giving absolute control over trees in the city streets to the Street and Sewer Department.

Citizen Donates Land for Park

Morristown, N. J.—Thirty acres of land to be used for park purposes have been presented to the city by Frederick G. Burnham. The tract is particularly suitable for park purposes, containing the three well-known Mills ponds and the fine woods surrounding them.

Town to Have New Park

Muncie, Ind.—Muncie is to have another new park and rest ground. Under the supervision of the Board of Park Trustees work was begun to make a park out of the tract of ground lying along the Fort Wayne, Cincinnati & Louisville Railroad, east of Madison street, from Gilbert to Wysox street.

Will Enforce Ordinance Regulating Height of Awnings

Haverhill, Mass.—City Marshal Mack has ordered an inspection of awnings, and in sending it out he directed that the owners of awnings be notified of violations of the ordinances, and in the event of failures to remedy conditions, that complaints be made in court.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Reasonable Use of Street—Moving Building

Western New York & Pennsylvania Traction Company vs. Stillman.—Vested rights of a street railroad company to the use of a city street are subject to the reasonable use of the street for travel and other purposes. Whether the moving of a private building through a city street under permit from the city is a reasonable use of the street is a question of fact and usage in each particular case. Where a street railroad company sues to enjoin interference with its wires and overhead construction by a person moving a building through a city street, and alleges irreparable injury, it has no ground for complaint when the order vacating the temporary injunction provides that the work of taking down and replacing its wires shall be done by its own employees, and that defendant shall pay the expenses.—Supreme Court of New York, 128 N. Y. S., 363.

Streets—Injuries—Negligence

O'Connor vs. City of Dunkirk.—A gutter ran down the side of a street, and the crosswalk was elevated above the bottom of the gutter from $2\frac{3}{8}$ to $5\frac{1}{2}$ inches, and there was a break between the end of the crosswalk and the sidewalk, leaving a space of $10\frac{1}{2}$ inches over the gutter, over which space pedestrians were required to step in reaching the sidewalk. Plaintiff in the daytime, instead of stepping over such space, stepped into the gutter, which was filled with snow, ice, water and dirt, but was not sufficiently frozen to hold her weight, though it appeared to be so, and was injured. Held, that the city was not negligent for allowing the gutter to fill up with material not sufficiently solid to bear a pedestrian who stepped into, rather than across, the gutter. Where, in an action against a city for injuries by stepping into the gutter, the court ruled that it was not negligence for the city to so construct the crosswalk as to leave a $10\frac{1}{2}$ -inch space between it and the sidewalk over the gutter, and that the only basis of recovery was permitting the gutter to fill up with semi-solid matter, evidence of a resolution passed by Council some days before the accident to the effect that the Council regarded the gutterway as dangerous on account of the openings left between the sidewalk and the crosswalk was not admissible.—Supreme Court of New York, 128 N. Y. S., 398.

Contracts for Public Work—Quantum Meruit

F. V. Smith Contracting Company vs. City of New York.—Greater New York Charter provides that contracts for work for the city shall be made by the appropriate borough president or heads of departments under regulations established by the Board of Aldermen, and that work necessary to complete a particular job or supplies needful, which shall involve expenditure of over \$1,000, shall be furnished by contract with the appropriate borough president and heads of departments. Section 149, as amended in 1901, provides that no claim against the city for work done or material furnished with immaterial exceptions shall be paid unless an auditor of account shall certify that the charges are just and reasonable, and if, in an action against the city on a claim, not embraced in the exceptions, the amount claimed by plaintiff is in excess of the amount so audited, it must be established by competent evidence. Held, that a contract by a department without public letting is equivalent to an agreement to pay quantum meruit, and the specification of a price can be deemed only a maximum limitation raising no presumption in favor of the contractor as to the value of his services. Such a contractor need not postpone action upon his claim until it shall have been audited; but, when 30 days have elapsed since filing of his claim with the Comptroller, if it has not been acted upon, he may sue, alleging the contract price and assuming that it would be found moderate by the auditor, and in such an action the city need not affirmatively plead that the auditor has audited adversely to the claim, but may plead a general denial, and at the trial object to plaintiff's proof of the claim.—Supreme Court of New York, 128 N. Y. S., 351.

Annexation—Propriety

State ex rel. Simpson, Atty. Gen., vs. Village of Dover et al.—Whether unplatted territory, included within the limits of a village corporation, is so conditioned as properly to be subject to village government is a question of fact to be determined by the voters entitled to vote upon the question, and their decision cannot be disregarded unless it clearly appears to have been the result of arbitrary action. It does not conclusively appear from the evidence that the unplatted territory of the objectors, incorporated in the village of Dover, was included for the purpose of exacting revenue for village purposes and without regard to its adaptability to village government.—Supreme Court of Minnesota, 130 N. W. R., 75.

Assessments—Manner of Review

Durst vs. City of Des Moines et al.—Code provides that all objections to assessments for street improvements not made before the council shall be deemed waived, and Section 839 permits one affected by the levy of a special assessment to appeal to the district court and provides that upon such appeal all questions touching the validity of the assessment shall be determined. Held, that the objection that an assessment exceeded the amount prescribed by Code Supp. 1907, providing that an assessment shall not exceed 25 per cent of the actual value of the tract, the last preceding assessment to be prima facie evidence of such value, must be made before the City Council and an appeal taken to the district court from an adverse determination, and hence an owner may not ignore such remedy and bring an independent suit in equity to obtain relief from the assessment.—Supreme Court of Iowa, 130 N. W. R., 168.

Sewers—Assessments—Abatement

Granite State Land Company vs. Town of Hampton.—Under Public Statutes, 1901, authorizing towns and village districts to adopt the chapter authorizing the Mayor and Aldermen of any city to construct sewers they adjudged necessary for the public convenience and health, and Laws 1883, providing that, where the chapter is adopted by a village precinct, the Selectmen of the town in which the village precinct is situated shall perform all the duties conferred on the Mayor and Aldermen in case of cities, the Selectmen of a town which has adopted the chapter may exercise the powers conferred within the territorial limits of a village district organized under chapter 53, providing for the organization of village districts, with power to construct and maintain sewers, where the district has not voted to adopt the chapter, and has not taken any action as to the construction of sewers; the powers conferred by chapter 79 and by chapter 53 not being conflicting. Assessments for the construction of sewers levied on the lands benefited thereby are a legal exercise of the taxing power, and must be justified on that ground alone, though such an assessment is not a tax imposed for the expenses for public purposes in which all are interested, and though it is merely the division of the expenses of an improvement which renders property more valuable in the ratio of the increase of such value. An assessment under Public Statutes, 1901, authorizing an assessment on lands receiving special benefits from the construction of a sewer, for their just share for the cost of construction and maintenance, etc., recognizes the ownership of buildings on lands of another, and buildings so situate are real estate for the purposes of assessment, and are properly assessed to the owner thereof such buildings being "lands." Under Public Statutes, 1901, authorizing one aggrieved by the refusal to abate a tax to petition the Supreme Court for an abatement, a tax invalid because assessed against a person not the owner is not abated on the petition of the owner, because justice requires that he shall be taxed for the value of his land, and the relief to which he is entitled is such as is equitable. A town leased its land for an annual rent for a long term of years. The lessee sublet to a third person on a like rent under a lease which had 17 years to run. The Selectmen of the town constructed sewers benefiting the land. Held, that the third person was properly assessed for his benefits resulting from the construction of the sewer, and, where he was assessed for the whole title, he was entitled to an abatement, so that the fair share of his interest would only be assessed against him.—Supreme Court of New Hampshire, 79 A. R., 25.

Public Improvements—Reducing Assessments

Camp vs. City of Davenport.—Where, on appeal from a special assessment, there is evidence that no benefit was derived and there was other evidence that the property was benefited, but there was no evidence to show the extent of the benefit conferred, it is error to reduce the assessment fixed by the City Council.—Supreme Court of Iowa, 130 N. W. R., 137.

Dumping Ground—Negligence—Liability

Brennan vs. City of Albany.—Where the defense of ultra vires is interposed by a municipal corporation to a contract obligation, it must be pleaded to be available. The liability of a principal for the act of his agent, which is beyond actual authority, can be based on apparent authority only where such apparent authority has misled the other party. Where private land was lawfully used by a city for a dumping ground, it was liable for the negligence of its employees in so piling refuse that surface water which would otherwise have escaped through a sewer flowed onto and damaged adjoining property.—Supreme Court of New York, 128 N. Y. S., 334.

Defects in Streets—Actions—Negligence

Heffern vs. Village of Haverstraw et al.—Where a city and one who excavated land near a highway were jointly sued for damages caused by the slide of the highway into the excavation, and the city's only negligence was non-performance of its duty to keep the highway in a safe condition, a finding that the one who made the excavation was not negligent necessarily exonerated the city. Where one in a place of safety, on hearing that there was a slide into an excavation with which he was familiar, went near that place from curiosity, and the land slid again, drawing down the street upon which he was standing, he was guilty of contributory negligence, barring a recovery against the city for his injuries.—Supreme Court of New York, 128 N. Y. S., 399.

Sewer Contract—Substantial Performance.

City of St. Louis vs. Ruecking et al.—The doctrine of substantial performance applies to municipal sewer construction contracts. In an action on the bond of municipal contractors, whether substitution of loose earth for sand in laying sewer pipe under a municipal construction contract was substantial compliance with the contract held, under the evidence, a jury question. Under a provision requiring a municipal sewer contractor to correct imperfect work when discovered before final acceptance, there can be no recovery by the city for defects discovered after such acceptance, in the absence of fraud or collusion. A city ratified its agents' unauthorized acts in permitting substitution of earth for sand in laying pipe under a sewer contract by accepting and paying for the work, in the absence of fraud or collusion by the agents.—Supreme Court of Missouri, 134 S. W. R., 657.

Contempt of Federal Supreme Court

Merrimack River Savings Bank, Appellant, vs. City of Clay Center et al.—The willful destruction by municipal officers of the poles and wires of a light and power company, pending an appeal to the Federal Supreme Court from a decree of a Circuit Court, dismissing a bill praying, among other things, an injunction to prevent such destruction until the right shall be determined, is, in and of itself, a contempt of the appellate jurisdiction of the Supreme Court, although such conduct may also be a violation of the temporary injunction order continued by the court below pending the appeal. The honest belief that when an appeal to the Federal Supreme Court from a decree of a Circuit Court, dismissing a bill asking injunctive relief against the removal or destruction by municipal officers of the poles and wires of a light and power company, had been dismissed and an order of dismissal entered, there was no reason why such poles and wires should not be removed or destroyed, although not sufficient to acquit of a technical contempt of court where no mandate had issued or could have issued under the rules of the Supreme Court, may reduce the punishment to the payment of the costs of the contempt proceedings.—31 S. C. R., 295.

Icy Sidewalk—Injuries

Ballard vs. Village of Hamburg.—A municipal corporation is not liable for injuries caused by an icy sidewalk, unless it is shown that the injuries were caused by hummocks or ridges of ice which had accumulated and were then permitted to remain for some time after the weather was such as to permit their removal.—Supreme Court of New York, 128 N. Y. S., 325.

Public Parks—Land Condemnation

Lake Shore & Michigan Southern Railway Company vs. City of Whiting.—Since Laws 1905, providing for the condemnation of land for public parks, provide that the repealing provisions shall not affect pending proceedings, but that they shall be concluded and judgment rendered, Laws 1905, giving a right of appeal from an interlocutory order appointing appraisers, would not authorize an appeal from an order appointing appraisers in proceedings to condemn land for a public park, where the appraisers were appointed and had filed their report more than a year before Laws 1905 became effective.—Supreme Court of Indiana, 94 N. E. R., 326.

Patrolmen—Dismissed—Action for Salary

Dolan vs. City of Louisville.—A city board of public safety may not dismiss a patrolman for conduct unbecoming an officer, alleged to have been committed two years prior to his becoming a member of the force. In an action by a patrolman to recover salary for the year subsequent to his illegal removal from the force, the burden is on him to establish his title to the office against the person succeeding him therein, or show that the office remained vacant during the year, and that the salary was not paid to any other person, or that he instituted proceedings against the Board of Public Safety for reinstatement. In an action for salary of a patrolman for the year succeeding his wrongful discharge, evidence held insufficient to show that there was a vacant place on the police force during the period sued for.—Court of Appeals of Kentucky, 135 N. W. R., 272.

Ordinances—Passage—Validity

Elliott vs. Monongahela City et al.—A municipal corporation can only exercise such powers as are granted it by the State, and only in the manner prescribed in its charter or by act of the Legislature creating it. The Monongahela city charter vests the corporate powers of the city in a Mayor and City Council. Section 62 provides that the Council shall be composed of the Select and the Common Council. Section 67 provides that a majority of each Council shall be a quorum. Section 68 provides that they may, when convenient, hold joint sessions, and section 69 provides that no appropriation of money and no ordinance shall be of any force unless concurred in by the Councils. Held, that an ordinance authorizing the city officials to contract for lighting and fixing the price to be paid for such service passed at a joint session by a majority of the collective body, but, failing to receive the approval of the majority of one of the branches separately, is void.—Supreme Court of Pennsylvania, 79 A. R., 144.

Contract for Public Work—Substantial Performance

St. George Contracting Company vs. City of New York.—The plaintiff had a contract with the city for excavation, which provided that all top soil and hardpan should be deposited as filling back of the completed wall, and that, should there be an excess of excavated material, the contractor should remove it at his own expense. After the contract was signed, and before plaintiff began work, a railroad company by mistake entered upon, excavated and carried away top soil amounting to about one-tenth of the measurement called for by plaintiff's contract, and the city on completion of the contract refused to pay plaintiff for this amount. Plaintiff, in an action to recover therefor, offered no proof that the material carried away was excess material not needed for filling. The evidence of the city tended to show that it had to purchase filling to back the wall, and plaintiff's evidence tended to show that defendant's damage thereby was only nominal. Held, that plaintiff had not sustained the burden of proving substantial performance, and had no case against the city.—Supreme Court of New York, 128 N. Y. S., 393.

MUNICIPAL APPLIANCES

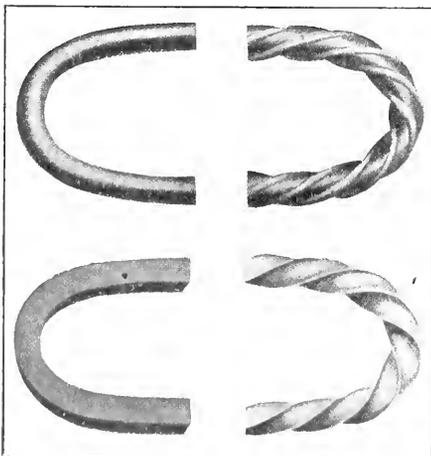

STEEL REINFORCEMENT FOR CONCRETE SEWERS

The general argument in favor of the use of steel as a reinforcement for concrete is as follows: The compressive resistance of concrete is about ten times its tensile resistance, while steel has about the same strength in tension as in compression. Volume for volume steel costs about fifty times as much as concrete. For the same sectional areas steel will support in compression thirty times more load than concrete, and in tension three hundred times the load that concrete will carry. Therefore, for duty under compression only, concrete will carry a given load at six-tenths the cost required to support it with steel. On the other hand, to support a given load by concrete in tension would cost about six times as much as to support it with steel.

In sewer construction the exact value of reinforcement cannot be stated in general terms applicable to all cases. The amount of the load on the sewer and stresses developed in different parts of the ring depend upon a number of conditions, among them the nature of the earth used in filling, the method of bedding the pipe, the way of tamping the earth on the pipe. Moreover, a sewer may be under pressure or may be so located as to need special strengthening. The question of whether a sewer requires reinforcement or not, and if so, what kind, has to be left to the engineer to work out in each instance.

The reinforcement for sewers may consist of circumferential rods in the form of hoops or spirals. Longitudinal rods, either inside or outside the hooping, depending upon whether the pressure is from within or without, and wired to the hooping, are often employed. Various forms of netting and expanded metal are also extensively used.

Steel imbedded in properly proportioned and mixed concrete is believed to be practically indestructible by such agencies as it is exposed to in a sewer. This fact has been demonstrated in a series of tests by Professor Norton, Massachusetts Institute of Technology. He advises the use of thoroughly mixed wet concrete.

ROUND, SQUARE, SPIRAL AND TWISTED BARS

BANDS, SQUARE AND ROUND RODS

While the adhesion between iron and steel is considerable, it may be weakened by various agencies, such as water; consequently some sort of mechanical bond is generally preferred. This is secured by making the bars of special shapes, as by the use of corrugations or twisting. Hence the plain bands and square and round rods have a limited use. Some engineers have objected to the use of square or flat sections on the ground that the sharp re-entering angles formed in the concrete weaken it and induce cracks to start from the angle when subjected to loads or shocks.

In selecting steel for sewer reinforcement not only the form of the steel, but its quality has to be considered. In the following account of the manufactures now on the market substantially the argument of the maker is presented in each case.

Plain steel bars, flat, square and round, are made by all manufacturers of steel. They have a limited use in sewer construction. Flat bars are, however, often used in the construction of sewer pipes which are made before they are put in place, as in Jackson pipes. Authorities differ as to the quality of steel to be used for reinforcement, soft, medium and high-carbon steel being used by different engineers. According to Homer A. Reid, the preference seems to be for soft or medium steel. Open hearth steel is preferable to Bessemer. Open hearth steel, either acid or basic, should conform to the following requirements: The maximum limit of phosphorus in the finished material should not exceed .07 per cent for acid and .05 per cent for basic open hearth steel. Soft steel should have an ultimate strength of from 54,000 to 62,000 pounds, and an elastic limit of not less than one-half the ultimate strength; it should elongate 25 per cent in 8 inches, and bend cold 180 degrees flat on itself without fracture on outside of bend. If medium steel is used, it should have an ultimate tensile strength of from 60,000 to 68,000 pounds per square inch, an elastic limit of not less than one-half the ultimate strength, and should elongate not less than 22 per cent in 8 inches, and bend cold 180 degrees around a diameter equal to the thickness of the piece tested, without fracture on outside of bend. If high steel is used it should have a tensile strength of 100,000 pounds per square inch, and an elastic limit of not less than one-half the ultimate strength, and should elongate not less than 10 per cent in 8 inches for a test piece $\frac{3}{8}$ to $\frac{3}{4}$ inch in diameter. A test piece $\frac{1}{2}$ inch in thickness should bend 110 degrees without fracture around a diameter equal to its thickness.

REINFORCING BARS

Twisted Bars.—Steel bars twisted cold are the invention of E. L. Ransome. Square bars are usually employed. The twisted form gives a firm grip on the concrete, thereby greatly assisting the adhesion between the two materials. The process of cold twisting also cleans the bar by removing scale, thus increasing its adhesion to concrete. Square bars may be twisted on the work by a simple apparatus. The operation of twisting the rods cold modifies the qualities of the metal, raising the elastic

limit and ultimate strength. Half-inch bars generally have three twists per linear foot.

The Inland Steel Company makes cold twisted medium open hearth steel billet bars in 60-foot lengths. Their elastic limit is given as 55,000 to 60,000 lbs. per sq. inch. Sizes run from $\frac{3}{8}$ inch to $1\frac{1}{2}$ inch. The company controls the manufacture of its product from ore to finished bar. The same company makes hot twisted, high elastic limit, rail-carbon bars in 10 to 40-foot lengths. The elastic limit is given as 50,000 pounds or over. These bars have one twist in eight diameters of the bar.

William B. Hough Company manu-

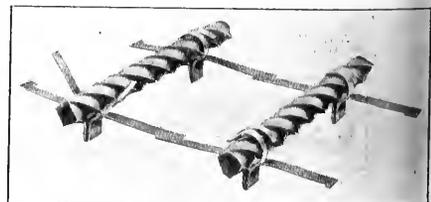

HOUGH SPECIAL METAL TWISTED BAR

ufactures the M/B cold twisted steel bar having an elastic limit of 60,000 pounds yet capable of being bent double when cold. The high elastic limit and great ductility of these bars are said to be due to the fact that they are made from a special open hearth steel. High elastic limit in ordinary steel is obtained only by the presence of a large percentage of carbon, the result of which is brittleness. The percentage of carbon in the M/B bar is not high.

Jones and Laughlin Steel Company also manufactures cold twisted bars and control the manufacture from ore to finished product. The elastic limit of these bars is stated to be 60,000 pounds and they will bend around a diameter three times the size of the section. The effect of twisting in improving the qualities of the bar is well illustrated in a series of tests given in one of the company's pamphlets. The data regarding the tests of a $\frac{3}{8}$ -inch bar are quoted: Elastic limit, before twisting, 39,130; after twisting, 71,160; increase due to twisting, 82 per cent; tensile strength before twisting, 61,180; after twisting, 85,380; increase due to twisting, 39 per cent. Attention is called to the fact that in twisted bars a greater variety of sizes is available than in the case of any other concrete bar. The company manufactures all sizes from $\frac{1}{4}$ inch to $1\frac{1}{2}$ inch, increasing by sixteenths, in lengths up to 40 feet.

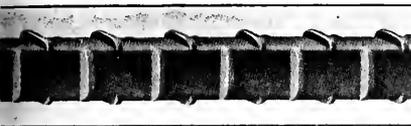

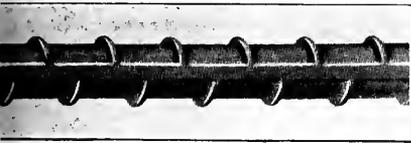

The Hough company makes a spacer called Securo, which accomplishes three purposes. It holds the bar in position at the correct distance from the surface of the shell; it locates the bar evenly and accurately at the specified distances from center to center. The prongs of the spaces when bent over the bar clasp it in a viselike grip, leaving positively no chance for slipping or sliding.

SECURO SPACER

The Buffalo Steel Company makes twisted bars besides special shapes described later. The company states that the elasticity is neither rolled nor twisted into their bars. It is in the steel, they say, and heating to forge, to bend or shape will not alter it. The twisting is done as the finished bars come from the rolls. Enough heat remains to allow the full mechanical effect of twisting without destroying the homogeneity of the steel. The process is claimed as a specialty.

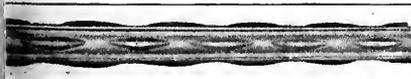

Shaped Bars.—The Corrugated Bar Company manufactures square bars with corrugations on all four sides and round bars also with corrugations. The square bar of this type was developed in 1898 and the round bar only a few years ago. The round bar has the advantage of the greatest possible flexibility; its shape allows of bending being done without the use of special machinery or particular preparation. These bars are rolled in medium, soft or high

ROUND AND SQUARE CORRUGATED BARS

carbon steel. The company furnishes, upon special order, bars made from "rail carbon" steel. These bars are made from railroad rails, the rail being split and the head rerolled into the finished bar. Material of this type is, of course, subject to irregularity in chemical and physical characteristics due to the fact that the raw material is secured from a number of sources. However, owing to improvements in the manufacture of rails the rail carbon bar is a material much superior to that rolled a few years ago and is perhaps equal to much of the billet stock material sold for commercial purposes.

The Concrete-Steel Company makes the Havemeyer bars which have been designed to meet the requirements of mechanical bond and at the same time the important economical requirement that in the deformation no strength or metal is wasted. The deformations are so designed that a constant cross-sectional area is maintained. The square bar has a series of projections and depressions in conjunction with the plain square section of the bar, the projections on the sides equaling the depressions on the corners. The round bar has projections staggered on alternate sides, giving the same result. The pro-

ROUND AND SQUARE HAVEMEYER BARS

jections and depressions are rolled longitudinally with the bar. The absence of sharp angles, which tend to break the concrete, is claimed as a special merit. The bars may be rolled from any merchantable quality of steel. Unless otherwise specified they are rolled from high-grade, new billet steel, having an elastic limit of 50,000 to 65,000 lbs. per square inch.

RECTANGULAR RABBIT BAR—HAS NO SHARP CORNERS

The Buffalo Steel Company, in addition to the bars heretofore mentioned, makes spiral and rabbet bars. They have round corners, insuring the concrete from splitting, and a greater superficial area than square twisted bars, giving greater adhesion. Rabbet steel bars, with their corrugations and well balanced cross sections, have a greater transverse strength than plain bars.

SHEET REINFORCEMENT

Expanded Metal.—Expanded metal invented by J. F. Golding is a form of reinforcement in which a perfect union exists between the longitudinal and transverse systems of rods. It is a meshwork formed from a sheet of soft steel by slitting and opening or expanding the metal with meshes in a direction normal to the axis of the sheet. It is necessary to use a soft steel of very high quality in its manufacture, as only the highest quality of metal will stand without rupture the process of expanding, which stretches the sheet to a width of from three to eight times its original dimensions. It is manufactured in sheets 8 feet long and from 12 to 72 inches wide. Steel from No. 27 gauge, with 3/8-inch meshes, up to No. 3 steel, with meshes 5 inches by 12 inches, is used in the manufacture of expanded metal. The mesh most frequently used in sewer work is 3-inch mesh, No. 10 gauge steel.

The following table gives the data regarding standard expanded metal mesh.

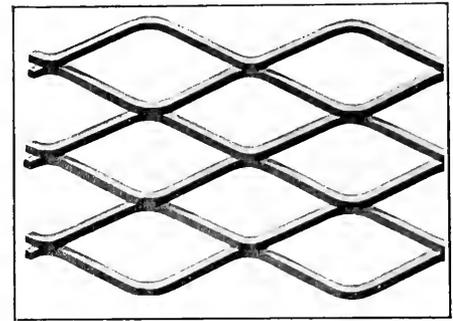

Mesh	Designation		Size of Mesh.		Section in Sq. Inches Per Foot of Width.	Weight per Square Foot in Pounds.
	Gauge (Stubs).	Strand, Standard or Extra.	Width of Diamond.	Length of Diamond.		
3"	No. 16	Standard	3.0"	8.0"	.083	.28
3 1/4"	" 10	Light	" "	" "	.148	.50
3 1/2"	" 10	Standard	" "	" "	.178	.60
3 3/4"	" 10	Heavy	" "	" "	.267	.90
3 1/2"	" 10	Ex. Heavy	" "	" "	.356	1.20
3 3/4"	" 6	Standard	" "	" "	.400	1.38
3 1/2"	" 6	Heavy	" "	" "	.600	2.07
4"	" 16	Old Style	3.86"	6.85"	.093	.42
6"	" 4	Standard	6.0"	16.0"	.245	.84
6"	" 4	Heavy	" "	" "	.368	1.26

Expanded metal as described is made by a number of companies joined in the Association of Expanded Metal Companies. They include the Northwestern Expanded Metal Co., Chicago; Central Expanded Metal Company, Pittsburg; Eastern Expanded Metal Company, Boston; Expanded Metal Engineering Company, New York; St. Louis Expanded Metal Fireproofing Company, St. Louis; Southern Expanded Metal Company, Washington, D. C.; Merritt & Company, Philadelphia; Buffalo Expanded Metal Company, Buffalo; Expanded Metal Fire-

proofing Company, Pittsburg; Western Expanded Metal and Fireproofing Co., San Francisco, and the Expanded Metal and Fireproofing Co., Limited, Toronto, Ontario.

In sewer construction expanded metal should be placed with the length of the diamond on the circumference. It has been placed in a number of sewers with the diamonds parallel with the bore, but such reinforcement is not economical. The following table contains data for the proper use of expanded metal in sewer construction:

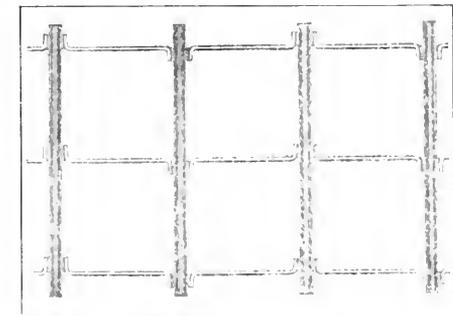

Inside Diameter.	Thickness of Concrete.	No. of Expanded Metal.	Inside Diameter.	Thickness of Concrete.	No. of Expanded Metal.
2' 6"	3"	15-3	5' 0"	4"	30-3
3' 0"	3"	20-3	5' 6"	4 1/2"	30-3
3' 6"	3"	20-3	6' 0"	5"	35-3
4' 0"	3"	25-3	6' 6"	5 1/2"	35-3
4' 6"	3 1/2"	25-3	7' 0"	6"	40-3

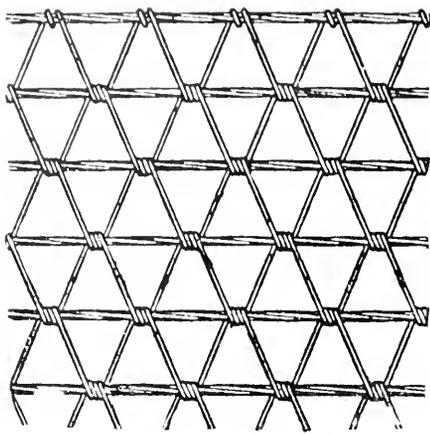

EXPANDED METAL

Special Sheet Reinforcement.—Rib metal is made by the Trussed Concrete Steel Co. It consists of a series of straight ribs or main tension members rigidly connected by light cross ties formed from the same sheet of steel. The main ribs are in the direct line of the greatest strain, while the cross members thoroughly reinforce the concrete against shrinkage or settlement cracks. The material is supplied by the manufacturer in either straight or curved sheets to meet every possible condition of sewer construction. Accuracy of curves is assured, as the sheets are machine bent. Owing to its rigidity and stiffness rib metal stays in the forms where placed and cannot be dislodged in the pouring of the concrete. The large open mesh permits the concrete to be readily tamped on all sides of the steel.

Triangle mesh reinforcement is made by the American Steel and Wire Company. It is used by those companies manufacturing reinforced concrete pipe which is made alongside the work and after the concrete is set lowered into

RIB METAL

TRIANGLE MESH

the ditch. These companies are the Lock Joint Pipe Company, the American Concrete Company and the Reinforced Concrete Pipe Company.

Triangle mesh woven wire reinforcement is made with either solid or stranded longitudinal members, properly spaced by means of diagonal or cross wires so arranged as to form a series of triangles between the longitudinal or tension members, the longitudinal members being invariably spaced 4 inches apart, the cross wires either 2 inches or 4 inches, as desired, providing either a 2-inch or 4-inch mesh. The wires are of cold drawn steel, possessing, it is stated, from 25 to 60 per cent greater tensile strength than hot rolled products of the same area. The longitudinal members may consist of one, two or three wires in the following sizes: Nos. 4, 5, 6, 8, 10 and 12½, or a ¼-inch wire used singly. Cross wires are either 12½ or 14 gauge on 2-inch or 4-inch centers, and the material is regularly supplied in widths from 18 inches to 58 inches, varying by steps of 4 inches and in rolls 150, 300 or 600 feet in length.

The Unit System of Reinforcing is made by the American System of Reinforcing, Chicago, Ill. This high tensile steel fabric is made of special steel claimed to have twice the tensile strength of any other woven material on the market. It is ductile enough to wrap around itself three or four times. Adjoining widths of fabric are fastened together by hooks. This makes it unnecessary to overlap the fabric. The

following gives the result of tests of Unit fabric made by Prof. A. N. Talbot:

	Area Sq. In.	Ultimate.	Elast. Limit. Sq. In., Lbs.	Ultimate Sq. In., Lbs.
On 8 tests on No. 9 wire, average.	.017	2450	124,000	146,000
On 8 tests on No. 11 wire, average.	.010	1230	118,000	140,000

The American company calls attention to the fact that their reinforcement affords more surface to the concrete grip than large rod reinforcement.

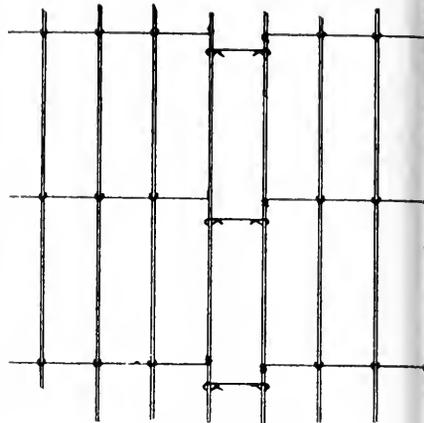

FLUSHING TANKS

The Pacific Flush Tank Company, Singer Building, New York, N. Y., has employed in the past three methods of flushing two or three lateral sewers from one tank. The first uses a single standard Miller siphon dividing the discharge outside the tank by a V branch or double Y branch into two or three streams as the case may be. The second employs a single special Miller siphon which discharges contents of tank directly into a manhole and flushing the two or three laterals converging into same. The third method uses a two-way discharge Miller siphon located in a flush tank, the siphon having a discharge head with two outlets. As the water in each of the above methods is used to flush the two or all three sewers at the same time, each tank must be two or three times the capacity of a flush tank to flush a single sewer.

A fourth method is the latest and best and does not require any larger tank than a single flush tank, as the different sewers are flushed in rotation, each lateral receiving in its turn the entire contents of the tank. To accomplish this, two or three (as the case may be) Miller-Adams alternating siphons are set into one tank, each siphon being connected with its respective sewer. The accompanying illustration shows the triple alternating design. In this device the bells and traps are so arranged as to allow them to flush in rotation.

STARY TANK

F. Stary & Sons, Cedar Rapids, Ia., manufacture an automatic siphon for use in connection with a sewer flush tank. It consists of but three plain castings, the discharge limb and trap, the cap with a relief trap cast integral

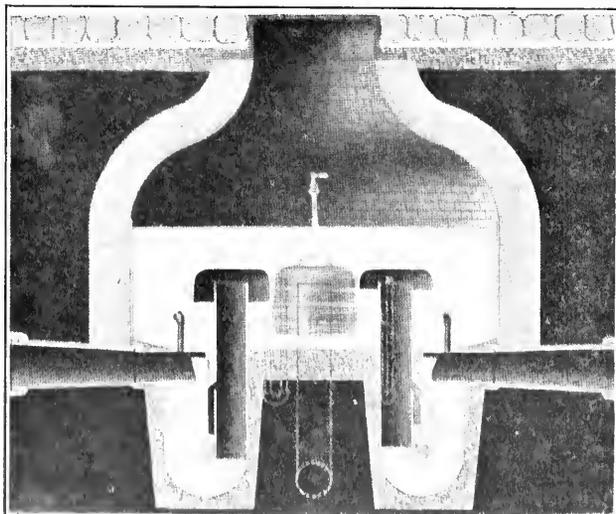

THE UNIT SYSTEM

therewith, and the intaking limb or bell. It has no moving parts and no joints. The siphon is sealed by filling the trap with water. When the water entering the tank rises above the level of the lower edges of the intaking limb or bell the air within becomes enclosed. A continued rise of the water in the tank compresses the air confined within the siphon and this compression gradually forces the water from the traps until the water in the tank has reached sufficient depth to draw the liquid seal whereupon the confined air suddenly escapes and the water from the tank rises in the bell bringing the siphon into full action. The water is then drawn out of the tank to a level with the lower edges of the bell, the siphon is reverted by admission of air through the shallow relief trap and the operation is repeated.

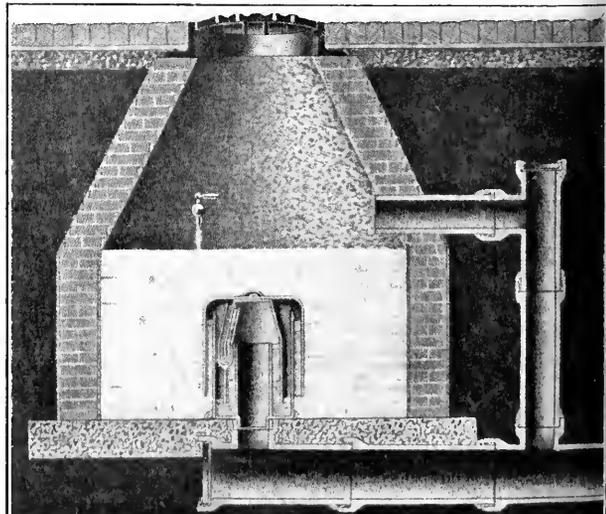

The instructions for installing the flush tank, as given by the company are as follows:

The excavation for the tank shall be opened so that the last pipe laid in the line of sewer, which may be either a T branch, ¼ curve, or a tapped length of straight pipe, shall form an outlet from the center of the bottom of the tank. This outlet shall be of sufficient size to receive the siphon outlet.

The floor of the tank is laid to a level with the outlet from the tank the walls are built up and plastered both inside and outside with cement mortar and the supply pipe, vent pipe and iron steps are built into the wall each at its proper place. After hardening of the plaster the walls and floor

MILLER-ADAMS TRIPLE AUTOMATIC SYPHON FLUSH TANK

STARY AUTOMATIC SYPHON FLUSH TANK

of the tank will be coated with thick cement slush applied with a brush so as to make the tank absolutely water tight.

The siphon may be installed either during the construction of the flush tank or after the tank has been completed.

To install the siphon, a light bed of cement mortar is formed around the outlet from the tank and the trap of the siphon is placed upon this bed so that the outlet of the discharge leg shall enter the outlet from the tank. The discharge leg is made level by placing a spirit level on top of the trap and leveling it both ways. Cement mortar is then built up around the trap and care shall be taken that the trap is not disturbed until the cement has set sufficiently to hold it in place. After hardening of the cement the trap shall be filled with water, the cap placed over the discharge leg and the bell placed over the trap. Water may then be supplied and the tank put into operation.

PORTABLE GASOLINE DERRICK

A PORTABLE gasoline derrick called the Wonderhoister has been placed on the market by W. Van R. Whittall, Inc., 30 Church street, New York, N. Y. It consists of a direct connected gasoline engine and hoist with single or double drums mounted on a portable truck. The whole device is simple, compact, portable and economical, built of steel throughout, with either steel or wooden mast and booms.

The builder states that the machine is so constructed that it is adaptable for all hoisting purposes. It operates at a speed of from 75 to 150 feet per minute, and is arranged for use with a simple bucket or with a plain hook for ordinary hoisting; also with a drum and counterweight for operating with a clamshell bucket, and with a bull wheel on the mast for self-swinging. The "Wonderhoister" is also adapted to conveying, hauling, excavating and unloading purposes. It is used by contractors for handling concrete, sand and gravel in connection with sewer work and other construction. When not in operation with the derrick the engine is available for furnishing power for general purposes, such as running air compressors or small pieces of machinery.

STEEL SHEET PILING

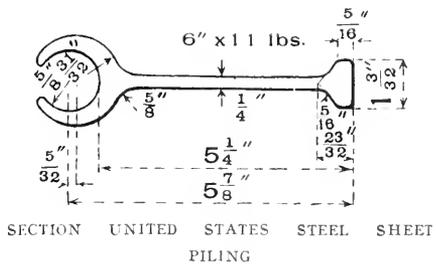

Immediately after the introduction of steel sheet piling, in November, 1901, when it was first used in the construction of the cofferdams for the Randolph Street Bridge, Chicago, its advantages in sewer and trench work, by reason of the possibilities of its indefinite reuse, were instantly recognized.

There are manufactured a number of sections which are suitable for sewer and trench work, in which case much lighter sections can be used than those required in cofferdam construction and deep foundations where the depth of penetration is great and the driving conditions difficult. In city sewer and trench work the driving is usually through loose ground to shallow depths, and heavy sections are not required. Sections are therefore, made light in weight, particularly adapted to his class of work.

The driving of steel sheet pil-

ing in sewer and trench work is exactly similar to that followed in driving wooden sheeting. Any form of light pile driver may be used, and the greatest economy is obtained when the piling is driven by a driver arranged to move on rollers along the line of the excavation as the work progresses. A 200-pound hammer operated by gas, steam or compressed air will drive light sections through ordinary soils up to 10 or 12 feet penetration. It has also been driven with a wooden dolly dropped from a tripod, by mauls, etc. It is desirable to use some form of driving cap to protect the heads of the piling from battering in order to permit reuse as often as possible without the necessity of straightening the material at the tops to prevent the binding of the sections in the interlock.

The most economical way to handle the work is to provide steel sheet piling for a convenient section of trench of such length that as the work pro-

SECTION UNITED STATES STEEL SHEET PILING

gresses the piling at the rear may be pulled and driven ahead, which means that the operations of driving, excavating, placing the sewer and backfilling are to go on continuously, the initial operation being carried on at the pile driver and the final operation at the rear of the excavation where the piling is pulled. Generally a hundred-foot length should be sufficient.

Steel sheet piling, being much stiffer than the ordinary 2-inch planking, there is less necessity for bracing, and it is possible to use safely only extensible trench braces and to omit the rangers, depending of course on the depth of the trench. In this way both the transverse and the longitudinal strength of the piling may be utilized, the sections taking a catenary curve between the

braces and, therefore, resisting the earth pressure both as beams and as arches.

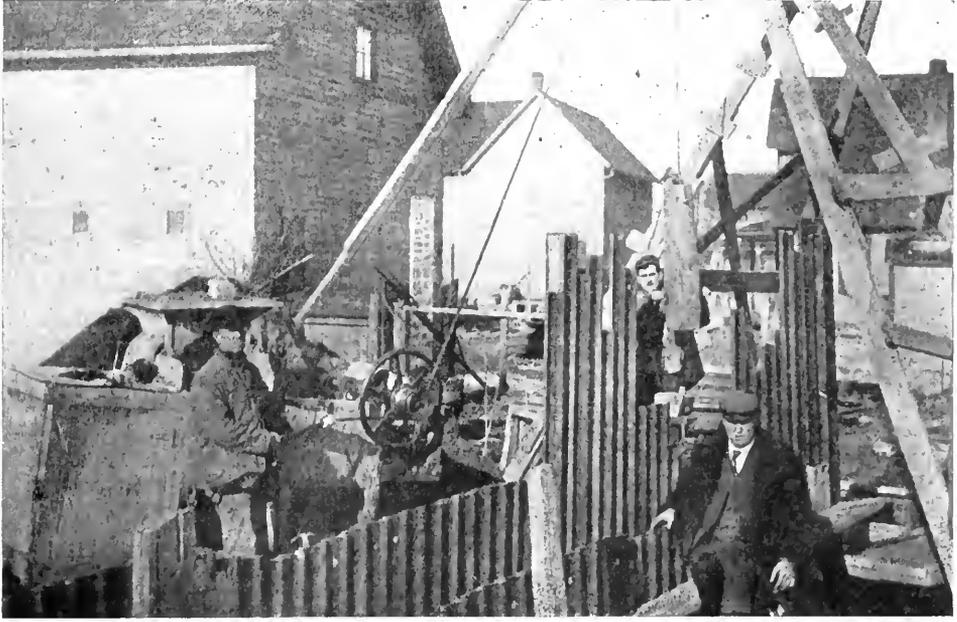

The number of times that steel sheet piling may be driven, pulled and re-driven is unknown. The largest number of times recorded in available records in any installation is 80, and the piling was reported to be just as good after the installation was completed as it was when it started.

In the construction of the Colonial avenue and Jamestown boulevard, at Norfolk, Va., in 1907, 6-inch 11-lb. United States steel sheet piling was driven 35 times with a 200-pound gas hammer in building 7,000 feet of trench. The piling was driven in quicksand and withdrawn with a tripod and horse, at a saving of about 40 per cent as compared with the cost of wooden sheeting.

In 1908 a trench 5 feet wide, 12 feet deep and 700 feet long, was excavated in sand, gravel and quicksand for the blast furnace of the Wickwire Steel Company, on the Niagara River, near Buffalo, N. Y. Enough 12-inch piling 16 feet long was bought for a trench 70 feet in length and was driven with a 2,800-pound drop hammer at a cost, including material, driving and pulling, of about \$3,300, as compared with an estimated outlay of \$4,200 for wood, and after the job was completed the steel sheet piling was inventoried by the contractor at \$1,400. The total saving was 48 per cent.

Some extremely low driving costs have been made in sewer work, as low as 3 1/2 cents per foot of penetration, and experience amply demonstrates the value of piling as a modern up-to-date tool of construction.

The illustration shows 6-inch 11-lb. United States steel sheet piling driven by a wooden dolly falling from a tripod in the construction of a sewer at the city of Flint, Mich., by a A. P. Southworth. Two thousand lineal feet of sewerage was built in 60-foot sections. The sections were driven about 35 times each at a cost for driving and pulling of 25 cents per lineal foot of trench for 10-foot lengths, and \$1 per lineal foot of trench for 20-foot lengths, through considerable quicksand and in water, the longer lengths being used through the quicksand.

DRIVING UNITED STATES STEEL SHEET PILING WITH WOODEN DOLLY

NEWS OF THE SOCIETIES

Third National Conference on City Planning.—Count Heinrich von Bernstorff, the German Ambassador to the United States, will be Philadelphia's guest and the principal speaker at the dinner to be given at the Bellevue-Stratford, May 17, to the members of the Third National Conference on City Planning. The dinner, which will be the closing feature of the three days' City Planning Conference, was originally arranged for 100 guests, but so great has been the interest in the conference that more than 600 men and women have already expressed a desire to attend. The invitations have been extended jointly in the name of the Mayor and the City Club.

The programme for the conference is being completed and the committee is now devoting its time to the exhibit which will be a popular feature of the conference. This will be the first municipal exhibit of city planning held in the United States under the auspices of a municipality.

The exhibition will be open to the public from May 15 to June 15, daily, between the hours of 10 a. m. and 10 p. m., and on Sundays between 1 and 5 p. m. The exhibits will be shown in the Mayor's reception room in the large conversation hall on the second floor of the City Hall, directly facing the north staircase, the Board of Education's main room and the north, east and west corridors on the second floor. The exhibition will be specially lighted by the Electrical Bureau.

More than 100 cities, including Paris, Berlin, Liverpool and other foreign municipalities, will be represented in the exhibition. In the London exhibit will be drawings of Piccadilly Circus. Through the efforts of the Commercial Museums a large collection of photographs will show harbor improvements in Havana, Rio de Janeiro and Buenos Ayres.

New York City will be represented by a large collection of plans prepared in 1907 by the New York Improvement Commission, showing dock and street improvements. These plans are all in perspective and are owned by the city of New York. Included in the plans will be a number of bridge improvements and the design, in perspective, for the Hudson-Fulton Memorial Water Gate.

Chicago will show plans which were prepared for the Commercial Club by D. H. Burnham and D. H. Bennett. About \$60,000 was spent in the production of these plans and about \$20,000 additional was expended on the preparation of the report, which has just been issued. This exhibit will be made by the Commercial Club of Chicago, and it will occupy the entire space in the Board of Education's main room. The plans in themselves show a linking up of all the territory within a radius of 75 miles of Chicago.

Philadelphia's exhibit will be the recently designed comprehensive plans, which will be shown in the Mayor's office.

Boston, which has officially appropriated \$1,500 to make an exhibit, will show many drawings illustrating projected improvements, together with designs for the Boston Exposition of 1915. Included in the Boston exhibit will be drawings showing the new park system, generally admitted to be the most magnificent park area in the United States. Cleveland will be represented

by a large number of original drawings showing improvements. The Chamber of Commerce is supervising the improvement work in Cleveland.

Baltimore will have a large exhibit showing the municipal activity started in that city, together with many drawings showing future development.

The Pittsburgh exhibit will be largely made up of the report, just published, showing projected improvements for the remodeling of the city streets so as to meet the traffic demands of the rapidly increasing population. The report was designed by Frederic Law Olmstead, chairman of the executive committee of the City Planning Conference, and one of his recommendations to the city of Pittsburgh is the creating of a magnificent park at the point where the two rivers join the Ohio and where Fort Duquesne was located. From that point the city of Pittsburgh had its beginning.

Other American cities which have arranged exhibits include Buffalo, Milwaukee, Washington, Minneapolis, Jersey City, Seattle, Rochester, St. Paul, Denver, Portland, Ore.; Columbus, Ohio; Toledo, New Haven, Scranton, Hartford, Des Moines, Kansas City, Wilkes-Barre, Savannah, San Diego and Los Angeles.

A general invitation will be extended to the public, and special days will be set apart for schools, organizations, societies, etc., to view the exhibits. It is probable that the offer of a number of university students to act as volunteer lecturers and guides will be accepted.

International Association of Municipal Electricians.—Secretary Clarence R. George, Houston, Tex., has announced that the annual convention will be held in St. Paul, Minn., September 12-15.

American Society of Mechanical Engineers.—Several important papers on patents will be presented at the New York meeting of the American Society of Mechanical Engineers, 29 West Thirty-ninth Street, at 8:15 p. m. on Tuesday, May 9, 1911. The subject will be discussed by E. W. Marshall, D. Howard Haywood, Edwin J. Prindle, all of New York. The purpose of this meeting is to outline to the engineer and manufacturer the fundamental principles of the patent law, the position and qualifications of a patent expert and the industrial development for the purpose of establishing a patent monopoly. The question of patent law is more a question of pure and applied science than it is of law and for this reason this subject interests engineers and all those trained in the mechanic arts. There are few legal practitioners who even pretend to have sufficient knowledge of patent law to practise in this field successfully and the experts who are to discuss the papers are by experience professionally conversant with the particular branch of the subject of which they treat.

Good Roads Association of Western Kentucky.—Over 200 citizens of six counties in Kentucky met at Middlesboro April 19 to attend a good roads convention. The convention was called to order by County Judge B. A. Fuson. Mayor Helburn, Middlesboro, delivered the address of welcome. Among the speakers were John W. Chalkley, Big Stone Gap, Va.; J. F. Bosworth, Middlesboro; T. J. Stewart, Winchester, and Ruby Lafoon, Madisonville. One of the objects of the meeting was to promote the construction of a road from Virginia to the Blue Grass region.

Playground Association of America.—The fifth annual meeting will be held

at the New Willard Hotel, Washington, D. C., May 10-13. The following is the program:

Wednesday, May 10, 8:00 p. m.—Rural Recreation, Professor L. H. Bailey, Cornell University, Ithaca, N. Y., Chairman Committee on Rural Recreation; Hon. William Kent, Kentfield, Cal.

Thursday, May 11, 9:30 a. m.—Games for Children under Ten Years of Age, Alice Corbin, Pittsburgh Playground Association. Demonstration, George E. Johnson, Superintendent Pittsburgh Playground Association. 10:45 a. m.—Games for Girls Ten to Fourteen Years of Age—Discussion by playground experts. Demonstration, George E. Johnson, Superintendent Pittsburgh Playground Association. 12:00 m.—Playground Equipment, E. B. DeGroot, General Director South Park Commissioners, Chicago, Ill.

Thursday, May 11, 2:30 p. m., Rosedale Playground, 17th and Kramer Sts., N. E.—Games for Boys Ten to Fourteen Years of Age, George E. Johnson, Superintendent Pittsburgh Playground Association. Delegates will themselves play volley ball, playground ball, soccer football. The teams will be captained by George E. Johnson and E. B. DeGroot. The leading playground workers have agreed to play on these teams. There will also be a volley ball game for young women delegates. 8:00 p. m.—Play as an Antidote to Civilization, Joseph Lee, President Playground Association of America, Boston, Mass.

Friday, May 12, 9:30 a. m.—What About Athletics on the Playground? Lee F. Hammer, Chairman Committee on Institutes, Playground Association of America, New York City. 10 a. m.—Play Leaders and Boy Scout Activities, James E. West, Secretary Boy Scouts of America, New York City. 10:30 a. m.—Sources from Which Recreation Workers May Be Secured, Clark W. Hetherington, Chairman Committee on Normal Course in Play, Chicago, Ill. 11 a. m.—The Guild of Play, Madeline L. Stevens, Play Supervisor Parks and Playgrounds Association of New York City. 11:30 a. m.—Question Box—Questions answered by leading playground experts. 2:30 p. m.—Possibilities of Dramatic Work—Demonstration, Edna V. Fisher, Pittsburgh Playground Association. 3:30 p. m.—Folk Dancing, Mrs. James J. Storrow, Chairman Committee on Folk Dancing, Boston, Mass. 4:30 p. m.—Folk dancing by delegates. 8 p. m.—Boys and Girls at Night—Speaker to be announced. Evening Recreation—Social Dancing, Mrs. Charles Henry Israels, Committee on Amusements and Vacation Resources of Working Girls, New York City. Active Games—Discussion by playground experts.

Saturday, May 13, 9:30 a. m.—Practice of Boy Scout activities by delegates. Boy Scout Patrols on the Playground, Preston G. Orwig, Field Secretary, Boy Scouts of America. 1 p. m.—An invitation to delegates has been extended by Mr. Arthur C. Moses, President of the Washington Playground Association, to be his guests at a luncheon at the Neighborhood House Social Settlement, 472 N Street, S. W., at 1 p. m. Following this there will be an opportunity to inspect the Settlement playground and witness a part of the Settlement's Annual Spring Festival. Small parties will be arranged to go from the Settlement to visit the other playgrounds.

American Society for Testing Materials.—The fourteenth annual meeting of the American Society for Testing Materials will be held at the Hotel Traymore, Atlantic City, N. J., Tuesday to Saturday, inclusive, June 27 to July 1. This year it is expected that most of the papers and committee reports will be printed and circulated in advance of the meeting. The present membership of the society is 1,342.

Syracuse Commission Government Association.—As the result of agitation which has been carried on for some time a number of citizens have formed the Syracuse Commission Government Association for the purpose of disseminating information regarding this system of municipal administration. Officers have been elected as follows: President, Giles H. Stilwell; vice-president, Thomas W. Meacham; treasurer, W. C. Brayton; secretary, Virgil H. Clymer. The following were placed on the executive committee: Louis Will, Hurlbut W. Smith, Charles W. Snow, Carlton A. Chase, J. Brewster Gere, Salem Hyde and Robert Dey.

Health Officers of Central New York.—A sanitary institute for the benefit of health officers of central New York was held at Syracuse, May 2 and 3. The following program was carried out:

First session, May 2, 2-5 p. m., held in the Municipal Laboratory, City Hall, Syracuse.

2-3—Laboratory demonstrations by laboratory staff. How to collect samples of water. The taking of specimens from throat for examination for diphtheria infection. The taking of blood for examination of typhoid infection. Collection of stools—specimen. Laboratory methods of examination.

3-4—Brief talks, Dr. W. W. White, "The Work of Municipal and County Bacteriological Laboratories"; Dr. F. E. Englehardt, "Local Laboratory Control of Water Supplies"; Dr. W. A. Bing, "Bacterial Diagnosis by the State Laboratory"; L. M. Wachter, "State Investigation of Water Supplies"; Dr. W. S. Magill, "The Use of the State Laboratories to the Physician."

4-4:30—Intermission, affording opportunity for discussion, the answering of questions, and further demonstrations.

4:30-5—H. B. Cleveland, "The Principles of Sanitary Investigations."

Second session, May 2, 8 p. m., held in the Municipal Laboratory.

Informal talks, Health Officer D. M. Totman and the State Commissioner of Health.

Question box, conducted by Dr. Hills Cole.

Third session, May 3, 9-12 a. m.

Field work on Skaneateles lake—A boat will convey the party to various points on the shores of the lake where the State sanitary engineers will discuss the methods employed for the protection of water supplies.

Lunch at Skaneateles.

Fourth session, May 3, 2-5 p. m.

Field work in sanitary investigation—(a), inspection of Skaneateles sewage disposal plant with a brief exposition of the construction and operation of disposal plants. (b), investigation of sanitary conditions of farms, villages, etc. Automobiles and other means of transportation were provided and the party (under the guidance of the State sanitary engineers) investigated the sanitary condition of as many farms, villages, etc., as time permitted.

The Health Bureau of the city of Syracuse demonstrated to visiting health officers the following features of its work:

Medical school inspection.

Isolation Hospital for contagious diseases.

Distributing reservoir and pumping plant.

Intercepting sewer (under construction).

Detention hospital for the insane.

Albany Society of Engineers.—At the meeting, April 25, Theodore Horton, consulting engineer, New York State Department of Health, gave an illustrated lecture on water filtration.

Engineers' Society of Western Pennsylvania.—At the monthly meeting of the society held in its headquarters in the Oliver Building, Pittsburgh, April 18, Dr. Joseph W. Richards, of Leigh University, South Bethlehem, Pa., presented a paper on "The Electrometallurgical Revolution in the Iron and Steel Industry of Norway and Sweden."

Southern Gas Association.—The annual meeting was held in Montgomery, Ala., April 19-21. The program of addresses was as follows: Commercial

Lighting, by J. N. Cooke, Jacksonville, Fla.; The Inspection of Gas Consumers and Gas Appliances, by F. G. Dean, of W. N. Crane & Co.; The All-Gas Kitchen, by G. W. Howsmun, Mobile, Ala.; Advertising, by Albert B. Kelley, U. G. I. Co.; Water Heaters—Automatic, Instantaneous, Circulating, W. J. McCartney, of Humphrey Company; Application of Gas-Fired Boilers, by G. W. McKee, of the Eclipse Fuel Engineering Company; Gas Illumination, by Norman MacBeth, Welsbach Company; Relation of the New Business Department to the Gas Consumer, by George Williams, of H. L. Doherty & Co.; Street Mains and Service Construction Policy, by K. L. Simons, Birmingham, Ala.; Starting a Gas Company, by J. C. Storm, Amarillo, Tex.; High Pressure Gas Plant with Medium Pressure on Mains, by F. H. Sawyer, Newbern, N. C.; Shop Management, by A. W. Young, Knoxville, Tenn. A gas show, held under the auspices of the Montgomery Light and Water Power Company, was one of the attractions of the session.

National Electric Light Association.

—A tentative program has been announced for the annual convention at New York, May 30-June 2. There will be 16 sessions in all, with 24 papers and some 40 reports. The general calendar of meetings is as follows:

May 30, A. M., first general session; evening, Public Policy Committee, report on welfare work plan.

May 31, A. M., first technical, commercial and accounting sessions; afternoon, second general and accounting sessions. June 1, A. M., first power transmission, second commercial and third accounting sessions; afternoon, second technical and third commercial sessions. June 2, A. M., second power transmission, third technical and fourth commercial sessions; afternoon, third general session.

Among the papers and reports the following are to be noted:

General Sessions—Reports on progress, accounting, overhead construction, insurance, question box, library, rate research, section organizations and changes in constitution; "Master and Men," by Mr. Paul Lupke; "Electrical Exhibitions," by Mr. L. A. Ferguson; "Valuation of Properties as Related to Rates," by Mr. W. F. Wells; "Reasons for Variations in Rates Under Varying Conditions of Operation," by N. T. Wilcox; "The Standardization of Electrical Selling," by Douglass Burnett; "Economics in Operation Possible Through Time Study," by Mr. L. B. Webster.

Technical Sessions.—Reports on pole preservation, underground construction, overhead construction, meters, prime movers, lamps, electrical apparatus, grounding of secondaries; "The Ventilation of Turbo-Generators," by Mr. R. B. Williamson; "Progress and Development in Self-Cooled Transformers," by Mr. H. O. Troy; "Grounding Low Tension Circuits," by Mr. P. M. Lincoln; "Recent Improvements in Single Phase Motors," by W. A. Layman; "Relation of Motor Load to Central Station Equipment," by F. D. Newbury.

Power Transmission Sessions.—Reports on governmental control of water powers and lightning protection; "Utilization of Central Stations for Supply of Electricity to Operate Railroads," by Mr. Fred Darlington; "A New Method of Reducing the Investment in Central Station Boiler Plants," by Mr. H. A. Wagner; "Determining Cost of Production in Steam Properties Under Varying Conditions," by G. H. Walbridge.

Commercial Sessions.—Reports on electricity in rural districts, power, electric vehicles, residence, business, improved standards of industrial lighting, advertising, competitive illuminants, sales departments.

Accounting Sessions.—"Tracing Store-room Material," by J. T. Brady; "The Purchasing Department," by Mr. T. W. Buxton; "Advantage of Job Cost System," by Mr. Alex. Holme; "Handling Customer's Orders," by Mr. R. F. Bon-sall; "Collection of Bills," by Mr. E. J. Bowers; "Electric Vehicle Accounts," by Mr. Herman Spoehrer; "General Office Accounting," by Mr. Franklin Heydecke; "Depreciation," by Mr. H. M. Edwards; "Use of a Tabulating Machine in Accounting Work," by Mr. Wm. Schmidt, Jr.

International Congress on Hygiene and Demography.

—The fifteenth congress will be held at Washington, D. C., September 23-28, 1912. The object of the congress is to extend the knowledge and improve the practice of hygiene, public health and vital statistics in the countries which participate. Invitations to participate have been accepted by 21 countries. Occupational diseases and industrial accidents will be taken up by the section of industrial and occupational hygiene; the hygiene of houses and streets, water supply, disposal of waste and the legislative and administrative functions of boards of health will be discussed before the section of state and municipal hygiene; the section of hygiene of traffic and transportation will take up street traffic, street railway (including subways and elevated lines), railways, river and lake traffic and sea traffic, giving attention both to sanitation and to the prevention of accidents. The six other sections will deal respectively with microbiology and parasitology; dietetics and physiology; hygiene of infancy and childhood; control of infectious diseases and tropical, military and naval hygiene.

The preliminary announcement states that any person interested may become a member of the congress, entitled to participate in the proceedings and to receive a copy of its transactions upon payment of the membership fee of \$5. The address of the congress is Army Medical Museum, Washington, D. C.

Missouri Electric, Gas, Street Railway and Water Works Association.

—The fifth annual convention was held at Jefferson Hotel, St. Louis, Mo., April 13-15. Mayor Kreismann delivered the address of welcome. In connection with the reading of the minutes a discussion arose as to the advisability of admitting municipal plants to membership and a resolution was carried to the effect that they should be admitted. Among the papers read were the following: "Centrifugal Pumps," by W. H. Reeves; "Lubrication," by A. E. Flowers, University of Missouri; "Liability Insurance for Public Service Corporations," by Judge D. D. Taylor, St. Louis; "Illuminating Engineering," by J. H. McGlensey, St. Louis; "The Electric Vehicle," by Herman Spoehrer, St. Louis; "Ornamental Street Lighting," by N. J. Cunningham; "District Steam Heating," by H. C. Kimbrough; "Coal and water Gas," by P. A. Bertrand.

The following officers were elected: F. E. Murray, Louisiana, president; P. A. Bertrand, Jefferson City, first vice-president; J. G. Harsh, Joplin, second vice-president; C. L. Clary, Sikes-ton, third vice-president, and N. J. Cunningham, Springfield, secretary-treasurer.

Calendar of Meetings

- May 15-17.
National Conference on City Planning.—Philadelphia, Pa.—Flavel Shurtliff, Secretary, 19 Congress street, Boston, Mass.
- May 17.
Massachusetts Highway Association.—Quarterly Meeting in conjunction with the New England Conference on Street Cleaning, Springfield, Mass.
- May 17.
New England Conference on Street Cleaning.—Springfield, Mass.—Corresponding Officer, Carol Aronovici, 55 Eddy street, Providence, R. I.
- May 18-19.
Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25.
National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26.
National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 25-26.
League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2.
National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14.
National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-10.
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. DiVen, Secretary, 14 George street, Charleston, S. C.
- June 7-14.
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 11-16.
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- August 15-18.
Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 12-15.
International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 19-22.
International Association of Fire Engineers.—Annual Convention, Racine, Wis.
- September 19-22.
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Polwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6.
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

PERSONALS

BALDWIN, BERT, expert engineer, of Cincinnati, O., will be sent to Louisville to inspect the roller bearings and steel work for the reconstruction of Mohawk bridge.

BENNETT, WM. W., has been elected Mayor of Rockford, Ill.

BINGHAM, GEN. THEODORE A., U. S. A., retired, has been appointed Chief Engineer, in charge, in the Bureau of Highways, New York City, succeeding George W. Tillson.

BROGDEN, W. J., was elected Mayor of Durham, N. C., without opposition, at a recent election.

BURNS, CLINTON S., Consulting Engineer, of Kansas City, Mo., has completed an investigation of the water works system of South Bend, Ind.

BUSSE, CARL, was elected Mayor of Laurenceville, Ill., on the Citizens' Improvement ticket.

CARPENTER, GEORGE, City Engineer of Providence, R. I., recently delivered an interesting and instructive address on the Panama Canal.

CASSON, HERBERT N., efficiency engineer, who has lectured on and investigated municipal problems all over the country, spoke before the Chamber of Commerce of Rochester last week at a corporation meeting. The title of his address was "Industrial Efficiency as Applied to the Development of a Great City."

CHADWICK, JOHN B., has been appointed road superintendent of Great Barrington, Mass.

CHISHOLM, R. B., was elected Mayor of Halifax, N. S., for a third term by acclamation.

CHRIST, S. V., has been re-elected Mayor of Miller, S. D.

CLARK, C. N., is the new Mayor of South St. Paul, Minn.

DALTON, RUFUS I., has been elected Mayor of Winston-Salem, N. C., on the Democratic ticket.

FAWCETT, C. V., Mayor of Tacoma, Wash., has been recalled by a recent election instituted by the Welfare League, and W. W. Seymour is the new Mayor-elect, having polled 11,246 votes against 10,394 for Mr. Fawcett. Mr. Seymour will take office at the end of ten days. Mr. Seymour and Mr. Fawcett were the two leading candidates at an election only two weeks ago, when a Socialist also was in the race. Mayor-elect Seymour was the candidate of the Welfare League, and was defeated.

FRANKLIN, H. M., who has served as Mayor several times, was elected Mayor of the city of Tennillo, S. C., without opposition.

GLEASON, WALTER L., has been selected attorney for the Sewerage and Water Board of New Orleans, succeeding Omer Villere.

GOOLAND, W. S., is the new Mayor of Racine, Wis.

HANCOCK, H. D., has been appointed Fire Commissioner of Binghamton, N. Y., succeeding Wm. Barnett, resigned.

HAY, S. J., Mayor of Dallas, Tex., expects to travel in Europe this summer.

HICKEY, JOHN M., representing the American Association for Highway Improvement, delivered an address in Birmingham, N. Y. The organization which he represents has in view the affiliation of all good roads associations, and Captain Hickey has arranged to tour many of the Southern cities which have figured prominently in recent days in the movement for building public highways. Among the other cities Captain Hickey will visit are Roanoke, Va.; Bristol,

Tenn.; Knoxville, Chattanooga, Atlanta, Montgomery, Mobile, New Orleans, Vicksburg, Memphis, Little Rock, Nashville, Louisville, Frankfort and Lexington.

LAWTON, CHARLES F., has been re-elected superintendent of public works of New Bedford, Mass.

LEWMAN, WILL C., has been elected Mayor of Danville, Ill.

MCCLELLAN, WM., of New York, has been appointed Consulting Electrical Engineer of the Public Service Commission, Second District, to succeed Howard H. Crowell, of Syracuse, who resigned from the service of the commission on April 15. Mr. McClellan is a graduate of the University of Pennsylvania, and was also instructor there. He has been engaged in work with the Philadelphia Rapid Transit Company, the electrification of the New York terminal of the Pennsylvania Railroad, the electrification of the Rochester branch of the Erie Railroad, and as consulting engineer on other important work. He is a member of the Railway Committee of the American Institute of Electrical Engineers, the Electrification Committee of the New York Railroad Club, the American Institute of Electrical Engineers, and of the American Society of Mechanical Engineers.

MCGRAW, P. H., has been appointed Street Commissioner of Duluth, Minn.

MCINTIRE, WM. W., who was appointed a member of the Sewerage Commission by Mayor Mahool, was immediately confirmed by the Second Branch of the City Council. He succeeds the late Gen. Peter Leary, Jr., as a member of the commission, Charles England having recently been elected to succeed General Leary as chairman.

MILLER, BEN F., has been elected City Civil Engineer of Meadville, Pa.

MUESER, WM., one of the best-known bridge builders and civil engineers of the United States, has been invited by the Board of Contract and Supply of Albany, N. Y., to inspect the drawings of the proposed river front improvements.

MURPHY, J. J., has been appointed Chief of Police of Butte, Mont.

O'NEIL, JOSEPH, has been reappointed City Engineer of Leavenworth, Kan.

SCHORER, ARNO R., has been appointed Director of the Parks and Playgrounds Association of New York City. Mr. Schorer was for four years connected with the Bureau of Advice and Information of the Charity Organization Society.

SITTERLE, S. S., has been re-elected Mayor pro tem. of Victoria, Tex.

THATCHER, CHARLES W., the "Apostle of Good Roads," delivered an address last week at Vincennes, Ind., under the auspices of the Board of Trade.

TODD, J. H. L., who has been Mayor of Fanwood, N. J., since 1909, has resigned because of the pressure of personal business.

WEIR, L. H., the public playground worker, who is touring the Northwest in the interest of playground improvements, recently delivered several addresses at Tacoma, Wash.

WEST, JOHN T., is the new Mayor of Pueblo, Col.

WHITE, JOHN T., has been reappointed Fire Commissioner of Saratoga Springs, N. Y.

WILGUS, WM. J., has been awarded the Telford gold medal for the paper read by him before the recent session of the Institution of Civil Engineers of Great Britain. Mr. Wilgus was formerly vice-president and chief engineer in charge of maintenance of way and construction of the New York Central, on which he installed the electric system between this city and suburban points.

TRADE NOTES

Cast Iron Pipe.—Chicago: Actual business recently closed has been comparatively small, but specifications are liberal and inquiries frequent. Prices are firm. Quotations: 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham: Consumers of cast-iron pipe have been inclined to delay in placing orders. Prices are well maintained. Quotations: 4 to 6-inch, \$23; 8 to 12-inch, \$22; over 12-inch, average, \$21. New York: The market is very quiet. Quotations: 4-inch, car loads, \$21 to \$22.

Lead.—Lead is quiet and barely steady. Quotations: New York, 4.425c.; St. Louis, 4.275c.

Pumping Machinery.—The International Steam Pump Company, through its foreign branch, has obtained a contract to build municipal water works at Buenos Ayres, the estimated cost of which will be \$1,090,000. The company has not decided as yet at which of its plants the pumping equipment will be made, but it is understood that the fulfilling of the contract will entail expenditures in the general market.

Contractors' Machinery.—Hetherington & Berner, Indianapolis, Ind., engineers, have under construction a new plant which will cover about four acres. The plant will be of fireproof construction. The company will enlarge its line of manufacture, and in addition to its specialty of asphalt paving plants and machinery will manufacture other kinds of contractors' machinery, including concrete mixers, road rollers, steam shovels, etc. The company will also extend its operations in steel construction work.

Cement Plant.—The Dakota Portland Cement Company, Sioux Falls, S. D., states that the construction of its plant at Chamberlain, S. D., is well under way, and that it is expected to be ready for operation about Nov. 1. It will have a daily capacity of 2,500 to 3,000 barrels. The buildings are of steel and concrete construction, and together with the terminals cover an area equal to 12 acres. The company owns its own terminals, and will operate its own locomotives.

Road Work Condemned.—The protest of the Board of Supervisors of Ontario County, N. Y., against the acceptance of the Manchester-Clifton springs highway 607, built by the Ganz-Wilson Construction Company in 1908, under State Engineer Skeene, has been sustained by the State Highway Commission. The decision stated that the road was not in condition for acceptance. The stone used in the top course was not that called for in the contract. That the change in stone was permitted by the State Engineer's Department without the approval of the Board of Supervisors of Ontario County. The contractors were notified to complete the work in accordance with the terms of the contract.

Road Oil.—The Standard Oil Company is now delivering in different parts of the Borough of Queens, New York, 40,000 gallons of oil. It will be used on the roads in the thickly settled sections and on main traffic thoroughfares.

Auto Fire Apparatus.—The Garford Company, Elyria, O., have announced that they will manufacture motor-driven fire apparatus, patrol wagons, ambulances and other automobiles used in the public service of municipalities. R. K. Johnson, of the Garford Company, has designed a chief's car, carrying a 35-gallon chemical tank.

Street Oiling.—Street Commissioner Thompson, Elizabeth, N. J., will have the streets oiled this year at a unit contract price per square yard. Sands & Company have taken a contract to apply Texas oil for \$0.009 per square yard for the first application, and \$0.0085 for subsequent applications. The grade of oil used contains 25 per cent of asphalt.

Gasoline Fire Engine Tested.—In the presence of Battalion Chief John Howe and Captains Demarest and Henry, of the New York Fire Department, at Springfield, Mass., a test of the Knox 700-gallon capacity gasoline fire engine was made. When the gasoline engine was started one line of hose burst and the motor had to be shut down to make repairs. It was started again and ran an hour without a skip. The two lines of 2½-inch hose connected to the pump were each 150 feet long. One line was equipped with a 1½-inch nozzle and the other had a 1¼-inch nozzle. In the capacity test the pressure at the 1½-inch nozzle was 73 pounds and at the 1¼-inch nozzle, 66 pounds. With the 66-pound pressure, 378 gallons per minute were discharged and with the 73-pound pressure 330 gallons were thrown, making a total of 708 gallons every minute. The overflow from the radiator, which was 12 gallons per minute, added to the 708 gallons, made a total throw of 720 gallons per minute. The average altitude was 130 feet and the pump action was 310 revolutions per minute. The pressure test showed 235 pounds at the pump and 125 pounds at the 1½-inch nozzle, throwing 425 gallons, to which was added the radiator overflow amounting to 12 gallons, making a total of 437 gallons for the pump discharge. During the hour and over that the engine was run every part of the motor gave perfect service and owing to the new system of oil cooling there was no trouble with overheating. At the test of the first gasoline pump made by the company it was noticed that the vibration was considerable and to overcome this a set of special jacks was designed for the frame. These reduced the vibration to a minimum. The first pump built had a capacity of 600 gallons a minute, but the New York department wanted more, so this pump was designed to furnish 700 gallons capacity.

High Pressure Gas System.—The Galveston Gas Company has installed a high pressure system to serve the eastern section of the city. A 4-inch wrought-iron pipe carries the gas under pressure from a booster at the works. Eight district governors or pressure-reducing devices have been installed and eight more will be put in. One governor is used to distribute the gas over an area of two or three blocks. The governors are installed in concrete stepping stones, an idea which originated with General Manager F. M. Lege, Jr., who conceived the idea of presenting residents with stepping stones costing \$35 each, and at the same time serving the valuable purpose of housing the governors.

Consulting Engineer.—James L. Tighe, Holyoke, Mass., announces that after serving the city of Holyoke for the past nineteen years as engineer of the municipal water works and city engineer, he has opened offices in the Caledonian Building, Holyoke, Mass., and hereafter will be open to engagement as consulting engineer in all problems relating to hydraulic and municipal engineering.

Consulting Engineer.—Hiram Allen Miller, Consulting Engineer, announces that, having completed the Charles River dam and basin, he has removed his office to 8 Beacon street, Boston, Mass.

Pavement Litigation.—Through the awarding of a contract for street paving to the Barber Asphalt Paving Company, Holland, Mich., will become involved in paving litigation. Contractor Harry Vanderveen, of Grand Rapids, who represents the Barber Company, submitted figures on the job for paving the thoroughfare with a mixture, upon which material the Warren Bros. claim to hold a patent and on which they claim the right to collect a royalty of 25 cents per yard. Warren Bros. warned the City Council in a telegram not to award the contract to any firm not having a license to use their mixture, as they would certainly bring suit, but the Barber Company immediately put up a certified check for \$3,000, so that in case of suit being brought it will be between the companies and the city can go ahead and complete the work. The Barber Company claims there is no difference between the mechanical mix to be used by them and that under the patent and are anxious to test the case in the courts.

Cement Rates.—The Interstate Commerce Commission has decided that general increases in freight rates on cement in trans-Missouri territory were not justified and the commission ordered the carriers to withdraw practically all of the tariffs making the increases. The carriers are directed to withdraw the tariffs by May 15 and if they do not do so the commission says that it will issue an additional order directing the maintenance of the present rates for a period of two years. If the additional order is issued the railroads will not be able to make any increases in this community until the two years have expired. The commission approved a few of the increases.

Foundations.—The Foundation Company, 115 Broadway, New York, announces that Daniel E. Moran has retired from active participation in the management of the company to engage in the practice of engineering. He will hereafter act as consulting engineer of this company, with offices at 55 Liberty street, New York City.

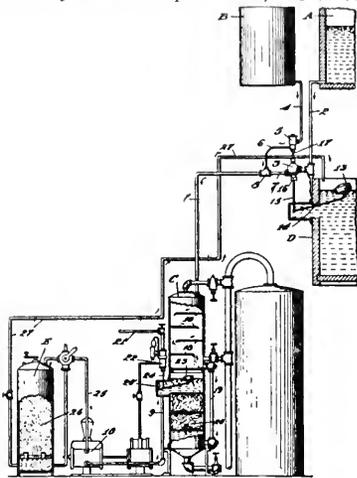

Concrete Mixers.—The Eureka Machine Company, Lansing, Mich., has published a budget of letters commending its mixer. Several years ago the Davenport Construction Company, Milwaukee, Wis., preliminary to the purchase of a mixer, wrote to a number of parties whose names were mentioned in a Eureka circular as customers, asking them about the machine. The letters published are the replies.

Crane Signal System.—Terry & Tench are testing a new crane signal system on their work at the Grand Central Station improvements. It is claimed to reduce the chances of accident to a minimum. By means of a small bulb the signal man at the boom can operate electric lights which show white for "Go slow," green for "Full speed," and red for "Stop." The lights are accompanied by whistles which designate, by the length and tone of the blast, what they are intended to indicate. In case of a short circuit putting the lights out the signal man can press a button at the end of the bulb, which rings an electric bell warning the engineer that he must rely on the whistles for working the boom instead of the lights.

PATENT CLAIMS

989,141. PASTEURIZING APPARATUS. Frederick Gettelman, Milwaukee, Wis. Serial No. 495,177.

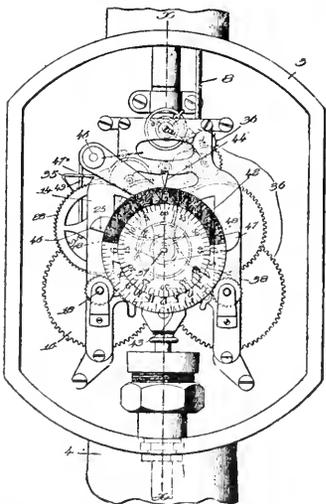

A pasteurizing apparatus comprising a housing having a series of four vats arranged therein one above the other adapted to contain water at progressively higher temperatures from the first vat to the second vat of the series, the third and fourth vats being adapted to contain water at progressively lower temperatures, the water in

the first and last vats of the series being approximately at even temperatures, guide sheaves disposed at the ends of each vat, a well at the forward end of the housing communicating with the lower vat, an endless conveyer arranged to pass over sheaves of the first vat under the rear sheave of the second vat and over the forward sheave thereof, under the forward and over the rear sheave of the third vat and under the sheaves of the fourth vat and from thence completing its circuit to the forward sheave of the first vat through the housing well.

989,654. AUTOMATIC GAS LIGHTER AND EXTINGUISHER. Francis W. Sherman, Everett, Mass., assignor to Independent Street Lighting Company, Boston, Mass., a Corporation of Massachusetts. Serial No. 569,449.

In an automatic gas lighter and extinguisher, the combination with a valve, of a spring for operating said valve, a cam member operated by said spring and having a recess, a pivoted locking lever adapted to enter said recess, an arm provided with a nose connected to and moving with said

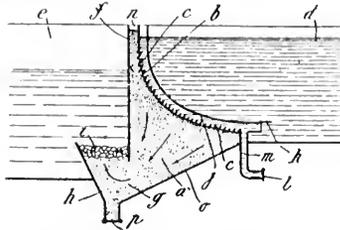

lever, a wheel provided with notches to receive said nose when the locking lever is occupying said recess, a toothed member rigid with said notched wheel, a one-toothed pinion rotated by said cam and adapted to engage said toothed member thereby to rotate the notched wheel intermittently when the cam is released, and time mechanism to release the locking lever from the recess of the cam at predetermined intervals.

989,322. DISINFECTING COMPOSITION. Oscar Bernheimer, Vienna, Austria-Hungary. Serial No. 457,281.

A microbicide composed of bisulfate of soda and sodium borofluorid.

989,665. SAND FILTER AND THE LIKE. Auguste Tixier, Billancourt, France. Serial No. 523,417.

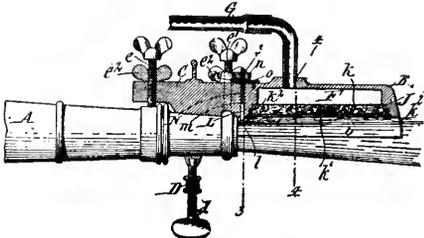

In a filter for liquids and gases, a body of granular filtering material, a wall formed by spaced blades to hold the filtering mate-

ria, a supply chamber of which said wall forms a part, means to produce a scouring current of liquid over said wall to remove the surface of the filtering material exposed between the blades.

989,880 AIR-SUPPLYING DEVICE FOR FIREMEN. George W Shaw, Buffalo, N. Y. Serial No. 338,609.

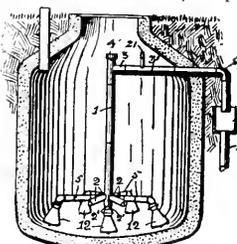

An air supplying device comprising a hood having a shank adapted to be attached to a water delivery nozzle and having an

air receiving chamber adapted to be arranged at the side of the stream issuing therefrom, a delivery conduit connected with said chamber, and a filter arranged in the path of the air.

989,827. AUTOMATIC CISTERN-CLEANING APPARATUS. Louis Thiem, Toledo, O. Serial No. 582,462.

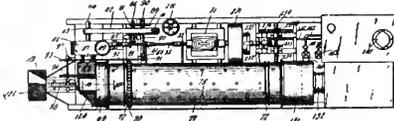

In an automatic cistern cleaner of the character described, the combination with the waste pipe of a cistern, of a main discharge pipe connected to the waste pipe and extending from the waste pipe to near the bottom of the cistern; a plurality of

extensible branch pipes radially connected to the lower portion of the main pipe, and a plurality of receivers, one for each branch pipe and the main pipe, said receivers having enlarged rim bases provided with a plurality of feet adapted to support the main pipe and its branches above the bottom of the cistern and form openings to admit water and sediment radially to the receivers.

990,782. APPARATUS FOR PREPARING PAVING MATERIAL. Herman J. Rufli, Indianapolis, Ind., assignor to The American Paving & Manufacturing Company of Indianapolis, Indianapolis, Ind., a Corporation of Indiana. Serial No. 479,580.

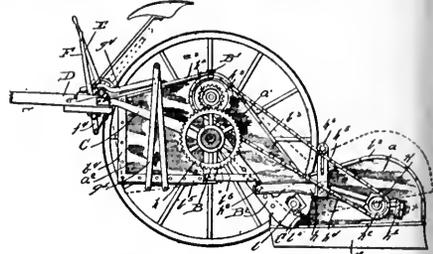

The combination, in an apparatus for preparing paving material, of a rotary drying cylinder, a stationary inclosing casing at each end of said cylinder, a furnace communicating with the inclosing casing at the delivery end of said rotary drying cyl-

inder, and a suction fan communicating with the chamber of the casing at the receiving end of said cylinder whereby the products of combustion from said furnace are drawn through said cylinder and discharged from the delivery nozzle of said fan, a receiving hopper delivering to said rotary drying cylinder, and an automatically opening and closing door arranged in the passage between the hopper and drying cylinder.

990,128. SWEEPING - MACHINE. Pierre Haerst, Chicago, Ill. Serial No. 350,055.

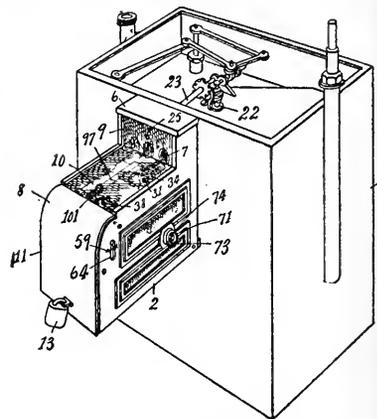

A sweeping machine, embracing a housing pivotally supported intermediate its length, a rotative brush inclosed thereby, an ele-

vator in the housing for the dirt swept up by the rotative brush, and yielding means for adjusting the housing on its pivot to vary the pressure of the rotative brush on the surface swept.

990,125. BILL-DELIVERY MECHANISM FOR METERS. Richard W. Gallagher, San Francisco, Cal., assignor to Automatic Billing Company, Los Angeles, Cal., a Corporation of California. Serial No. 244,634.

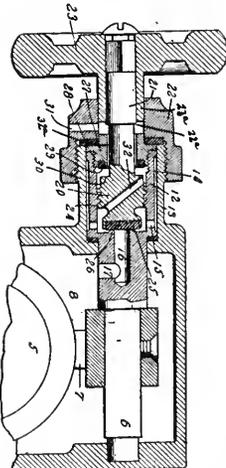

In an apparatus of the character described, the combination, with meter gear-

ing, of a recording wheel, a gear wheel for intermittently advancing said recording wheel, means for moving the recording wheel bodily to take a record therefrom, an operative connection between said gear wheel and gearing, inoperative when the wheel has been so moved and means adapted to be brought into operative connection with said gear wheel when the latter is out of operative connection with the gearing to turn said wheels to zero, substantially as described.

990,580. PIPE-TAPPING MACHINE. Philip Mueller and Anton C. Schuermann, Decatur, Ill., assignors to The H. Mueller Manufacturing Company, Decatur, Ill., a Corporation of Illinois. Serial No. 593,854.

In a tapping machine, a valve body, a main valve therein, said body having a by-pass formed therein and leading around

said valve, a by-pass valve of the compression type for controlling communication through said by-pass on opposite sides of the main valve, and an operating device common to both said valves.

relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

Table with 4 columns: STATE, CITY, RECEIVED UNTIL, NATURE OF WORK, ADDRESS INQUIRIES TO

STREET IMPROVEMENTS

Main table listing street improvement projects across various states including Missouri, Indiana, Ohio, Illinois, New Jersey, Florida, Minnesota, West Virginia, California, New York, Maryland, North Carolina, South Carolina, Louisiana, Arkansas, Kentucky, Pennsylvania, New Hampshire, Tennessee, Mississippi, and Wyoming.

SEWERAGE

Table listing sewerage projects across various states including Pennsylvania, Ohio, Indiana, Illinois, West Virginia, Kansas, Minnesota, Wisconsin, New Mexico, California, Michigan, Missouri, Nebraska, and Oregon.

WATER SUPPLY

Table listing water supply projects across various states including Michigan, Mississippi, Missouri, Nebraska, Pennsylvania, Ohio, and Oregon.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
WATER SUPPLY (Continued)				
Ohio	Cincinnati	May 9, noon	Laying cast iron pipe, special castings and valves; and miscellaneous work for Water Dept.	John J. Wenner, Clk. Bd. Pub. Ser.
California	Anaheim	May 11	Furn. compound automobile steam engine; 150 kv., 2,200 volts, 3-phase, 60-cy. alter. current gener.; an exciter for gen.; gener. switchboard panel; building foundations.	Edw. B. Merritt, City Clk. F. Feuchter, Clerk. C. H. Foy, City Clerk. Chas. Strauss, Pres. Bd. W. Sup.
Ohio	Rockport	May 12	Constructing water mains.	D. P. McIntyre, City Clerk.
Iowa	Tipton	May 15, 7:30 p.m.	Drilling an artesian well.	C. H. Foy, City Clerk.
New York	New York	May 16, 11 a.m.	Construct. portions of the city tunnel of the Catskill aqueduct.	Chas. Strauss, Pres. Bd. W. Sup.
Minnesota	Eveleth	May 16	Furn. 12,500,000 gal. capacity, high duty pumping engine of the crank and flywheel type.	D. P. McIntyre, City Clerk.
California	Fort Mason	May 17, 11 a.m.	Constr. a 6,000,000-gal. reinforced concrete reservoir.	Col. Geo. McK. Williamson, C on Q.M
California	Los Angeles	May 26	Furn. fabricated steel and rivets necessary to con. abt. 1,865 ft. of 9-ft. 3-in. and 8,313 ft. of 11-ft. riveted steel syphon.	Board of Public Works. Wm. McQueen, City Clerk.
Brit. Col., Can.	Vancouver	May 31, 4 p.m.	Furn. steel pipe, i. pipe; also 18-in. flexible joint c. i. pipe.	Wm. McQueen, City Clerk.
BRIDGES				
Pennsylvania	Holidaysburg	May 5, noon	Repairing 5 bridges in Blair County.	W. S. Hostler, Clk. Co. Com Board of County Commissioners.
Pennsylvania	Sunbury	May 5	Constructing four bridges.	Board of County Commissioners.
Ontario, Can.	Woodstock	May 6	Constructing three steel bridges and concrete abutments for same; also constructing two or three concrete bridges.	F. J. Ure, County Engr.
Kentucky	Louisville	May 8	Constructing Underhill st. bridge reinforced concrete, cost about \$15,000.	City Clerk.
Indiana	Shelbyville	May 8, 10 a.m.	Constr. a bridge in Sugar Creek township and constructing concrete abutments and the repair of St. Paul bridge.	G. B. Huntington, County Auditor. County Commissioners.
Indiana	Washington	May 8	Constructing 7 culvert bridges.	County Commissioners.
Pennsylvania	Lancaster	May 9	Constructing a concrete dam across Conestoga river at pumping station of water works.	J. A. Leinbach, Clk. Water. Com.
Pennsylvania	Philadelphia	May 9	Widening Chestnut Street bridge over Schuylkill River; building bridge on Springfield Ave., value of work about \$40,000; constructing additional piling fender for the Passyunk Ave. bridge.	Geo. Hummel, Chm. Chosen Freeholders Essex County. John M. Tucker, Chm. S. R. Com.
New Jersey	Newark	May 9	Constructing concrete arch bridge and a plate girder bridge in Bloomfield.	Philadelphia & Reading R. R. Co. F. M. Sayre, County Auditor. City Clerk. Kingsley L. Martin, Comr. of Br. City Clerk.
Maryland	Baltimore	May 10, noon	Constructing one concrete bridge in Calvert County.	Geo. Hummel, Chm. Chosen Freeholders Essex County. John M. Tucker, Chm. S. R. Com.
Pennsylvania	Philadelphia	May 10	Constr. masonry wall and abutments; also bridges ready for ballast over Aramingo av., Belgrade and Thompson sts.	Philadelphia & Reading R. R. Co.
Ohio	Columbus	May 16, noon	Constr. the approaches and superstructure of the Wilson Bridge over Olentangy river.	F. M. Sayre, County Auditor. City Clerk. Kingsley L. Martin, Comr. of Br. City Clerk.
Pennsylvania	Pittsburg	June 1	Widening Smithfield Street Bridge, cost about \$150,000.	City Clerk.
New York	New York	June 1	Strengthening the end spans of the Williamsburg Bridge.	Kingsley L. Martin, Comr. of Br. City Clerk.
Pennsylvania	Pittsburgh	July 1	Constructing one concrete arch, estimated cost \$85,000.	City Clerk.
LIGHTING AND POWER				
Tennessee	Gallatin	May 5, noon	Furn. Corliss engine; 2 gen.; 2 switchb.; 2 elec. oper. pumps.	E. L. Anderson, Chm. W. & L. Com.
Missouri	Chillicothe	May 8, 9 a.m.	Constr. municipal electric light and power plant, including deep well for water supply, tower and tank, etc.	Ira G. Graham, City Auditor.
Illinois	Yorkville	May 10, noon	Constr. a dam across Fox river; a power house with wheel pits, etc., complete.	Fred W. Simpson, Secy.
Maryland	Baltimore	May 10, 11 a.m.	Furnishing ornamental lamp posts.	Robt. J. McCuen, Supt. of Lamps and Lighting.
California	Riverside	May 24	Franchise to run poles and line for conveying electric power on all roads of county.	County Supervisors.
FIRE EQUIPMENT				
New York	Rensselaer	May 8	Furn. 500 ft. 2½-in. fire hose.	Salt, City Clerk.
California	Oakland	May 17, 11 a.m.	Furn. 3 combination chemical hose wagons; 3 third size steam fire engines; 1 motor driven pumping engine; 3 motor-driven combination chemical and hose wagons, and fire hose.	Jas. W. Nelson, Sec'y Bd. Pub. Wks.
Oregon	Astoria	May 27, 8 p.m.	Furn. 1,200 ft. 2½" fire hose for Fire Dept.; 200 ft. for Street Dept.	C. E. Foster, Chief Fire Dept. E. M. Urdike, Chm. P. & W. Com.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Urdike, Chm. P. & W. Com.
MISCELLANEOUS				
Pennsylvania	Eric	May 8, 8 p.m.	Constructing an incinerator plant complete.	B. E. Briggs, City Engr.
West Virginia	Wheeling	May 8	Wrecking the easterly resort house and rebuilding.	City Engr.
Ohio	Cincinnati	May 10, noon	Constructing hospital buildings.	Hannafor & Sons, Arch.
Connecticut	Plymouth	May 10, noon	Alterations and additions to Town Hall at Terryville.	J. D. Waldron, Selectman.
Wisconsin	Superior	May 11, 1 p.m.	Improving of Quebec Pier by constructing a revetment along the sides of driveway.	P. J. Ekstrand, Pres. Bd. Public Wks. Isidore Wachsmann, Sec'y Bd. Cont. and Supply.
New York	Albany	May 15, 3 p.m.	Installing police signal system.	M. B. Matthews, Chm. Com. Pub. S. Clinton Sipe, County Auditor.
New Jersey	Passaic	May 19, 8 p.m.	Install Police Signal, Fire Alarm and Mun. Tele. Exchange.	M. B. Matthews, Chm. Com. Pub. S. Clinton Sipe, County Auditor.
Ohio	Mount Gilead	May 19, 11 a.m.	Furn. iron culvert pipe from 8 to 48-in. diameter.	Clinton Sipe, County Auditor.

STREET IMPROVEMENTS

Selma, Ala.—Paving of portion of Broad st. is being considered.

Tuscaloosa, Ala.—Council has ordered City Engineer to ask for bids for proposed street paving.

Fullerton, Cal.—Council is considering election on \$178,000 bonds for improvement of streets.

Napa, Cal.—Council has decided to macadamize and curb portions of Polk, Seymour, North Seminary, Clary and West 3d sts.; work will be done by George Errington and will cost about \$9,000.

Riverside, Cal.—City will grade, macadam and oil Mulberry st.; also construct cement curb and concrete gutter.—W. V. Darling, Superintendent of Streets.

Santa Monica, Cal.—Paving of Ocean ave. is being considered by Council.

Pueblo, Col.—Work will at once begin on extension of Grand ave.

Hartford, Conn.—Board of Finance is considering \$4,739 appropriation for macadamizing Whitney st. and \$2,000 for Capitol ave.

Washington, D. C.—District Commissioners have asked Congress for authority to build municipal asphalt plant.

Brooksville, Fla.—Citizens have voted \$18,000 bonds for street improvements.

Palatka, Fla.—Council is considering election on \$12,500 bonds for additional vit. brick paving.

Perry, Ga.—Houston County Commissioners of Roads and Revenues are considering \$100,000 bond issue for improving roads and bridges.

Evansville, Ind.—Board of Public Works is considering improvement of McCormick ave. with asphalt.

Fort Wayne, Ind.—Board of Public Works has ordered plans prepared for paving 15 additional streets.

Indianapolis, Ind.—The Board of Public Works has confirmed resolution for improving Locke st., Walnut st. to Indiana ave.; estimate of cost prepared by City Engineer Klausmann is \$10,100.

New Orleans, La.—State Board of Engineers has rejected bids received for proposed highway from Colfax to Rochelle via Droug, Selma and Georgetown, Grant Parish; bids were received for two kinds of road, labeled No. 1 and No. 2; for No. 1 it was stipulated that the timbers should be creosoted, concrete culverts, vit. pipe for sewers and other high-class materials; No. 2 road did not call for treated timber and instead of concrete culverts and vit. piping, it was stipulated that corrugated iron would be acceptable; road No. 1, J. W. Thompson, Jackson, Miss., \$107,290; A. L. Patterson & Co., New Orleans, \$98,768.20;

road No. 2, J. W. Thompson, \$82,936.60; A. L. Patterson & Co., \$76,445.76.

Rockville, Md.—Montgomery County Commissioners are planning to improve road from Rockville to Norbeck; distance of four and a half miles; work will be under supervision of M. Donaldson Knight, County Road Superintendent.

Gloucester, Mass.—Board of Aldermen has adopted order appropriating \$2,500 for improvement of East Main st.

Lowell, Mass.—Committee on Streets has voted to recommend loan of \$75,000 for paving.

Southbridge, Mass.—Contract will soon be let for paving Hamilton St.; \$23,000 is available.

Detroit, Mich.—Commissioner of Public Works J. J. Haerer will soon ask bids for paving several streets and alleys, estimated at \$14,000.

Lexington, Mo.—Citizens have voted \$125,000 bonds for road improvements.

Reno, Nev.—Commissioners of Washoe County are considering matter of building a road from Reno along banks of Truckee River to Nevada State line.

Merchantville, N. J.—Citizens are considering improvement of streets.

Paterson, N. J.—Board of Freeholders will expend about \$55,000 on roads.

Perth Amboy, N. J.—County will again macadamize State st. from the point where

avement stops in the northern section of city to Woodbridge creek; distance about one mile; Amboy ave. will receive similar treatment from New Brunswick ave. at high Valley tracks to Woodbridge, distance of about five miles.

Rahway, N. J.—Bids will soon be asked for paving Main st.

Trenton, N. J.—County Engineer Eppel has estimated cost of properly repairing and resurfacing county roads at \$180,000.

Rochester, N. Y.—Board of Aldermen is considering following improvements: Ave. B asphalt pavement, estimated cost \$28,000; Dewey ave. asphalt pavement, \$22,000; Lake View Terrace asphalt pavement, \$6,000; Raines Park asphalt and brick pavement and sewer, \$26,000; Park ave. asphalt pavement, \$16,000; Roosevelt st. asphalt pavement, \$3,900; Pinnacle road asphalt pavement \$10,000; Conkey ave. brick pavement, \$25,000; Weaver st. brick pavement, \$8,000; Seward st. asphalt pavement, \$34,000; Post and Bingham sts. asphalt pavement, \$12,000; Ashland st. asphalt pavement, \$8,000; Alpine st. macadam pavement, \$4,500; Goldsmith place asphalt pavement, \$3,000.

Utica, N. Y.—Mayor Gillmore has recommended resurfacing of asphalt streets.

Cincinnati, O.—Supervisor of Roads Mills has prepared plans for proposed road from independence to Ryland; cost \$2,400.

Girard, O.—Council has decided to ask for bids for building sidewalk and cross walks.

Maple Grove, O.—Township will vote May 2 on \$10,000 bonds for construction of five miles of stone roads.—W. Yakiin, Township Clerk.

Pittsburg, Pa.—Department of Public Works will soon ask bids for improvement of Eighteenth st. road.

Columbia, S. C.—Council is considering paving of Sumter st. with bitulithic and Hampton and Washington sts. with wooden blocks.

Sumter, S. C.—City will expend \$25,000 on improvements on its main street.—W. Worring Lee, Engineer.

Chattanooga, Tenn.—Main st. will be paved with 14-ft. center of brick, flanked on each side by 11-ft. strip of bitulithic or some similar substance; Main st., in St. Elmo, will be paved with brick to point near the cemetery gate, and from that point, Georgia ave., St. Elmo, will be paved with bitulithic or some similar substance to end of street car line.

McMinnville, Tenn.—Warren County will vote May 6 on \$100,000 additional bonds to extend pikes.

Waverly, Tenn.—Citizens have defeated proposition to issue \$100,000 bonds to build roads.

Brady, Tex.—District No. 1, McCullough County, will at once engage engineer to make surveys and estimates for macadamizing roads; \$75,000 bonds voted; district is 10 miles wide and 20 miles long; bids will soon be asked; Committee, Lee Jones, Chairman, will have direct charge of work under County Commissioners. A. M. Martin can be addressed.

Dallas, Tex.—City Commissioners have decided to place two concrete culverts on Haskell and San Jacinto and on Haskell near Ross; cost \$3,085.

Dayton, Tex.—Dayton precinct of Liberty County will vote May 23 on \$275,000 of bonds for construction of shell road.

Longview, Tex.—Citizens have voted \$90,000 bonds for paving business streets, electric lighting, etc.—G. A. Bodenheim, Mayor.

M. Kirkes, 17c. earth, 59c. rock; W. I. Mason, 29c. earth, 18c. fill, 95c. rock; A. F. Moberly, 24c. for earth and 92c. for rock; E. L. Haralson, 30c. for earth and 90c. fill; paving with asphaltic macadam Oak lane, from 14th to Exposition, J. A. Gregory, \$1.32 per sq. yd.; Standard Engineering and Construction Co., \$1.35, or without excavation to subgrade, \$1.28; F. O. Brown, \$1.34; paving 3d ave., Texas and New Orleans to Parry, F. O. Brown, \$1.34 per sq. yd.; J. A. Gregory, \$1.32; Standard Engineering and Construction Co., \$1.35, or without subgrade excavation, \$1.28; 2d ave., from Santa Fe to Grand, F. O. Brown, \$1.34, or without subgrade excavation, \$1.26; J. A. Gregory, \$1.32; Standard Engineering and Construction Co., \$1.35, or without subgrade excavation, \$1.28.

Galveston, Tex.—Bulkheading, surfacing and paving of the road from the west end of Broadway to Causeway; Suderman & Dolson, 13,400 cu. yds. of shell in place \$1.64 per cu. yd., \$21,976; 9,000 cu. yds. soil in place, \$1.49 per cu. yd., \$13,490; creosoted lumber in place, 60,000 ft., \$60 per 1,000 ft., \$3,600; total for entire work, \$38,986; F. Freund, shell, \$1.64 per cu. yd., \$21,976; soil, \$1.52 per cu. yd., \$13,680; lumber, \$58.50 per 1,000 ft., \$3,510; total, \$39,166; Hanson Sons, shell, \$1.64 1/2, \$22,043; soil, \$1.45 1/2, \$13,005; lumber, \$59.50, \$3,570; total, \$39,518; J. C. Kelso, shell, \$1.69, \$22,646; soil, \$1.44, \$12,960; lumber, \$30, \$1,800; total, \$37,406.

Portsmouth, Va.—Improving streets in Sixth Ward; F. J. McGuire, paving County st., from Chestnut to Blount, exclusive of the Norfolk and Portsmouth Traction Co.'s share, with Mack brick, \$1.55 per sq. yd.; Porter brick, \$1.50; laying 5-in. granite curbing on County and Glasgow sts., 58c. per lin. ft.; paving County st., Blount to Rose, and Glasgow to County st., the Air Line turnpike, with tarvia bituminous paving on 8-in. base, \$1.34; with asphalt, \$1.44; grading County st., \$5,000; Pearl st., \$5,000; Glasgow st., \$3,000; paving Traction Co.'s share of County st., \$2,500; Dabry-Nottingham Co., laying 5-in. granite curbing in Glasgow st., 60c. per lin. ft.; grading in Glasgow st., \$3,000; E. Park Lindsay, paving County st., Chestnut to Blount st., with brick, excepting the Norfolk and Portsmouth Traction Co.'s share, \$1.60 per sq. ft.; County st., Blount to Rose st. with tarvia macadam, 8-in. base, \$1.92 1/2 per sq. yd.; add 10c. per sq. yd. for asphalt; same figures apply to Glasgow st.; traction work, add 10 per cent to cost of material and labor; grading Pearl st., \$1,039; County st., Blount to Rose st., \$1,207; Glasgow st., \$2,431; laying 5-in. granite curbing in County st., Chestnut and Blount st., 59 1/2c. per lin. ft.; in County st., Blount and Rose, 62c. per lin. ft.; in Glasgow st., 60c. per lin. ft.

SEWERAGE

Florence, Ala.—City is considering construction of storm sewers at estimated cost of \$12,000.

Ashburn, Ga.—Citizens will vote on \$20,000 bonds for construction of sewer system and water-works.

Barnesville, Ga.—Citizens have voted \$15,000 bonds to extend sewerage, electric light and water systems.

Lawrence, Kan.—Council has decided to construct storm sewers on Euclid and New Hampshire sts.

Ridgely, Md.—Town Council has decided to build a sewerage system; outlet will have to be run nearly four miles to reach nearest creek.

Rockland, Mass.—E. R. Studley, Town Clerk, has been appointed Chairman of Committee to report on proposed construction of sewer system.

Detroit, Mich.—Board of Estimates has allowed \$195,229 appropriation for new sewers.

Amory, Miss.—Citizens have voted \$65,000 bonds for installing sewerage and water-works.—E. C. Dalrymple, City Clerk.

Elizabeth, N. J.—Council has ordered construction of sewer in Jersey ave.—Edw. Nugent, President.

BIDS RECEIVED

Trenton, N. J.—Council is considering construction of sewers on three streets.—H. B. Salter, City Clerk.

Syracuse, N. Y.—Council has adopted ordinance offered by Alderman Davis declaring intention to construct several sewers in Ninth Ward.

Gresham, Ore.—Bids for construction of sanitary sewerage system will be received about May 29.—L. C. Kelsey, Selling Bldg., Portland, Engineer.

Hillsboro, Ore.—Plans, specifications, etc., have been prepared by Louis C. Kelsey, Civil Engineer, Selling Bldg., Portland, for sanitary and storm sewerage systems and street pavements; sewerage systems are estimated to cost \$83,247.90 and the pavements \$59,355.75; separate contracts will be let for the sewerage and the street paving, and bids for construction will be invited about June 1.

Newport, Ore.—Estimated cost of sanitary sewerage system, according to plans and specifications prepared by Louis C. Kelsey, Consulting Engineer, Selling Bldg., Portland, is \$64,023.83; bids for construction will be invited during the coming summer.—F. B. Davis, City Engineer.

East Aurora, N. Y.—Furnishing material and labor for construction of sewer system, including sewage disposal plant, as follows: (a) sewer, (b) disposal plant, (c) sewer and disposal plant; Moore & Smith, Buffalo, N. Y., (b) \$29,265; Baker Owen Construction Co., Johnstown, Pa., (a) \$104,831; Albert Gaffey, Syracuse, N. Y., (b) \$26,922; (c) \$120,458; Duronithic Co., Buffalo, N. Y., (b) \$33,065; Williams & Knowlson, Grand Rapids, Mich., (b) \$26,859, (c) \$118,157; Hydro Construction Co., Buffalo, N. Y., (b) \$29,577; Busch & Percival, Buffalo, N. Y., (b) \$29,228, (c) \$129,509; Alfred C. Bame, Lancaster, N. Y., (b) \$21,719; John E. Johnson & Co., Buffalo, N. Y., (a) \$91,865; Cusano & Dower, Niagara Falls, N. Y., (a) \$88,730; John D. Kuhn, Greensburg, Pa., (a) \$76,325; James Duff Construction Co., Cleveland, O., (b) \$24,370, (c) \$115,888; Joseph F. Slabele Co., Buffalo, N. Y., (b) \$21,730, (c) \$101,848; Gray & Miller, Hornell, N. Y., (a) \$79,657; Republic Engineering and Construction Co., Buffalo, N. Y., (b) \$24,400, (c) \$99,757.

power plant.—James M. Patten, City Clerk.

St. Cloud, Minn.—Mayor P. J. Sebergen has recommended installation of filtration plant.

Taconite, Minn.—Duluth Eng. Co., Duluth, has been selected as engineer for proposed water-works; cost about \$15,000.

Amory, Miss.—City voted \$65,000 bond issue for installing water-works and sewerage.—E. C. Dalrymple, City Clerk.

Helena, Mont.—Construction of the municipal water works plant, C. L. Morris Construction Co., Seattle, Wash., \$618,840; Adams Bros. & Co., Helena, \$648,419; P. E. McHugh, Tacoma, Wash., \$646,000; Engineer's estimate, \$606,000; the Helena Water Works Co., April 17, made offer of its plant, complete, for \$400,000, which is \$190,000 less than the offer of March 6; Council has rejected all bids in order to consider offer.—Charles W. Helmick, City Engineer.

Pacific, Mo.—The Fuller-Coult Co., Chemical Bldg., St. Louis, is making profiles and estimates for water-works.

Pleasant Hill, Mo.—Council has granted 20-year franchise to C. W. Dobbins for construction of water-works; proposes to construct dam.

Diller, Neb.—D. F. Sturdevant, Holdrege, Engineer, will supervise installation of water works plant.

Maimo, Neb.—Citizens have voted bonds for installation of water works.

Central Valley, N. Y.—Commonwealth Water Co., New York, is considering installation of chemical filter.

Cortland, N. Y.—Board of Water Commissioners is preparing to build 1,000,000-gal. standpipe or water storage tank at top of Court House hill; George F. Cooper and Grove T. Mason are committee to prepare plans and specifications for both open hearth and ingot iron construction, as well as of any other material they will recommend.

Portland, N. Y.—E. A. Wilder, Fredonia, will prepare preliminary plans and estimates for diversion channel around present impounding reservoir with necessary dams and connections; estimated cost, \$15,000 to \$20,000.

Sodus, N. Y.—Installation of water-works is being considered.

Concord, N. C.—City has \$50,000 bond issue available for construction of water-works.

Petersburg, N. D.—Citizens have voted \$6,000 bonds for installation of water works system.

Kenton, O.—Bids will be asked about June 1 by the city for constructing partly new and remodeling old water works.—Charles Brossman, Indianapolis, Ind., Engineer; V. H. May, Superintendent Water Works.

Springfield, O.—City will ask for bids for material for proposed water works force main and for the supply of pipe for season.—George Cotter, Superintendent Water Works.

McAlester, Okla.—Citizens have voted \$80,000 additional bonds for water works improvements.

Oklahoma City, Okla.—National Board of Fire Underwriters has recommended replacing dam with one of permanent construction; installation of two additional high-lift pumps; installation of two additional boilers and extension of distribution system.

Oklahoma City, Okla.—Bids for proposed new sedimentation basin at water works plant, to take care of extra amount of water consumed during summer months, have been rejected, because they exceeded estimates of Vincent G. Shinkle, Superintendent of the department, who prepared them; will be readvetised; bidders were: Hunter & Hunter, \$13,130; John A. Johnson, \$14,587; Fielder & Co., \$13,992; J. W. Smith & Co., \$13,800; Oklahoma City Construction Co., \$16,500; Stokes Construction Co., \$14,630; Illinois Concrete Machine Co., \$32,400; Black & Laird Construction Co., \$15,930; George H. Keifer, \$13,917.

Soper, Okla.—City will receive bids on 110 tons c. i. pipe, 30,000-gal. steel tank on tower, deep-well geared pump, 12-hp. gasoline engine, 10 hydrants, valves, etc.—H. Hughes, City Clerk.

Soper, Okla.—Citizens have voted bonds for installation of water works system.

Gresham, Ore.—Bids for construction of the water works distributing system and sanitary sewerage system will be received about May 29.—Louis C. Kelsey, Selling Bldg., Portland, Ore., Engineer.

Haines, Ore.—Citizens have voted \$20,000 bonds to install water works system.

North Bend, Ore.—Mayor has authorized J. L. Stannard, Portland, to prepare plans and specifications for municipal water-works to supply both Marshfield and North Bend.

Franklin, Pa.—Council has passed resolution for construction of city water main to Oak st. in Tentk Ward at estimated cost of \$4,735.

West Middlesex, Pa.—Borough Council has formulated plans for probable construction of sewage disposal plant and taken steps toward having town sewerred. (Incorrectly given in April 19 issue as West Midland.)

Aliquippa, Pa.—Architect Owens, Beaver, is drawing plans for sewage system and sewage disposal plant, which will be brought before the Council in a short time. William Anderson, Aliquippa, has been selected as Engineer.

Waco, Tex.—Election on bonds for additional sewers is being considered.

Blacksburg, Va.—Citizens will vote May 16 on \$12,000 bonds to install sewerage and water systems.

Elma, Wash.—Louis C. Kelsey, Civil Engineer, Selling Bldg., Portland, Ore., has been employed by city to prepare plans, specifications and estimates for installing sewerage system.

Oakesdale, Wash.—Council is considering installation of septic tank and sewer system.

Mount Vernon, N. Y.—Construction of a sewer in East Lincoln ave., Louis Petrillo, \$13,518; Sabino Guarino, \$12,760; Smith Bros., \$11,912; Tony Lougo, \$12,489; James Piro, \$11,087; Charles Motolla, \$10,750; Frank Nordone, \$12,970; Inter-Urban Development Co., \$14,917; Charles Sillery & Sons, \$11,950.

Nashville, Tenn.—John Broderick was lowest bidder for building sewer in alley 268, \$1,177.

Prince Albert, Sask., Can.—Constructing main intercepting sewer: Wm. Newman Co., Ashdown Block, Winnipeg, Man., \$83,234; Maudeas Bros., 541 Front St., Edmonton, Alta., \$120,987; John Craig, Prince Albert, \$125,667; Power Construction Co., Saskatoon, \$126,828; Flannagan & Dunphy, Dauphin, Man., \$144,700, and Parsons Const. & Eng. Co., Regina, Sask., \$165,428; work includes following: 13,031 lin. ft. concrete egg-shaped sewer, 4 to 4 ft. 6 in.; 355 junctions, 16 manholes, 2 penstock manholes, 462 lin. ft. 18-in. pipe sewers, 1 manhole on pipe sewer; cast iron for manholes and penstocks and sewer pipe for 18-in. sewer are supplied by city; all other materials and labor is supplied by contractors; average depth of trench, 12½ ft.

power plant.—James M. Patten, City Clerk.

St. Cloud, Minn.—Mayor P. J. Sebergen has recommended installation of filtration plant.

Taconite, Minn.—Duluth Eng. Co., Duluth, has been selected as engineer for proposed water-works; cost about \$15,000.

Amory, Miss.—City voted \$65,000 bond issue for installing water-works and sewerage.—E. C. Dalrymple, City Clerk.

Helena, Mont.—Construction of the municipal water works plant, C. L. Morris Construction Co., Seattle, Wash., \$618,840; Adams Bros. & Co., Helena, \$648,419; P. E. McHugh, Tacoma, Wash., \$646,000; Engineer's estimate, \$606,000; the Helena Water Works Co., April 17, made offer of its plant, complete, for \$400,000, which is \$190,000 less than the offer of March 6; Council has rejected all bids in order to consider offer.—Charles W. Helmick, City Engineer.

Pacific, Mo.—The Fuller-Coult Co., Chemical Bldg., St. Louis, is making profiles and estimates for water-works.

Pleasant Hill, Mo.—Council has granted 20-year franchise to C. W. Dobbins for construction of water-works; proposes to construct dam.

Diller, Neb.—D. F. Sturdevant, Holdrege, Engineer, will supervise installation of water works plant.

Maimo, Neb.—Citizens have voted bonds for installation of water works.

Central Valley, N. Y.—Commonwealth Water Co., New York, is considering installation of chemical filter.

Cortland, N. Y.—Board of Water Commissioners is preparing to build 1,000,000-gal. standpipe or water storage tank at top of Court House hill; George F. Cooper and Grove T. Mason are committee to prepare plans and specifications for both open hearth and ingot iron construction, as well as of any other material they will recommend.

Portland, N. Y.—E. A. Wilder, Fredonia, will prepare preliminary plans and estimates for diversion channel around present impounding reservoir with necessary dams and connections; estimated cost, \$15,000 to \$20,000.

Sodus, N. Y.—Installation of water-works is being considered.

Concord, N. C.—City has \$50,000 bond issue available for construction of water-works.

Petersburg, N. D.—Citizens have voted \$6,000 bonds for installation of water works system.

Kenton, O.—Bids will be asked about June 1 by the city for constructing partly new and remodeling old water works.—Charles Brossman, Indianapolis, Ind., Engineer; V. H. May, Superintendent Water Works.

Springfield, O.—City will ask for bids for material for proposed water works force main and for the supply of pipe for season.—George Cotter, Superintendent Water Works.

McAlester, Okla.—Citizens have voted \$80,000 additional bonds for water works improvements.

Oklahoma City, Okla.—National Board of Fire Underwriters has recommended replacing dam with one of permanent construction; installation of two additional high-lift pumps; installation of two additional boilers and extension of distribution system.

Oklahoma City, Okla.—Bids for proposed new sedimentation basin at water works plant, to take care of extra amount of water consumed during summer months, have been rejected, because they exceeded estimates of Vincent G. Shinkle, Superintendent of the department, who prepared them; will be readvetised; bidders were: Hunter & Hunter, \$13,130; John A. Johnson, \$14,587; Fielder & Co., \$13,992; J. W. Smith & Co., \$13,800; Oklahoma City Construction Co., \$16,500; Stokes Construction Co., \$14,630; Illinois Concrete Machine Co., \$32,400; Black & Laird Construction Co., \$15,930; George H. Keifer, \$13,917.

Soper, Okla.—City will receive bids on 110 tons c. i. pipe, 30,000-gal. steel tank on tower, deep-well geared pump, 12-hp. gasoline engine, 10 hydrants, valves, etc.—H. Hughes, City Clerk.

Soper, Okla.—Citizens have voted bonds for installation of water works system.

Gresham, Ore.—Bids for construction of the water works distributing system and sanitary sewerage system will be received about May 29.—Louis C. Kelsey, Selling Bldg., Portland, Ore., Engineer.

Haines, Ore.—Citizens have voted \$20,000 bonds to install water works system.

North Bend, Ore.—Mayor has authorized J. L. Stannard, Portland, to prepare plans and specifications for municipal water-works to supply both Marshfield and North Bend.

Franklin, Pa.—Council has passed resolution for construction of city water main to Oak st. in Tentk Ward at estimated cost of \$4,735.

CONTRACTS AWARDED

Calxico, Cal.—To Watson & Spicer, Colorado Springs, Col., for construction of sewers, \$26,650.

Chicago, Ill.—Building sewers, to Mich. Pontorelli, 4817 W. Dakin st.; to C. Roberts, 7565 Taylor st.; to J. Savaino, 732 Ewing st.; to Simon Ryan, 2927 W. Congress st.; to C. Fosco, 814 Desplaines st.

Evansville, Ind.—Building Morton ave. sewer, to Frank Megear, 52c. per ft.; \$18 for manholes and \$26 for inlets.

Richmond, Ind.—To Hipskind & Son, Wabash, for installation of sanitary sewer.

Allegan, Mich.—Building sewers, to Peter De Witt, 36 Hope and st., Grand Rapids, \$2,798.82; other bidders: G. W. Edwards, Milan, \$3,376; Swanson Co., Chicago, Ill., \$3,799.40; C. R. Meeks, city, \$3,780.50; Lewis Jagnau, Jackson, \$3,678.20; Hotan & Roach, South Bend, Ind., \$7,747.80; Geo. A. Lowry, Saginaw, \$3,447.85; J. A. Brown & Co., city, \$3,494.—John W. Peete, City Clerk.

Rochester, Minn.—Constructing sewers in Broadway, 4th and 7th sts., to Fraser & Danforth, city, \$6,363.

Roselle, N. J.—Extension of Fifth ave. sewer into Aldene section, to T. Foster Callahan, \$7,317.15; other bidders: Matthew Wade, Elizabeth, \$7,921; Louis Jaques, Elizabeth, \$8,555.55; Martin & Miller, Seneca Falls, N. Y., \$8,731.53.

Albany, N. Y.—Laying sewers in three streets, to John M. Holler, \$784.80, \$1,382.40 and \$2,026.50.

East Aurora, N. Y.—Building sewers, to the Republic Engineering Construction Co., Buffalo, \$75,139.00; disposal plant, to A. C. Bame, Lancaster, N. Y., \$21,719.20.—Alfred Brotherhood, Village President.

Hempstead, L. I., N. Y.—To Cyril Marshall, Hempstead, by Trustees of Village, for construction of proposed sewer system.

Rochester, N. Y.—Building sewer in Rockland st., to F. V. Brotsch, \$1,376.75; Lime st., to Rochester Vulcanite Pavement Company, \$4,965.50.

Schenectady, N. Y.—Laying sanitary sewers in two streets, to John Nolan, city.

Springfield, O.—To Huncker & Williams for construction of Elmwood sewer, about \$14,000.

Providence, R. I.—Pacasset ave. sewer, to Chas. Crankshaw, \$5,666; Elk st., to Gammino & Roberts, \$13,824; Union ave., Tell st. and President ave. sewers, to W. A. Gamino; total \$8,053; sewers on Langham road, 10th and Geneva sts., to F. E. Shaw, \$4,379.

Seattle, Wash.—Building Virginia st. trunk sewer, circular brick, to B. N. Graff, American Bank Bldg., \$14,614.20.

Milwaukee, Wis.—Building 3d st. relief sewer, to R. J. Hickey, \$45,802.

WATER SUPPLY

Attala, Ala.—Etowah Light & Power Co. will improve water and electric light systems at cost of \$50,000; 20-year franchise has been granted.

Gadsden, Ala.—Citizens have voted \$50,000 bonds for water works improvements.

Washington, D. C.—Inquiry has been received by American consular officer in Mexico for names and addresses of American manufacturers of cast iron pipes and iron pipes.—Address No. 6568, Bureau of Manufactures.

Fort Lauderdale, Fla.—Water-works system will be installed during year.—W. H. Marshall, Mayor.

Ashburn, Ga.—Citizens will vote on \$20,000 bonds for construction of water-works and sewer system.

Barnesville, Ga.—Citizens have voted \$15,000 bonds to extend water, electric light and sewerage systems.

Oglethorpe, Ga.—City will construct water-works; bids will be opened about July 1; engineer not selected.—C. A. Allison is interested.

Swainsboro, Ga.—Citizens have voted \$40,000 bonds to install water works and electric lights.

Preston, Ida.—Citizens have voted bonds for installation of municipal water works system.

New Athens, Ill.—Village Board has passed ordinance for construction of system of water works.

Sterling, Ill.—Sterling Water Co. will make extensions to system throughout city; cost, \$75,000.—J. D. Arey, City Engineer.

Evansville, Ind.—Water Works Board has recommended installation of 16-in. water main in Adams ave. at cost of \$12,000.

Leesburg, Ind.—Establishment of water works system is being considered.

Baxter, Ia.—Citizens will vote on \$10,000 bonds for installation of water works.

Roland, Ia.—Citizens have voted \$10,000 bonds for installation of water works system.

Sioux City, Ia.—Council has rejected bids for pump for Morningside station; new bids will be asked.

Sully, Ia.—Citizens have voted \$8,500 bonds for installation of water supply system.

Vail, Ia.—Citizens have voted bonds for installation of water works system.

Amesbury, Mass.—Town has sold \$12,000 water bonds.

Hastings, Mich.—Citizens have voted \$120,000 bonds for construction of a water

power plant.—James M. Patten, City Clerk.

St. Cloud, Minn.—Mayor P. J. Sebergen has recommended installation of filtration plant.

Taconite, Minn.—Duluth Eng. Co., Duluth, has been selected as engineer for proposed water-works; cost about \$15,000.

Amory, Miss.—City voted \$65,000 bond issue for installing water-works and sewerage.—E. C. Dalrymple, City Clerk.

Helena, Mont.—Construction of the municipal water works plant, C. L. Morris Construction Co., Seattle, Wash., \$618,840; Adams Bros. & Co., Helena, \$648,419; P. E. McHugh, Tacoma, Wash., \$646,000; Engineer's estimate, \$606,000; the Helena Water Works Co., April 17, made offer of its plant, complete, for \$400,000, which is \$190,000 less than the offer of March 6; Council has rejected all bids in order to consider offer.—Charles W. Helmick, City Engineer.

Pacific, Mo.—The Fuller-Coult Co., Chemical Bldg., St. Louis, is making profiles and estimates for water-works.

Pleasant Hill, Mo.—Council has granted 20-year franchise to C. W. Dobbins for construction of water-works; proposes to construct dam.

Diller, Neb.—D. F. Sturdevant, Holdrege, Engineer, will supervise installation of water works plant.

Maimo, Neb.—Citizens have voted bonds for installation of water works.

Central Valley, N. Y.—Commonwealth Water Co., New York, is considering installation of chemical filter.

Cortland, N. Y.—Board of Water Commissioners is preparing to build 1,000,000-gal. standpipe or water storage tank at top of Court House hill; George F. Cooper and Grove T. Mason are committee to prepare plans and specifications for both open hearth and ingot iron construction, as well as of any other material they will recommend.

Portland, N. Y.—E. A. Wilder, Fredonia, will prepare preliminary plans and estimates for diversion channel around present impounding reservoir with necessary dams and connections; estimated cost, \$15,000 to \$20,000.

Sodus, N. Y.—Installation of water-works is being considered.

Concord, N. C.—City has \$50,000 bond issue available for construction of water-works.

Petersburg, N. D.—Citizens have voted \$6,000 bonds for installation of water works system.

Kenton, O.—Bids will be asked about June 1 by the city for constructing partly new and remodeling old water works.—Charles Brossman, Indianapolis, Ind., Engineer; V. H. May, Superintendent Water Works.

Springfield, O.—City will ask for bids for material for proposed water works force main and for the supply of pipe for season.—George Cotter, Superintendent Water Works.

McAlester, Okla.—Citizens have voted \$80,000 additional bonds for water works improvements.

Oklahoma City, Okla.—National Board of Fire Underwriters has recommended replacing dam with one of permanent construction; installation of two additional high-lift pumps; installation of two additional boilers and extension of distribution system.

Oklahoma City, Okla.—Bids for proposed new sedimentation basin at water works plant, to take care of extra amount of water consumed during summer months, have been rejected, because they exceeded estimates of Vincent G. Shinkle, Superintendent of the department, who prepared them; will be readvetised; bidders were: Hunter & Hunter, \$13,130; John A. Johnson, \$14,587; Fielder & Co., \$13,992; J. W. Smith & Co., \$13,800; Oklahoma City Construction Co., \$16,500; Stokes Construction Co., \$14,630; Illinois Concrete Machine Co., \$32,400; Black & Laird Construction Co., \$15,930; George H. Keifer, \$13,917.

Soper, Okla.—City will receive bids on 110 tons c. i. pipe, 30,000-gal. steel tank on tower, deep-well geared pump, 12-hp. gasoline engine, 10 hydrants, valves, etc.—H. Hughes, City Clerk.

Soper, Okla.—Citizens have voted bonds for installation of water works system.

Gresham, Ore.—Bids for construction of the water works distributing system and sanitary sewerage system will be received about May 29.—Louis C. Kelsey, Selling Bldg., Portland, Ore., Engineer.

Haines, Ore.—Citizens have voted \$20,000 bonds to install water works system.

North Bend, Ore.—Mayor has authorized J. L. Stannard, Portland, to prepare plans and specifications for municipal water-works to supply both Marshfield and North Bend.

Franklin, Pa.—Council has passed resolution for construction of city water main to Oak st. in Tentk Ward at estimated cost of \$4,735.

McKeesport, Pa. Board of Water and Lighting Commissioners is considering rebuilding of pumping station.—D. M. White, Superintendent.

Wyomissing, Pa.—Council will consider \$60,000 bond issue for municipal water and light plant.

York, Pa.—Water Co. has decided to spend \$15,000 to extend trunk line through northern and western sections of the city.

Hearne, Tex.—Citizens have voted bonds to install water works.

Port Lavaca, Tex.—W. E. Shell has petitioned City Commissioners for franchise for water-works and electric light system.

Princeton, Tex.—Princeton Water-Works Co. will expend \$7,500 on water-works construction; erect engine and pump house; install 10-hp. oil engine and 20,000-gal. tank.

Blacksburg, Va.—Citizens will vote May 16 on \$12,000 bonds to install water and sewerage systems.

Christiansburg, Va.—Citizens have voted \$10,000 bonds to install water works.

Rocky Mount, Va.—Citizens will vote June 14 on \$50,000 bonds to establish and operate water works and electric light plant.

Elma, Wash.—Louis C. Kelsey, Civil Engineer, Selling Bldg., Portland, Ore., has been employed by city to prepare plans, specifications and estimates for increasing water supply by means of pumping and for installation of sewerage system.

Tacoma, Wash.—Bids will be asked at once for construction of 54-in. stove pipe line from main reservoir at McMillan to Wright ave. and J st. and for construction of telephone line along pipe line.

Independence, Wis.—Water system will be installed; \$3,500 bonds issued.

Monticello, Wis.—Consulting Engineer W. G. Kirchoffer, Madison, has been employed to prepare plans for water works system, consisting of 8,000 ft. of 6-in. and 8-in. c.-i. pipe; a concrete reservoir or elevated tank, one deep well and a power pump; plant will be operated by engine and boilers now located in electric light plant.

Niagara-on-the-Lake, Ont., Can.—Village is planning to install water works at cost of \$21,500.

CONTRACTS AWARDED

Chicago, Ill.—Furnishing and laying water service pipes, to Jas. T. Renn, 367 W. Chicago ave.; to Daniel Hardin, 3139 Indiana ave.; to David Walsh, 6628 S. Chicago ave.; furnishing and laying c.-i. water supply pipes, to Simon Ryan, 2927 W. Congress st.; to M. Murphy, 5315 Wabash ave.

Nevada, Ia.—To Guy E. Smith, Indianola, for constructing water-works.

Baltimore, Md.—By Board of Awards, for laying 27,000 ft. of water pipe for Fire District No. 2 and setting of 35 hydrants; to Daniel O'Connell Sons, to erect pumping station.

Alexander, Minn.—To W. B. Bosworth, Ada, by city, for construction and installation of water mains in 6th ave.

Duluth, Minn.—Laying 19,714 ft. of water pipe and 19,930 ft. of gas pipe; Crescent View extension, Woodland ave. to Crescent View Park, 4,382 ft. 8-in. water and 4-in. gas pipe and 2,770 ft. 6-in. water and 4-in. gas pipe, to J. Bergman, \$3,141.44; total estimated cost, \$14,000; Fourth alley force main, 2,040 ft. 20-in. water and 8-in. gas pipe, to Pastoret-Lawrence Co., \$2,694.80; total estimated cost \$9,767.38; 1,008 ft. 6-in. water and 4-in. gas mains, to Woodland, Johnson & Johnson, \$651.84; total estimated cost, \$1,720; 540 ft. 6-in. water and 4-in. gas mains in 43d ave. West, to Adam McAdams, \$313.20; total estimated cost, \$868; 2,350 ft. 6-in. water and 4-in. gas mains in Lewis st. and Dunnedin ave., Hunters' Park, to Johnson & Johnson, \$1,518.68; total estimated cost, \$3,650; also smaller contracts, to J. Bergman, J. W. Preston and Adam McAdams.

Hastings, Neb.—To Ingersoll-Rand Co., Chicago, to furnish for the city pumping station new air compressor of a capacity of 1,193 ft. of air per minute.

St. Paul, Neb.—To J. P. Johnson & Son, St. Paul, for the construction of extensions to water works; materials for the work have already been purchased.

Rochester, N. Y.—Laying water pipes in streets comprising group 247, to Wm. H. Sours, Second, \$23,882.

Troy, N. Y.—To the McDonough Construction Co., of Troy, for construction of the Martin-Dunham reservoir and spillway, \$15,276; to Ludlow Valve Mfg. Co., for valves; to R. D. Wood & Co., Philadelphia, Pa., for c.-i. pipe.

Cincinnati, O.—Service Director Sundmaker for wash water pumps and motors

for filtration plant, to L. G. Flindlay & Co., \$3,110.

Salt Lake City, Utah.—To P. J. Moran, for construction of city's water main extensions during 1911; only other bid submitted was that of J. W. Percival.

Seattle, Wash.—Laying water mains on Grand Blvd., to John Contracting Co., Leary Bldg., \$16,408.60.

Richland Center, Wis.—To the Heine Chimney Co., Chicago, Ill., for erection of chimney.

BIDS RECEIVED

Tucson, Ariz.—Construction of a reinforced concrete standpipe, plain and ornamental finish; Geo. Cook & Co., \$16,150 and \$16,564, respectively; V. S. Griffith, \$16,450; Piedmont Construction Co., \$17,750 and \$19,590; Petterson & Schmidt, \$18,250 and \$18,955; Welch & Co., \$20,000; Barman Construction Co., \$23,116.

Fort Baker, Cal.—By Major George McK. Williamson, Q. M., U. S. A., for reconstructing pump house, installing machinery, erecting a steel tank and laying 6-in. water main at Fort Baker, (a) for entire work, (b) reconstructing pump house, (c) installing machinery, (d) steel tank, (e) 6-in. water main; Braun, Williams & Russell, 503 Market st., (d) \$2,795; F. C. Roberts & Co., 461 Market st., (a) \$14,725; American Construction Co., 359 Monadnock Bldg., (b) \$3,160, (d) \$3,564, (e) \$4,485; Compressed Air Machinery Co., Stevenson & Ecker, (a) \$18,838, (b) \$2,723, (c) \$6,765, (d) \$4,987, (e) \$4,143; Duncanson Harrison, 1407 Chronicle Bldg., (a) \$22,890, (b) \$6,985, (c) \$6,895, (d) \$4,445, (e) \$5,900; H. W. Moffit & Co., Oakland, Cal., (a) \$15,994; Butte Engine and Electric Co., 683 Howard st., (a) \$17,178, (b) \$2,288, (c) \$5,500, (d) \$4,102, (e) \$5,288; Pringle, Dunn & Co., 338 Pine st., (a) \$15,477, (b) \$1,947, (c) \$5,225, (d) \$4,262, (e) \$4,480; Nelson Bauer, Metropolitan Bank Bldg., (a) \$18,075, (b) \$3,250, (c) \$5,032, (d) \$4,095, (e) \$4,985; Michael Murphy, Berkeley, Cal., (e) \$4,750; Chambers & Heafey, Oakland, Cal., (a) \$16,141, (b) \$2,905, (c) \$4,980, (d) \$3,600, (e) \$4,956; George E. Dow, 410 Sheldon st., (c) \$4,850; Sampson Iron Works, Stockton, Cal., (c) \$4,575; all bidders of San Francisco unless otherwise stated.

Washington, D. C.—Furnishing pipe, etc., c.-i. water pipe: Item (1) 811 tons 16-in., (2) 1,125 tons 20-in., 9-in. thick, (4) 475 tons 20-in., 6-in. thick, (3) 90 tons (a) specials on standard specifications, (b) on bidder's specifications; U. S. Cast Iron Pipe and Foundry Co., New York, Items (1-3) \$22.84, (4) \$54.84; Standard Cast Iron Pipe and Foundry Co., Bristol, Pa., Items (1-2) \$24.80, (3) \$24.58; (4a) \$51.50; Lynchburg Foundry Co., Lynchburg, Va., Items (1-3) \$24.02, (4b) \$52.60; Camden Iron Works, Camden, N. J., Items (1-3) \$24.02, (4b) \$52.60. Cocks: Item (1) 4,000 ¾-in. corporation cocks, (2) 200 1½-in. corporation cocks, (3) 250 ¾-in. lead corporation cocks, (4) \$4,250 ¾-in. iron curb cocks, (5) 150 ¾-in. lead and iron curb cocks; H. Mueller Mfg. Co., New York, (1) 60,75c., (2) \$2.40, (3) 71.5c., (4) 77c., (5) 77c.; 82.5c. on solid curb cocks; A. P. Smith, East Orange, N. J., (1) 59c., (2) \$1.96, (3) 62c., (4) 72c., (5) 77c.; Walworth Mfg. Co., Boston, Mass., (1) 67c., (4) 85.6c.; Glauner Brass and Mfg. Co., Cleveland, O., (1) 56.5c., (2) \$2.18, (3) 86c., (4) 81c., (5) 82c.; Hayes Mfg. Co., Erie, Pa., (1) 58.5c., (2) \$2.22, (3) 58c., (4) 63c., (5) 63c.

Fulton, N. Y.—Furnishing 300 tons of 18-in. and 70 tons of 14-in. pipe, and 1,200 lbs. of 14-in. and 5,000 lbs. of 18-in. Standard castings; Charles Millar & Son Co., Utica, N. Y., \$21.40 per ton for pipe, and \$50 per ton for special castings; U. S. Cast Iron Pipe and Foundry Co., \$21.40 and \$50.

Niles, O.—Installing clear well and filtration plant; Youngstown Construction Co., Youngstown, \$63,390; Louis Adavaslo & Co., Youngstown, \$47,400; W. H. Ralston, Mt. Vernon, \$48,900; Ensminger Co., Columbus, \$34,455; Niles Lumber Co., Niles, O., \$48,300; Falken Electric Co., Chicago, \$73,500; Clarendon Construction Co., Wilmington, N. C., \$49,086; Roberts Filtr. Mfg. Co., Philadelphia, Pa., \$49,100; Pitts Construction Co., Pittsburg, Pa., \$46,000; the American Water Softening Co., Philadelphia, Pa., \$57,239.50; R. P. Burnett, Geneva, O., \$41,000; Pittsburg Filter Co., Pittsburg, Pa., \$48,865; W. N. Henderson, Youngstown, \$45,225; furnishing the pumps, Harris Pump and Supply Co., Pittsburg, \$2,760; Goulds Mfg. Co., Seneca Falls, N. Y., \$4,130; the Allis Chalmers Co., Milwaukee, \$3,100; the Drava-Doyle Co., Cleveland, \$3,240; Henry R. Worthington, Cleveland, \$2,940; Lathrop & Dollier Co., Philadelphia, \$3,670; Jeansville Iron Works Co., Broadway, N. Y., \$2,802.27; Platt Iron Works Co., Dayton, O., \$2,687.

Norwalk, O.—Furnishing 12, 10, 8, 6 and 4-in. water pipe and special castings to be used for construction of the water pipe extensions on Woodlawn ave., Corwin, East

Manh, Chatham and St. Mary's sts., Buckeye Engineering Co., Norwalk, lowest bidder, \$23.25 per ton.

Lebanon, Pa.—Furnishing horizontal, cross-compound crank and flywheel condensing cross-compound pumping engine of 2,500,000-gal. capacity per 24 hours, (a) with foundation, (b) without foundation, (c) duty in millions of foot lbs. per 1,000 lbs. dry steam; Snow Pump Works, Buffalo, N. Y., (a) \$14,075, (b) \$13,500, (c) 122; Allis-Chalmers Co., Milwaukee, Wis., (a) \$16,650, (b) \$15,100, (c) 118; Platt Iron Co., Dayton, O., (a) \$14,140, (b) \$13,548, (c) 115.

Pittsburg, Pa.—Mission st. pumping station building and appurtenances; William Kerr's Sons, Lewis Bldg., Pittsburg, \$93,200; Golden & Crick, \$94,194; W. T. Powell, \$94,358.

Dallas, Tex.—Furnishing three 250-hp. boilers for White Rock reservoir; John O'Brien Boiler Works Co., St. Louis, \$8,800; Oil City Boiler Works, Oil City, Pa., by M. P. Wolfe, \$9,895; Smith & Whitney, \$10,300; E. Keeler Co., Williamsport, Pa., by John G. Hunter, \$8,529; Babcock & Wilcox Co., New Orleans, \$13,715; Randall-Lovegrove-Wyman, Houston, \$9,615; Casey Hedges Co., Chattanooga, by A. G. Wright, \$9,636; Briggs-Weaver Machinery Co., \$8,750; Walsh & Weidner Boiler Co., Chattanooga, \$8,960.

Tacoma, Wash.—Building McMillan Reservoir and pipe line, the remaining units of the Green River gravity water system; Pipe Line—Pacific Coast Pipe Co., \$767,927.75; Nisqually Contract Co., \$771,711.67; E. W. Kibler, \$778,356.64; Morris Construction Co., \$784,316; John Construction Co., \$790,432.74; P. E. McHugh, \$798,453.37; Sound Construction Co., \$810,208.89; International Contract Company, \$858,846.26; Reservoir—Nelson Bennett, \$289,589.22; Northwest Contract Co., \$297,144.96; Robert Wakefield Co., \$304,328.40; United Reservoir Construction Co., \$309,754.81; Keasal Construction Co., \$305,794.52; Sound Construction Co., \$326,200.62; Nisqually Contract Co., \$328,752.43; Morris Contract Co., \$342,403.66; International Contract Co., \$349,856; Lister Construction Co., \$302,062.62.

LIGHTING AND POWER

Attala, Ala.—Etowah Light & Power Co. will improve electric light and water systems at cost of about \$50,000; 20-year franchise has been secured.

Hawthorne, Cal.—Board of Supervisors has formed lighting district.

Los Angeles, Cal.—Better street lighting in the southeast section of the city is recommended to Board of Public Works by R. H. Manahan, City Electrician.

Los Angeles, Cal.—Board of Supervisors has refused Southern California Gas Co.'s application for franchise giving it privilege of laying gas pipes on all highways of county.

Quincy, Cal.—President O. C. Pratt, of Indian Valley Power Co., now supplying Greenville, has announced that line will be extended immediately to Taylorsville and Crescent Mills; plant will be enlarged and two towns lighted by electricity this summer.

Sacramento, Cal.—Citizens Light and Power Co. has been incorporated by Geo. Peltier to construct generating plant and supply electric current for light and power, also gas; capital, \$2,500,000.

Georgetown, D. C.—Georgetown Gaslight Co. is planning to build plant costing about \$500,000.

South Jacksonville, Fla.—Citizens have voted \$60,000 bonds for construction of electric light system and water works.—R. O. Moore, Chairman, Board Bond Trustees.

Atlanta, Ga.—Atlanta Hydro-Electric Power Co., 1014 Candler Bldg., is completing plans for construction of water-power electrical plant; \$3,000,000 will be expended for construction of high dam and power house, installation of machinery for developing 30,000 hp., and construction of transmission line to city.

Barnesville, Ga.—Citizens have voted \$15,000 bonds to extend electric light, water and sewerage systems.

Buchanan, Ga.—City will construct electric light plant.—G. N. Moore and H. S. McCalman, Committee in Charge of purchase and installation.

Oglethorpe, Ga.—City will open bids about July 1 for electric light and water plants construction; engineer not selected. C. A. Allison is interested.

Elwood, Ind.—Bacon-Olds Co. will build artificial gas plant in city.

Marion, Ind.—Board of Public Works has passed resolution granting to John L. McCulloch, city, a petition to furnish citizens artificial gas at price of \$1 per thousand cu. ft.

Muncie, Ind.—Martin Sears and L. Dunham, Yorktown, are working on organization of electric lighting company to furnish

light to incorporated towns of Daleville, Chesterfield and Yorktown, and to farmers between these towns.

Bonaparte, Ia.—J. A. Johnson and others are considering installation of electric light plant.

Fort Dodge, Ia.—Council has passed motion instructing City Engineer Reynolds to run level from city pumping station north for one-half mile to determine feasibility of dam for municipal power purposes.

Humboldt, Ia.—Northern Roller Milling Co. and the Humboldt Electric Light and Power Co., both operated under the same management, will at once build concrete dam across Des Moines River, and will also construct large power house near present one; about \$80,000 will be spent; plant will develop 1,200 horsepower.

Milo, Ia.—Citizens have voted bonds for establishment of municipal gas lighting plant.

Lake Charles, La.—J. S. Connolly, Carthage, Mo., will petition Council for franchise for gas plant.

Shreveport, La.—Council has decided to have estimate made of probable cost of electric light plant.

Chestertown, Md.—Council has granted franchise for gas plant in town.

Brainerd, Minn.—Council has adopted resolution asking Water and Light Board to expend \$1,800.75 for rectifier system of street lighting.

Minneapolis, Minn.—Dr. P. M. Hall, Health Commissioner, is preparing plans for enlarging city incinerating plant and increasing number of the electric generators so as to enable the plant to supply enough electricity to light up workhouse, Hopewell hospital, and 20 miles of streets in vicinity of workhouse.

St. Vincent, Minn.—Installation of electric light plant at cost of \$4,000 is being considered.

Wabasha, Minn.—Plans are being considered for establishment of the Minnesota Wisconsin Power Co. to furnish light and power to the cities of Wabasha, Lake City, Red Wing, Hastings and Winona; current will be furnished from the plant in this city, which will be enlarged to meet the increased demand.

Tupelo, Miss.—Citizens have voted \$50,000 to improve electric light plant, pave streets, etc.

Bloomfield, N. J.—Mayor Hauser has recommended installation of municipal electric light plant.

Madison, N. J.—Repairs, alterations and increased equipment for the local electric lighting plant that will total \$18,000, plus fees for preparing plans and supervising construction, have been outlined in report submitted to Council by New England Engineering Co.

Newark, N. J.—Committee on Municipal Lighting is planning to extend city hall lighting plant in order to light public buildings at cheaper rate.

Vincetown, N. J.—Water Co. is considering installation of generator to supply electricity for lighting town.

Albany, N. Y.—Proposition of the Municipal Gas Co. to light streets of the city of Albany for a period of five years from June 21 has been unanimously rejected by Board of Contract and Supply.

Binghamton, N. Y.—Council has asked Board of Estimate that \$250 be appropriated to procure services of electrical engineer to make plans for boulevard lighting and placing wires in conduits.

Oxford, N. C.—Oxford Electric Co. has been incorporated, \$15,000 capital stock, by A. H. Powell, of Oxford; Richard C. M. Calvert, of College Park, Md., and Charles F. Nesbit, of Washington, D. C., to furnish electric power and lighting and gas.

Dickinson, N. D.—Hughes & Deiters, owners of electric light plant, are planning extensive and permanent improvements.

Akron, O.—The Northern Ohio Traction and Light Co. has decided to develop water power on the Cuyahoga River near this city; Consulting Engineer H. von Schon, Detroit, Mich., is preparing plans.

Kingfisher, Okla.—Citizens have voted \$28,000 bonds for enlargement of electric light plant and extension of water-works; electric light system will be changed from single-phase to three-phase.—V. H. Francis, Superintendent of Light and Water plant.

Steelton, Pa.—Steelton Light, Heat and Power Co. is considering erection of auxiliary plant having 400-hp. dynamo.

Union City, Pa.—Keystone Electric Light Co. has been granted franchise to erect poles and string wires in streets; will build electric light plant. L. D. Shreve is interested.

Wyomissing, Pa.—Council will consider \$60,000 bond issue for municipal light and water plant.

Columbia, S. C.—Columbia Gas Light Co. is considering improvements to system.

Edgefield, S. C.—Citizens will vote May 18 on \$15,000 bonds for electric light plant.

Granbury, Tex.—Granbury Water, Ice, Light & Power Co., James W. Hockaday, Manager, desires 100-hp. power gas producer and engine.

Hearne, Tex.—Citizens have voted bonds to install electric lights.

Longview, Tex.—Citizens have voted \$90,000 for electric lighting facilities, paving, etc.—G. A. Bodenheim, Mayor.

Port Lavaca, Tex.—W. E. Shell has petitioned City Commissioners for franchise for electric light system and water works.

Temple, Tex.—J. A. Walker, 4210 Lafayette st., Dallas, desires prospective plans, specifications and construction bids on complete gas plant; 100,000 cu. ft. capacity; 50,000-ft. holder; five miles main, 8, 6, 4, 2-in.

Troup, Tex.—R. C. Schumate, Zephyr, has purchased electric light plant and will improve.

Rocky Mount, Va.—Citizens will vote June 11 on \$50,000 bonds to establish and operate electric light plant and water works.

La Crosse, Wis.—Plans for construction of fourth dam and another power house are being prepared by La Crosse Water Power Co.

Sun Prairie, Wis.—Citizens will vote May 9 on \$9,000 bonds for installation of electric light plant.

CONTRACTS AWARDED

Pasadena, Cal.—To S. M. Kerns, Los Angeles, to construct underground conduit system for electric light and telephone wires on South Orange Grove ave., \$33,700.

Taunton, Mass.—Lighting naphtha lights at northern end of the city, viz., Bassett, Fremont, Field and other streets, to James Barry, \$2,400.

Jackson, Tenn.—Furnishing generator and arc lamps, to the General Electric Co., of Schenectady, N. Y., and engine, to Hoover, Owens, Rentschler Co., Hamilton, O.; total cost, \$14,750.

Galveston, Tex.—Supplying fifty-set transformer and twenty-five new arc lamps, to the General Electric Company.

BIDS RECEIVED

Baltimore, Md.—McKay Engineering Co., 10 East Lexington st., is lowest bidder for installing ornamental lampposts about City Hall plaza and Key monument.

Seattle, Wash.—Furnishing machinery for Lake Union plant generator: Westinghouse Electric Co., \$9,424; Fort Wayne Electric Works, \$9,558; S. Morgan Smith Co., Eates & Clark Co., \$9,987; E. P. Jamison & Co., \$12,480; Water wheel: the Platt Iron Works Co., \$7,690; E. P. Jamison & Co., \$7,500; Pelton Water Wheel Co., \$6,350 and \$6,670.

FIRE EQUIPMENT

East Holly, Cal.—Council is considering purchase of chemical engine.

Ocean Park, Cal.—City Clerk Watt will receive bids for auto truck for city fire department within two weeks.

New Britain, Conn.—Fire Chief R. M. Done has recommended purchase of 500 ft. of 3/4-in. hose and equipment of truck with ladders.

Stratford, Conn.—Fire house will be erected at Nichols and Johnson aves. Wm. Clements is interested.

Bridgeville, Del.—Volunteer Fire Department is considering erection of \$3,000 fire house.

Dalton, Ga.—City has purchased site on Pentz st. for erection of combined fire headquarters and city hall.

Sterling, Ill.—Bids will soon be asked by Fire and Water Committee for combination auto fire truck carrying ladders and hose.

Princeton, Ind.—Council is considering purchase of fire engine.

Neola, Ia.—Council has decided to erect fire engine house.

Baltimore, Md.—City will erect engine house in near future at Light and Montgomery sts.

Greenfield, Mass.—Town has appropriated \$6,000 to purchase motor-propelled combination chemical and hose wagon.

Gloucester, Mass.—Town is considering purchase of flying squadron.

Swampscott, Mass.—Town has appropriated \$6,000 for purchase of auto chemical and hose wagon.

St. Cloud, Minn.—Mayor P. J. Sebergers has recommended erection of engine house.

Waterloo, Neb.—Citizens have voted \$15,000 bonds for better fire protection.

Westfield, N. J.—Fire Committee is considering purchase of auto apparatus.—J. A. Dennis, Mayor.

Old Forge, N. Y.—Village is considering erection of combined engine house and municipal building.

Sauquoit, N. Y.—Purchase of chemical engine is being considered.

Syracuse, N. Y.—Fire alarm ordinance has been adopted without opposition by

Council and early action will be taken to contract for installation of central office equipment.

Troy, N. Y.—Council has passed ordinance for purchase of truck.

Columbus, O.—Mayor Marshall is favorable to purchase of auto fire apparatus.

Boyetown, Pa.—Keystone Fire Co. will purchase fire engine.

Dunmore, Pa.—Plans for erection of two new fire houses are being prepared by Architect P. J. Morris, of Scranton.

Lansford, Pa.—Council has decided to install borough electric fire alarm system.

Harrisburg, Pa.—Council is considering purchase of 2,500 ft. of fire hose.

Pottstown, Pa.—Council is considering purchase of modern truck for Empire Hook and Ladder Co.

Sellersville, Pa.—Fire company has been organized.—Fred Shubert, Chief.

Sellersville, Pa.—Council has agreed to furnish equipment for local fire company, and proper building will be erected.

Seven Valleys, Pa.—Fire company has been organized.—H. S. Behler, Chief.

Columbia, S. C.—Engine house will be erected at once at 1112 Green st.

Fort Worth, Tex.—Plans for expending \$45,000 in equipping adequate police and fire alarm system have been approved by Commission.

Spokane, Wash.—Fire Commissioners are considering election on \$100,000 bonds for extension and improvements in fire department.

Tacoma, Wash.—Council is considering purchase of site in Indian addition for erection of fire house.

Montreal, Que., Can.—Board of Control has ordered erection of two fire stations.

CONTRACTS AWARDED

Hartford, Conn.—Building 55-ft. water tower, to American-La France Fire Engine Co., Elmira, N. Y., \$6,000.

Lawrence, Mass.—Furnishing auto combination chemical and fire truck, to Knox Automobile Co., Springfield, \$5,500.

New York, N. Y.—By Board of Estimate, to Star Electric Co., Binghamton, N. Y., for installation of several thousand dollars' worth of fire-alarm boxes.

BIDS RECEIVED

Chico, Cal.—Furnishing automobile engine, Pope-Hartford, \$5,500; Rambler, \$5,250; Webb Motor Fire Apparatus Co., \$5,750; Gorham Engineering and Fire Apparatus Co., makers of the Seagrave chemical engine, three bids, \$5,105, \$5,055, \$5,755; White, \$4,590; Knox, new, \$5,980; used, \$5,630; Kissel, \$5,300.

St. Paul, Minn.—Furnishing motor-driven squad wagon: Waldref-Odel Motor Car Co., \$6,000; Webb Motor Fire Apparatus Co., \$5,000; Knox Automobile Co., \$5,600; Robinson Fire Apparatus Co., \$5,500; P. J. Downes Co., \$5,000; Waterous Engine Works, \$5,500; American-La France Fire Engine Co., \$5,500.

Paterson, N. J.—Changing of the hose wagons and engine apparatus attached to steamer companies Nos. 1 and 5; William J. Tynan sent in two bids, first for changing of the two hose wagons to motor propelled vehicles for the sum of \$7,300, and second for the same work, substituting Knox chassis for a Sampson chassis, \$6,000; Hughes Garage Co., on a Kelly truck chassis, \$7,000; James Boyd & Sons, two hose wagons, \$6,375; Seagrave Co. bid \$5,000 each for changing of two wagons and \$5,500 each for changing of the two engines; the Nott Fire Engine Co. offered to install universal chassis similar to that in present use in the motor propelled steam fire engine in New York department for the sum of \$6,000 for each engine; Couple Geering Co., New York, offered to install electric driven tractor for engines at a cost of \$5,500 each; Victor Motor Truck Co., for engines, \$7,000; Webb Motor Fire Apparatus Co. bid on 75-hp. hook and ladder motor-propelled truck, \$12,600.

Hamilton, O.—Furnishing auto trucks and other fire department equipment: Auto trucks, West Side Motor Co., two trucks, \$4,300 each without equipment or \$1,950 with equipment; American-La France Co., Elmira, N. Y., \$5,200 and \$5,000; Seagrave Co., Columbus, \$7,800 and \$8,250 for two trucks, ladder wagon, aerial, \$5,000; Hamilton Motor Car Co., \$7,000 for two or \$3,500 for one truck; Central Motor Car Co., one motor wagon, \$5,000. Hose: Bi-Lateral Fire Hose Co., Chicago, \$1, 95c., 90c. and 80c. per ft. for 3,100 ft., according to brand; J. R. Muddon, Dayton, made general bid on clay pipes, nozzles, gate valves, etc.; Diamond Rubber Co., Akron, fire hose, \$1, 90c. and 80c. per ft.; Fabric Fire Hose Co., New York, \$1.10, \$1, 95c., 90c. and 85c. per ft.; Boston Woven Hose and Rubber Co., 90c. and 85c. per ft.; Eureka Fire Hose Co., New York, \$1.10, \$1, 90c., 95c. and 85c. per ft.

South Bethlehem, Pa.—Supplying 1,000 ft. of Fire Hose: Hudson Mechanical Rubber Co., No. 1, 69½ cts. per ft.; No. 2, 52½ cts.; No. 3, 46 cts.; No. 4, 34 cts., all coupled; B-Lateral Fire Hose Co., Progress, double jacket, \$1.10 per ft.; Ohio, double jacket, \$1, coupled; Mineralized Rubber Co., double jacket, 78 cts., and 90 cts., coupled; Goethers Rubber Manufacturing Co., 1-ply Conqueror, \$1.10; Overall, \$1; Kearney brand, \$1; double jacket, 90 cts.; C. C. C. Fire Hose & Rubber Co., Gold Standard, \$1; Canton Special, \$1; Standard, 90 cts.; Independence brand, solid rubber, \$1.10; Gutta Percha & Rubber Manufacturing Co., Ajax, 75 cts.; Princeton, \$1.20; Allstate Cross, \$1.25; Baker Fabric, \$1.20; Baker Fabric, \$1; Princeton, double jacket, 95 cts.; Rescue brand, 85 cts.; Burka Fire Hose Manufacturing Co., 3-ply jacket, \$1; Fabric Fire Hose Co., Keystone, \$1; Patrol, \$1; Safety, 95 cts.; Arrow, 90 cts.

BRIDGES

San Jose, Cal.—Plans for four new county bridges have been ordered by the Board of Supervisors and the replacing of bulkheads torn out by the recent floods authorized.

Perry, Ga.—Houston County Commissioners of Roads and Revenues are considering \$100,000 bond issue for improving bridges and roads.

Shreveport, La.—Bids will be asked soon by the Shreveport Commissioners for constructing traffic bridge over Red River; cost \$250,000.—George Wilson, City Engineer; Ira G. Hedrick, Kansas City, Mo.

Minneapolis, Minn.—Tentative arrangements for construction of three new bridges in Minneapolis and widening of the Plymouth ave. bridge have been made by Council Roads and Bridges Committee; Gov. A. O. Eberhart has signed \$850,000 bridge bond bill.

Albany, N. Y.—State Engineer Benschel has prepared plans for construction of portion of Schuylerville bridge; cost is estimated at \$23,553; bids will be asked at once.

Marborough, N. Y.—Citizens will vote May 12 on \$3,000 appropriation for bridge at Main and Landing sts.

Dayton, O.—Council is considering construction of bridge across hydraulic race at Spurling ave.

Hugo, Okla.—Citizens have voted \$120,000 bonds for bridges.

Janesville, Wis.—Mayor John C. Nichols has recommended erection of bridge across Racine st.

CONTRACTS AWARDED

Paducah, Ky.—Constructing reinforced concrete bridge, 43 ft. wide and 295 ft. long, to J. A. Omburg, Memphis, Tenn., \$30,600; other bidders: Foy-Proctor Co., Nashville, Tenn., \$39,062; L. W. Hancock Co., Louisville, Ky., \$35,770; Standard Concrete Construction Co., Chicago, Ill., \$32,700; Nashville Bridge Co., Nashville, Tenn., \$31,800; Davis-Hoys Construction Co., Paducah, \$33,339.

East Las Vegas, N. M.—To the Missouri Valley Bridge and Iron Works, of Leavenworth, Kan., by Board of County Commissioners, for erection of three new bridges to be constructed by the county this year, \$14,000.

Niles, O.—To Western Reserve Lumber Co., Warren, for building of Squaw Creek Bridge at Mosier lane, \$3,898 plus 40c. per cu. yd. for excavation and \$6.62 per cu. yd. for extra concrete work as ordered by Engineer.

Portland, Ore.—Reconstruction of county bridge in West Portland district, by the County Court to P. W. White, 928 East Couch st., \$2,650.78.

Easton, Pa.—By Northampton County Commissioners for a bridge over the Lehigh River at foot of 3d st., to Ferro Concrete Co., Harrisburg, \$109,950.

Reading, Pa.—Building bridges: Bordner's bridge, No. 1, over Tulpehocken Creek, seven miles from Rosensonia, to Carl R. Cramp, Harrisburg, \$6,925; other bidders: Nelson Meredith Co., Chambersburg, \$8,185; J. O. Sherry Co., Wyomissing, \$9,007; Ferro Concrete Co., Harrisburg, \$7,149; H. E. Ahrens Co., Reading, \$7,027; Bordner's bridge, No. 2, crossing the Swatara Creek about six miles from Myers-town, to H. E. Ahrens Co., Reading, \$6,290; other bidders: Nelson Meredith Co., Chambersburg, \$6,500; J. O. Sherry Co., Wyomissing, \$8,480; Ferro Concrete Co., Harrisburg, \$6,950; Willauer & Co., Pottstown, \$6,897.50.

Yardley, Pa.—Constructing concrete arch bridge over Delaware River at Yardley, to the F. M. Talbot Co., 1 Madison ave., New York, N. Y., about \$500,000.

Memphis, Tenn.—Shelby County Commissioners, to Memphis Bridge Co., to construct bridge over Hatchie River at Pite ave., \$13,945 for bridge at Bell's Switch,

\$3,698; for structure at Walnut ave., near White Station, \$2,285, and for structure at Hurricane Creek, near Bartlett, \$2,995; to W. P. Allen, to build bridge over Big Creek, \$3,197.

Milwaukee, Wis.—Building fender pilings around Chestnut and State st. bridges, to A. E. Bines for Chestnut st., \$375; and to J. E. Hathaway, for other, \$2,220.

BIDS RECEIVED

Indianapolis, Ind.—Construction of concrete slab bridge across Pogues run, at Highland ave.: H. F. Hackborn, \$6,785; Hease-Buzzart Construction Co., \$7,500, and the American Construction Co., \$8,200. The estimate of City Engineer Klausmann was \$7,756.

Niagara Falls, N. Y.—Building approaches for proposed new bridge over the New York Central tracks at 11th st.: Braas Bros., \$59,887; Reed-Coddington Co., \$86,950; Eastern Construction Co., \$30,155; J. E. Johnson Co., \$26,000.

MISCELLANEOUS

Opelika, Ala.—Dr. Wm. N. Oates, State Prison Inspector, has recommended immediate erection of jail for Lee County.

Los Angeles, Cal.—Swimming pools and a general children's playground on side of Griffith Park, toward Tropic, are suggested by J. B. Lippincott Park Commissioner.

Niles, Cal.—Board of Supervisors will ask for bids for auto for Sheriff's office.

Niles, Cal.—Board of Supervisors has decided to erect brick jail.

Willows, Cal.—C. N. Russell, San Francisco, has been selected as architect for proposed \$25,000 city hall.

Pueblo, Col.—Board of Works will purchase four street washers.

Naugatuck, Conn.—Warden W. J. Neary has recommended erection of new police headquarters.

Washington, D. C.—An American Consular officer in Canada has announced that local City Engineer is considering purchase of motor type of dump wagon of about 3 tons capacity; also a motor tank wagon for street sprinkling purposes; vehicle should be adapted for use on hilly streets; engineer is anxious to receive as soon as possible catalogues and illustrations, prices to be quoted delivered in certain city. Address No. 6589, Bureau of Manufactures.

Dalton, Ga.—City has purchased site on Pentz st. for erection of combined city hall and fire headquarters.

Macon, Ga.—Architect will shortly be commissioned to draw plans for erection of building on Cotton ave. for Water Works Commissioners.

Fort Wayne, Ind.—Mayor Grice has recommended more funds for street cleaning.

Fort Wayne, Ind.—River Front Commission has recommended the employment of Morrison P. Eddy, of firm of Metcalf & Eddy, of Boston, to report plan for disposal of the sewage, also plans for dams in the river to make boating possible, and George E. Kessler, of St. Louis, as Landscape Engineer.

Markle, Ind.—Citizens are urging installation of garbage disposal plant.

Noblesville, Ind.—Council is considering \$20,000 bond issue to purchase site and erect city building.

South Bend, Ind.—Architect E. R. Austin is preparing plans for building for Zoo planned by Park Board.

Catlettsburg, Ky.—City hall has been destroyed by fire.

Winchester, Ky.—Grand Jury has recommended erection of jail for Clark County.

Baltimore, Md.—Architects Archer & Allen have prepared plans for erection of \$20,000 public bath house at Greenmount and Harford aves.

Gloucester, Mass.—County Commissioners are considering erection of addition to jail and house of correction.

New Bedford, Mass.—Board of Health has rejected second proposal of New Bedford Extractor Co. to dispose of city's garbage from years 1914 to 1921 at annual cost of \$7,500.

Duluth, Minn.—Board of Public Works has advertised for bids for improvement of the Quebec pier at Bay end of Becker ave.; cost about \$6,000.

Leseoeur Center, Minn.—County Board has decided to erect county jail.

Dassel, Minn.—Citizens will vote on bonds for erection of village hall.

Tupelo, Miss.—Citizens have voted \$50,000 bonds to build city hall, improve electric light plant and pave streets.

Mexico, Mo.—Citizens have voted \$15,000 bonds to erect almshouse.

St. Louis, Mo.—E. E. Wall, Water Commissioner, has recommended revetment of river banks at cost of \$150,000; also new joint boiler house for the engines at Bissell's Point.

Central City, Neb.—Merrick County will vote May 31 on erection of \$100,000 court house; plans being prepared.

Springfield, N. J.—Springfield Township is considering erection of municipal building.

Old Forge, N. Y.—Village is considering erection of combined municipal building and engine house.

Hugo, Okla.—Choctaw County has voted \$125,000 bonds for erection of court house and jail.

Philadelphia, Pa.—Architect D. K. Boyd, 139 S. 15th st., has prepared plans for erection of \$10,000 public library at 5th and Elisworth sts.

Darlington, S. C.—Oakes & Lamotte desire addresses of manufacturers of and dealers in metal and porcelain numbers and signposts for city street names; also catalogues.

Anahuac, Tex.—Chambers County will vote June 20 on \$43,000 bonds to erect court house and jail.

Calvert, Tex.—Citizens have defeated proposition to issue \$25,000 bonds to erect city hall.

Galveston, Tex.—Contract will soon be let by V. E. Austin, Commissioner of Streets and Public Property, for construction of a trash and garbage incinerator; cost about \$7,155.

Salt Lake City, Utah.—Council will be furnished with plans and specifications for erection of two comfort stations; cost \$5,000 each.

Beckley, W. Va.—Raleigh County is considering erection of jail.

Milwaukee, Wis.—Council has appropriated \$5,000 to Park Board for needed improvements.

New Westminster, B. C., Can.—Citizens have voted \$200,000 bonds for garbage system, bridge and electric light plant extensions, etc.—John Lee, Mayor.

CONTRACTS AWARDED

Long Beach, Cal.—Constructing combined bulkhead and sidewalk with parapet of reinforced cement concrete on Seaside blvd., from Chestnut pl. to jetties at ocean channel entrance, to J. D. Kneen Contracting Co., \$110,985; other bidders: J. C. Beer, \$120,000 and \$122,947; A. S. Bent, \$140,000; J. W. Young, \$121,499.

Asbury Park, N. J.—By the Public Grounds Commission for construction of a bathing plant and pool on the east side of Ocean ave., between 1st and 2d aves, to J. R. Taylor & Co., city, \$8,000; other bidders: Frank N. Goble, \$89,590; A. Whitehead, \$82,350; C. H. Peckworth, \$85,394; H. O. Gardner, \$82,088; J. A. Conklin, \$99,000.

New Brunswick, N. J.—Laying loose riprap under the retaining wall at Jamesburg, to Contractor John F. McGovern, city, lowest bidder; William I. S. Davison, of Cranbury, and Abraham Pelin, city, were other bidders.

Trenton, N. J.—Construction of a public comfort station at Cadwalader Park, to Joseph D. Smith & Son, low bidders, \$3,115, and Piper Bros., plumbing contract, \$1,730; other bidders: Andrew J. Trier, \$3,556; W. J. & J. H. Morris, \$3,175; Scott & Day, \$3,873; Stephen Dilkneit, \$3,325; P. J. O'Neill, \$3,468; S. W. Mather & Sons, \$3,398; Edward A. Lee, \$3,590; W. S. Hill & Son, \$3,326; plumbing, F. S. Katzenbach & Co., \$1,996; Greiner Plumbing Co., \$1,962; William Deekson, \$1,981.

Geneva, N. Y.—Sprinkling and flushing streets, to Edw. Higgins, \$100 per week for sprinkling and \$12.50 for flushing.

Philadelphia, Pa.—By Acting Director Hasskarl, of Department Docks, for dredging 40,000 cu. yds. of material from Delaware River, to American Dredging Co., 23½c. per cu. yd.

Seattle, Wash.—Collecting garbage in Dists. 1, 2, 3, 4 and 8, to C. E. Packard, E. 62d st. and Latonia ave.

BIDS RECEIVED

Boston, Mass.—By Metropolitan Park Commission, for construction of wooden landing piers in lower Charles River Basin, W. H. Ellis, Boston, \$8,885; George T. Rendle, Boston, \$7,545; Waldo Bros., Charlestown, \$7,380.

New York, N. Y.—Construction of a comfort station in Central Park near the Swiss Cottage, Richard Carvel Co., lowest bidder, 401 West 59th St., \$21,996.

Providence, R. I.—Oiling city streets: The Texas Co. bid on road oil in car tank lots. 3.65-100c. per gal.; the Daniels Road Oiling Co., East Providence, 1c. per sq. yd. on spraying with road oil, 4c. per sq. yd. on oiling with road oil for entire season, 3c. per sq. yd. for oiling with emulsion oil for season; the Standard Oil Co., Boston, 1¼c. per sq. yd. for spraying with road oil and for three treatments by spraying in season. 3¼c. per sq. yd.; 4.15-100c. per gal. was bid on road oil in car tanks and 5c. per gal. for emulsion in car tanks.

ICE MOUND IN LAKE, DIRECTLY OVER INTAKE

TORONTO WATERWORKS INTAKE TROUBLES

Six-Foot Steel Pipe Intake Stopped with Anchor Ice—Pipe Shifted by Ice—Later, Filled with Sand from Lake Bottom—Method of Cleaning—Difficulty Caused by Ice in Lake

In 1895, when the city of Toronto, Ont., found it necessary to increase the water supply, the plan was adopted of locating an intake in Lake Ontario and obtaining lake water through this. Immediately south of the waterfront is Toronto harbor and bay, which is navigable for about half a mile from the shore, and for $1\frac{1}{2}$ miles to 2 miles further south is shoal, there being a number of islands and a long bar and breakwater which furnish the southern protection to the harbor. The intake was located south of this shoal in water 65 feet deep and protected from any pollution from the harbor or the sewers discharging therein. It was proposed to construct the intake partly of steel pipe and partly in tunnel.

Between 1896 and 1898 2,357 feet of 6-foot steel pipe was laid from the intake to a crib on one of the islands known as the shore crib. For some reason nothing further was done in carrying out the plan until 1904, when a contract was let for 85 lengths of 6-foot steel pipe, completing the section from the intake to the south shaft of the tunnel which was proposed to complete the intake up to the pumping station. It was decided to tunnel for 5,087 feet under the bay for several reasons, among them the difficulty and cost of laying large

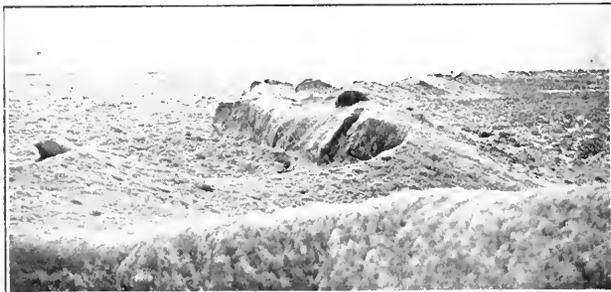

pipe across the harbor at a depth which would not obstruct future deep-water navigation, the expense of anchoring the same so as to permit of its being safely emptied and examined for leaks, and the impossibility of keeping out of it, while being laid, the sewage-contaminated mud which covered the bottom of the harbor to a depth of three or four feet. This tunnel was begun in the spring of 1906, and was carried through rock for the entire distance. It has a horseshoe section, lined with three rings of brick on the arch and side walls and having an invert of 1:2:4 concrete. The tunnel was completed in the latter part of 1908 and the pumps began taking water from the lake through the tunnel and steel pipe on January 1, 1909.

Early last winter it was found that severe easterly storms and a change in the formation of the sandy lake bottom which was probably caused thereby had resulted in the sand piling up within two or three feet of the top of the intake, which is 20 feet high. This was remedied by placing a large cylinder on the top of the intake, raising the same 10 feet higher.

A short time previous to this City Engineer C. H. Rust had recommended that an additional intake be constructed, prob-

ably because, among other objections resulting from too small an intake, the heavy consumption caused too great velocity of water flowing into it. In December last it was found that, owing to some stoppage in the intake or pipe, it was impossible to obtain sufficient water through them to keep the pumps going. Investigation revealed the fact that the pipe had been completely stopped by anchor ice, which had evidently formed along the shore in shallow water and been driven off by the wind to the vicinity of the intake, where it had been sucked in with the inflowing water. This ice was removed in two or three hours and pumping resumed.

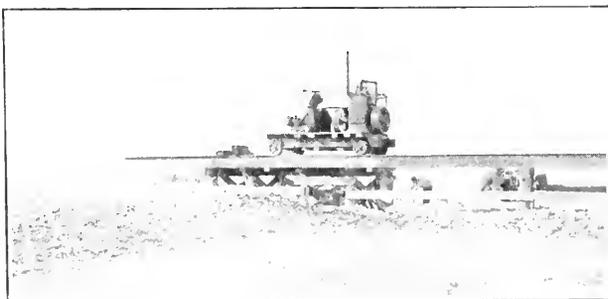

In February it was again found impossible to obtain sufficient water through the suction, which, in fact, appeared to have become completely stopped. An examination showed that a considerable length of the 6-foot steel pipe was completely choked with sand. As this difficulty could not be remedied in a few hours and it was necessary to continue the water

TYPICAL ICE BANKS, LOOKING WEST FROM INTAKE

supply, steps were immediately taken to let in a temporary supply of water from the bay. This was realized to be dangerous on account of the known pollution of the water of the bay, and it was realized that there was danger that typhoid fever would result from such use. The city already had an efficient system of applying hypochlorite, however, and especial pains and vigilance were exercised to sterilize the water by this means, and an outbreak of typhoid fever has been prevented.

Unfortunately, the entire lake along the shore was covered with a very heavy field of ice which prevented a thorough examination of the pipe for several days, there being an especially high mound of ice directly over the intake. When finally the authorities were able to reach and examine the intake they found that at a point about 600 feet from the shore a section of the pipe had risen from its bed and the flange had opened about 4 feet. It was thought probable that this had occurred in December. (Although no reason was suggested by our informant, Mr. Rust, it seems possible that this might have been caused by the partial emptying of the pipe during the trouble with anchor ice, thus increasing its buoyancy, which fact, combined possibly with a lessening of the depth of sand above the pipe due to the shifting of the bottom above referred to, may have resulted in a lifting of the pipe by flotation.) At a point 900 feet from the shore a section of pipe 150 feet in length had been carried out of line 20 feet at one end and 8 feet at the other. This Mr. Rust believed to have been the effect of the motion of a large and thick field of ice moved by a very heavy easterly gale.

CENTRIFUGAL PUMP OVER INTAKE

SAND PARTLY REMOVED FROM INTAKE

Steps were immediately taken to remove the sand from the intake pipe. This pipe follows practically the bottom of the lake, and thus slopes toward the intake crib. The method of removal adopted was to wash the sand down the pipe toward the crib, through which it was removed. One of the illustrations shows a centrifugal pump located on the ice over the intake, to be used in connection with this work. Another photograph shows the use of fire hose for loosening up and washing the sand toward the intake. Two or three weeks ago the pipe had not yet been entirely cleaned.

The work has been very difficult and arduous owing to the cold and rough weather. Three tugs, four divers, scows, etc. have been engaged constantly; but owing to the winter storm there have been some weeks during which it was possible to get in only about a total of 24 hours work.

These difficulties connected with lake intakes in northern climates should certainly be taken into consideration when considering or comparing proposed sources of supply where the alternative is between lakes and gravity supplies.

FLUSHING SAND TOWARD PUMP

CHEAPER STREET LIGHTING IN WICHITA

In his report for the year 1910 L. F. Means, Commissioner of Water and Lights of Wichita, Kan., states that the streets of that city are now illuminated with lamps giving a much superior light to that of previous years and at such a reduction in price as to enable the city to give an all-night service with many more lights than formerly, at a total expenditure less than in previous years. Formerly vapor lights were used, but in July of last year the Kansas Gas & Electric Company began a five-year contract substituting tungsten lamps for these. The same company also is supplying 117 electric arc lights of 2,000 candle-power for all-night service at \$66 per year per light, the same price formerly paid for lamps extinguished at 1 a. m. The city is using 850 80-watt tungsten lights, in addition to which the same company is furnishing 146 100-watt tungsten lights, which are paid for by the steam railways which cross the city, which also pay for the electric arc lights.

CHICAGO STREET PAVING REPORT

Organization of Street Department Complete and Efficient—
Specifications and Contracts Criticised—Concrete Foundations—Vehicle Tax

THERE has recently been published for distribution a report made to the Chicago Commission on City Expenditures last December by Samuel Whinery, of New York, on the general subject of the street pavements of that city. This report appears to have been made in a very fair and impartial spirit, a number of criticisms of present practice and recommendations being made therein, but the general tenor of the report being commendatory of the department. Concerning the nature of the work done Mr. Whinery states:

The organization in the department of the chief engineer of streets is quite complete and seems to be efficient. There are a large number of assistants and employees, but not more than are needed, with the possible exception of street inspectors. The system of blank forms in use is fairly complete, and the individual blanks for reporting and recording the progress and quality of the work and the quantity of materials used are sufficient, if properly used, for the purpose. It may be said, I think, that in this respect the Bureau is better and more intelligently equipped than those in most cities. Some of the methods and the procedure in carrying them into effect might be improved, and my impression is that the bookkeeping methods in the accounting department of the city, based upon this system of blank forms and reports, are not as complete and do not make note of details to the extent that they should.

I had many opportunities to examine street foundation concrete in Chicago, both while it was being laid and afterwards, before it was covered by the pavement. I found it very generally to be of excellent quality, averaging better than in most cities. The materials were clean and of good quality and mixing (by machine) well done.

Except in the matter of the oil used for the preservative treatment, the creosoted wood block pavement now being laid by the Board of Local Improvements is excellent. The blocks are more carefully and rigorously inspected than in most American cities. . . . The concrete foundation was good and the blocks were properly laid.

I was able to inspect on the streets a few asphalt pavements in progress in Chicago, but not to analyze or test carefully the materials used. On most of the work I saw the materials appeared to be satisfactory and the work of construction well done. In one case, however, I found the work very unsatisfactory. . . . On the whole, the asphalt pavements now being laid in Chicago are not up to the high standard of excellence that they should be; although it may also be said that they appear to be as good as the average in other cities, and they are probably as good as the city can hope to secure at prevailing prices, which are below a figure that would enable the contractor to do first-class work and make a reasonable profit on it.

I was able to examine but two brick pavements in course of construction. In these the brick was of excellent quality; they were laid with care and the joints were well filled with paving pitch of proper quality.

Mr. Whinery makes a number of suggestions in this report which are of equal interest to other cities, large and small, although a number of them would not receive the approval of all paving engineers and experts. One of the most important general criticisms is that

The same paving specifications and the same requirements are in nearly every respect made to apply to all pavements of one kind in the city, regardless of the conditions found on the individual streets. Thus, a 6-inch concrete foundation is specified for asphalt pavements, whether the street be one of the heaviest traveled in the heart of the city or a residence or suburban street carrying very light travel. Chicago is not, however, alone in this, since the same practice prevails in nearly all American cities. . . . On some of the heaviest traveled streets the concrete foundation should be 8 inches thick, while on a large percentage of the suburban or residence streets, where only a small quantity of the lightest character of travel needs to be provided for, a pavement with 4 inches of concrete foundation, one inch of binder and 1½ inches of surface would be ample and the cost would be but about three-fourths of the cost of the heavier standard.

It is specified that the sidewalk shall consist of 9 inches of foundation, 3½ inches of concrete base and ¾ inch of surface course. The main object of the 9 inches of cinders or other porous material in the foundation is to facilitate drain-

age, and thus prevent the heaving action of frost. It is useful for this purpose only when the porous foundation is quite free from water. Unless drainage is provided for the trench occupied by the porous material it may be filled with water and the purpose of the foundation defeated. The specifications do not provide for such drainage. This should be done by placing drain tiles to carry the water from low points to the nearest sewer inlet or to some other outlet, so that all water reaching the foundation shall be promptly carried away. If such drainage were provided it would not be necessary to make the foundation course more than 6 inches, which is sufficient to distribute the weight over the underlying soil.

The width of berm called for (one foot) is often not sufficient where the grade of the sidewalk is considerably above the natural surface of the ground. In many existing sidewalks that may now be seen in Chicago, this berm or bank of earth has been entirely washed away, or it has at least disappeared, so that the edge of the concrete is unsupported and sometimes projects more than a foot beyond the supporting earth. I would suggest that the width of this berm, at the grade of the sidewalk, be made twice the depth of the fill at each point. Thus, where the top of the sidewalk is one foot above the natural surface of the ground the berms should be 2 feet wide at grade.

Commenting upon the fact that the department has adopted practically all of the specifications recommended by the Association for Standardizing Paving Specifications, Mr. Whinery considers this unfortunate, as he believes these to be open to severe criticism in many respects. The most serious objections which he finds to them are in connection with the specifications for asphalt to be used in asphalt pavements, the description of the wood to be used for wood blocks and the oil to be used in treating the same. These will be referred to later.

Another general criticism which he makes is in connection with the right reserved in the contract to change plans and increase the amount of work. Concerning this he says:

In justice to the contractor and as a safeguard to the city, the power to increase or decrease the quantities of work for which unit prices are provided in the contract should be limited to a definite per cent of the quantities on which the contract is based. The latitude thus given should not exceed ten per cent either way. Any greater increase or decrease should be the subject of a supplemental contract. Within the units named the contract unit prices should apply to and cover all the work done.

The term "extra work" is necessarily indefinite. It is elastic and may be made use of to cover up a great quantity of crooked or questionable transactions between the contractor and dishonest city officials. It should be carefully and strictly defined in contracts and should in every case be the subject of a supplemental contract if its value is to exceed a stated sum, say \$250.00.

Supplemental contracts should be made on standard printed blank forms and should be filled in with the same care and executed with the same formality as the original contract to which they should refer. They should include a form of consent which should be executed by the bondsmen.

So much care and formality may be thought unnecessary by city officials in most cases, but should be strictly enforced. More honest misunderstandings and greater opportunity for dishonest practices occur in this matter of extra work, as ordinarily handled, than in any other element of contract work and it should be dealt with accordingly.

Commenting upon the fact that, in proportioning concrete materials the cement is measured loose, he suggests the following clause to cover this:

One barrel of Portland cement shall be held to be four cubic feet and one standard bag of cement (four bags to the barrel) as one cubic foot; and the quantity of sand and stone to be used shall be determined accordingly.

The proportions for pavement foundations and also those for sidewalk foundations he considered unnecessarily rich and recommended changing the former from a 1:3:6 mixture to a 1:3:7 and the sidewalk foundation from a 1:2½:5 to a 1:3:6. As stated above he also recommended reducing the thickness of the pavement foundation on residence streets from six to four inches; and he considered the 9 inches of sidewalk foundation as unnecessarily deep and recommended reducing this to 6 inches. He also recommended that the 7-inch concrete foundation and 2-inch surface course required at driveways across the sidewalks be reduced to 5 inches and 1½ inches respectively. These changes were recommended as reducing the cost

of the work, without, in his opinion, making it undesirably weak.

Concerning brick pavements his principal recommendations were that for 12 to 14 inches out from the curb the brick be laid parallel with the curb, whereas the present practice is to carry all courses at right angles with the street for the entire width from one curb to the other. The object of the proposed change is to reduce resistance to flow of water in gutters on flat grades. He also recommended the use of cement grout filler instead of bituminous filler; in spite of the confessed advantage of the latter that the street may be thrown open to travel as soon as the bituminous filler cools, which will be well within 24 hours; while if the grout filling be used the street must be closed from four to seven days until the cement sets hard enough to withstand the travel.

The specifications for asphalt he considered to be insufficiently exact. "Experience has shown beyond question that it is unwise for cities to admit asphalts the use of which is more or less experimental. Desirable as is free competition among contractors, it is secured at too great a cost when the result is inferior pavements. This is particularly true now when unreliability of long time guarantees of pavements by contractors is generally recognized." He recommended confining the asphalts admitted for use to three or four well-known varieties and practically preparing different specifications for each of these, recognizing their varying qualities and adapted to secure the best results. He refers to the danger that in obtaining the so-called artificial asphalts by distillation the oils may be raised to too high a temperature, resulting in "cracking," which greatly injures the asphalt for paving purposes. This matter of quality of asphalt he considers so important and so difficult to control under the ordinary contract system that he recommends "that cities shall themselves supply the contractors with the refined asphalt for asphalt pavements, in the same way that many cities and corporations supply their contractors with hydraulic cement, in order that its quality may be satisfactory and uniform. . . . Uniform material of high quality would be insured and contractors could then have no motive for using cheap and inferior asphalt. The contracts would then be for the construction only of the pavement, and as only a few different kinds of asphalts would probably be used the city could determine the kind to be placed on any given street and prepare the specifications explicitly to fit the work."

Concerning wood paving blocks Mr. Whinery apparently believes in the use of real long leaf yellow pine and not what is commercially offered under this name; and therefore recommended that it be called for under its botanical name, *Pinus palustris*, since a considerable amount of short leaf pine and lob-lolly pine are sold as long leaf yellow. He also stated that considerable amounts of Tupelo gum, a very inferior wood, is sold under the name of black gum. The specification that "the annual rings shall number not less than six to the inch measured radially from the center of the heart" will not, he states, exclude all wood other than long leaf yellow pine, as it is intended to do; since other species of pine often have more than six rings. But in mature true long leaf yellow pine the rings are seldom less than 12 to the inch, and he therefore recommended specifying not less than ten annual rings and the strict enforcement of this.

Concerning the oil used for treating wood blocks he severely criticized the specifications of the Association for Standardizing Paving Specifications, stating that these do not provide for a true creosote oil at all, and that "it is not claimed by its advocates that the oil called for by these specifications has this antiseptic property to any useful degree, but they do claim that its preservative property, due to the exclusion of water, is sufficient for paving blocks." We think Mr. Whinery is mistaken in this, and that the advocates of these specifications do claim that they provide for a considerable amount of creosote in the oil and that it does have antiseptic property. He also makes the claim, which has been frequently made by others and emphatically denied by the advocates of these specifi-

ications, that the oil called for by them is a monopoly and that free competition is thus prevented.

One practice in connection with asphalt pavement repair which he criticises seems to us to have much to commend it. He found that the contract for resurfacing asphalt pavement was let last June to the Barber Asphalt Paving Company for 76 cts. per square yard, which he says is below actual cost if the work be properly done. This he explains by the fact that the same contractor is also to repair, ordinarily at the same time, the pavement over plumbers' ditches and other cuts, the price for which is fixed by the city and is not subject to bidding. The price for this work is \$3.00 per square yard for openings less than 25 square yards and \$2.00 per square yard for those over 25 square yards, with \$10.00 as a minimum charge. When these are done in connection with the general resurfacing of the street there is a very large profit in them and a part of this profit is probably figured by the contractor as offsetting any loss in the general resurfacing contract. The repair of these pavement cuts is paid for by the parties for whom the cuts are made; and therefore, if his assumption is correct, the same parties pay for a portion of the resurfacing of the entire street outside of the cuts. It is this to which he seems to take exception, as not being equitable; but to us it seems a very admirable arrangement since it tends to confine the number of cuts to those actually necessary, and since the damage done to a pavement by a cut is not limited to the area of the cut itself but frequently extends to a considerable distance and where the cuts are numerous it seems quite probable that the life of the entire pavement may be reduced by them.

The city of Chicago taxes the owners of vehicles and applies the funds thus raised to keeping the pavements in repair. This principle Mr. Whinery considers a sound one and congratulates the city upon its successful introduction. He refers to some difficulties in carrying out the ordinance, among these being the inconspicuousness of the tags used and the lack of uniformity in their location on the vehicle, thus making it difficult for the police to determine whether or not a vehicle carries a license tag. There is also the complication in the detection of unlicensed vehicles offered by the fact that a considerable number are exempt from the tax and that a great many non-resident vehicles are to be found on the city streets. The matter of the plates or tags he is able to suggest solutions for; but he confesses that he has none to offer concerning the non-resident vehicles.

MADISON, WIS., WATER NOTES

In his report for the year 1910, Mr. John F. Icke, superintendent of the municipal water works, gives the new schedule which the Water Commissioners prepared last year, based upon the order of the Railway Rate Commission. This new schedule in some cases slightly increases the cost to consumers and in others decreases it. According to this, the charge is divided into two parts, one a service charge which is independent of the amount consumed, the other an output charge based upon the quantity consumed as measured by meters. For one consumer on a meter the service charges are: 5/8-inch meter, \$1.50; 3/4-inch meter, \$1.75; 1-inch meter, \$2; 1 1/4-inch meter, \$2.75; 2-inch meter, \$3.75; 3-inch meter, \$6; 4-inch meter \$10. For each additional consumer on the same meter there is an additional charge of \$1. Each dwelling, flat, suite, store tenant, etc., is regarded as one consumer. The output charge is 6 cents per 100 cubic feet, up to and including 75,000 cubic feet, and 5 cents for quantities in excess of 75,000 cubic feet. The service charges are payable semi-annually in advance. The report states that the output charges are also payable in advance, but this must be a mistake.

In addition there is a provision for flat rates, under which residences, stores, etc., with sewer connections, are charged \$3, and those without sewer connections \$1.50; barns, ware houses, etc., with sewer connections, paying \$3, and those without sewer connections, \$1. These rates are payable semi-

ually in advance. The decision of the rate commission included the payment by the city to the Water Department \$20,000 for fire protection and other services.

Attention is called to the considerable and serious consumption of water by a sewage lift which is operated by city water which raises the sewage from a small low-lying section of city. The water for operating this is taken from the city as through three 5/8-inch taps, which are wide open all time. Last winter Mr. Icke metered this water and the measurements obtained indicated a yearly consumption of about 5,300,000 cubic feet, which, at the lowest rate charged, would cost \$2,650. At the time of reporting he was preparing plans for an electrical pumping station to take the place of the water-operated lift, since this amount was a heavy drain on the supply system.

The increasing use of water for street sprinkling also had been seriously felt but it was believed that this would be greatly reduced this year, as Common Council had provided for oiling all macadam roads during the present season.

USE OF FIRE HYDRANTS

In the report for the year 1910 of A. J. Walden, Fire Marshal of Wichita, Kan., it is stated that "the frequent use of the hydrants by sprinkling wagons, cement workers and others have injured the stems until a great many of them cannot be used quickly in case of fire. Our plug wrenches cannot be used on many of them to turn water on, and each plugman is required to have a Stillson wrench in order to get water from them. We frequently find the caps on the hydrants corroded and rusted so that they cannot be removed by ordinary methods, which is a serious handicap and a menace to efficient service." The damage done in Wichita by improper use of fire hydrants appears to be greater than in most cities, but it is greater in degree only, and not in kind, than that which is always sure to result from permitting the use of fire hydrants by any except the fire department.

PAVEMENT CROWNS IN WASHINGTON

Method Used for Seventeen Years—Development of Formulas for Curbs at Same and at Different Elevations.

Report by T. J. Powell before the American Society of Civil Engineers, published in the Proceedings of that society for March, 1911.

The following method of treating crowns has been used by the Engineer Department of the District of Columbia since 1894, and has only recently been formulated.

This formula was suggested and deduced by Mr. Joseph W. Lee, assistant engineer of the District of Columbia, and takes account the width of the roadway and the longitudinal grade of the street. It is applicable for all widths of roadway from 10 feet to and including 50 feet, after which it is necessary to treat the section as a special one. The formula is:

$$C = \frac{W(100 - 4P)}{6300 + 50P^2}$$

in which C = the crown, in inches,

P = the longitudinal grade, expressed as a percentage,

W = the width of the roadway, in inches.

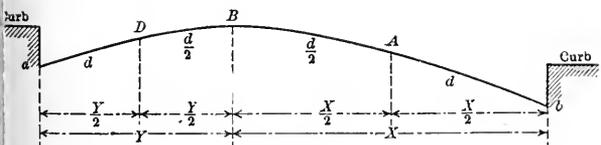

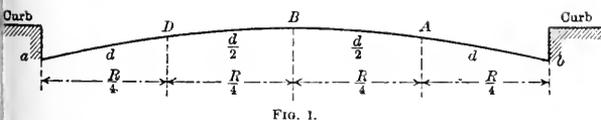

DIAGRAM OF ROADWAY CROWNS

When the curbs are level, the crown is distributed as shown by the following formula:

$$\frac{8C}{0.3R} = d$$

$$a \text{ or } b + \frac{C}{18} = \text{the elevation at } A \text{ or } D;$$

$$a \text{ or } b + \frac{C}{12} = \text{the elevation at } B;$$

d = the transverse grade, expressed as a percentage;

a or b = the elevation at the gutters, expressed in feet and hundredths.

As will be noticed in this formula, the percentages of grade from gutter to quarter and from quarter to crown in no case exceeds 4 per cent and 2 per cent, respectively, and the diagonal rate from quarter to the curb, along the hypotenuse of an isosceles triangle, the legs of which are equal to the distance from the quarter to the curb, will not materially exceed the longitudinal rate, thus keeping a team on the same rate of grade, whether they are going straight up hill or taking a diagonal course as is their desire if left to themselves.

This, as far as the writer knows, is the only formula in which this holds good.

Another point, which has been taken into consideration and is shown in the following formulas, is the location of the crown when there is a difference in the elevations of the curbs.

$$\frac{a-b}{1\frac{1}{2}d} + \frac{R}{2} = X$$

$$R - X = Y$$

$$b + \frac{X}{2}d = \text{the elevation at } A;$$

$$b + \frac{3X}{4}d = \text{the elevation at } B;$$

$$a + \frac{3Y}{4}d = \text{the elevation at } B;$$

$$a + \frac{Y}{2}d = \text{the elevation at } D;$$

X = the long side of the crown;

Y = the short side of the crown;

R = the width of the roadway, in feet and hundredths;

d = the transverse grade, expressed as a percentage.

This formula puts the crown and quarter points in such a position that the transverse grades from gutter to quarter and from quarter to crown will be the same as if the curbs were level, for the same longitudinal grade.

It is the practice in Washington, D. C., to put vitrified block gutters on streets on which the longitudinal grade is 1.5 per cent or less. This does not change the formula, as 0.1 feet is added to the curb side of the gutter for the rise of the same. The crown is then worked, using the distance between gutters as the width of roadway.

These formulas refer particularly to streets paved with sheet-asphalt, but for asphalt block, granite block, or other pavements having a more or less rough surface, and therefore giving a more secure foothold, it can be used equally well and give as good results by the addition of one inch to the amount of crown given by the above. This gives rates a little steeper from gutter to quarter and from quarter to crown, which is necessary, as these materials when paved on a gravel or sand base, as is usually the case, have a tendency to settle until all joints are entirely closed and water does not get between them.

These crowns give transverse grades sufficient to carry all water to the gutters as rapidly as necessary, besides reducing to a minimum the number of accidents caused by horses falling; and it produces a section which is pleasing to the eye.

CONSUMPTION OF WATER IN DRY SEASON

In Newton, Mass., during 1910 with precipitation 25 per cent less than the average and mean temperature, one of the highest on record, the per capita consumption of water for the year increased to 62.5 gallons as compared with 59.1 during 1909.

DENVER MUNICIPAL ASPHALT PLANT

Annual Report for the Year 1910—Repair Work Done—
Cement Gutters—Detail Cost of Materials
and Labor—Cost of Plant

By SAMUEL R. MURRAY, Asphalt Superintendent.

THE municipal asphalt plant, of Denver, Colorado, which is in charge of the commissioner of highways, was completed July 4, 1910, but as 30 days' notice was given the contractor making the city asphalt repairs, the plant did not commence operations until August 5, 1910.

From that date until the close of the season there was turned out by the plant and laid by the department 6,058 boxes of surface mixture, 1,580 boxes of binder and 2,208 boxes of asphalt and tar macadam, a total of 9,846 boxes of mixture. The total yardage laid was 31,928.3 square yards of asphalt surface, 11,901.32 square yards of binder, 1,868 square yards of asphalt macadam and 5,447 square yards of bituminous or coal tar macadam.

In addition to the asphalt and coal tar macadam there was laid on Speer Boulevard 1,443 square yards of Amiesite, the material for which was purchased already mixed from the Amiesite Co. at a cost of \$1.306 per square yard for material and labor for 2-inch wearing surface exclusive of base.

The asphalt macadam 2-inch wearing surface cost \$1.10 per square yard without base, which consists of 5 inches of smelter slag rolled and coated with bituminous cement. The tar macadam 2-inch wearing surface cost \$.685 per square yard, also exclusive of base, which was the same as the base for the asphalt macadam and Amiesite. All the work on Speer Boulevard was paid for by the Highway Department from its fund.

The resurfacing of Larimer street between Nineteenth and Twenty-fifth streets with 1-inch binder and 2-inch asphalt wearing surface was made necessary by the removal of the old cable slots and the laying of new steel, which changed the grade of the street; and as the original asphalt pavement had been laid 19 years it was economy to replace it entirely. Instead of the straight asphalt gutters such as had been used on the street, 5,120 lineal feet of cement gutters 2 feet wide were constructed. To the foundation was added 10,460 square yards of concrete which was laid to make up the difference in grades after new steel was in. This concrete ranged from 1 inch to 6 inches in thickness and was laid on top of the old 6-inch concrete base.

The work of laying the concrete and cement gutters on Larimer street, also the laying of the concrete around Pioneer Monument and the concrete for a great deal of the private work was performed by the Highway Department, but the entire cost was paid from the paving fund. The total cost of removing the old asphalt surface from Larimer street, constructing 5,120 lineal feet of cement gutters, bringing up 10,460 square yards of concrete to grade and laying this same yardage of 1-inch binder and 2-inch asphalt wearing surface was \$15,999.64, and the cost of the binder and surface alone was \$.913 per square yard.

The total amount of the money available for the paving fund by appropriation, credits, and including \$2,635.02 of the highway money used by this department, was \$128,655.96. Of this \$51,074.34 was used for the sandstone block repairs and the contractor repairing asphalt streets before the operation of city plant, leaving a balance of \$77,581.62 which was expended by this department.

The total cost of the asphalt plant, ground, building, steam roller and equipment was \$30,488.11, leaving \$47,093.51 which was expended on the asphalt work. Material on hand and paid for to January 1, 1911, amounted to \$4,427.00, for which amount our fund should be credited.

The cost of resurfacing Larimer street, Nineteenth to Twenty-fifth streets, was \$15,999.64, leaving \$26,666.87 which was expended for the city's own repairing and the private work performed for plumbers, contractors and public service corporations which made cuts in the asphalt pavements.

The money received or due the city for private work done by the municipal plant (4,078 square yards), including credit for empty cement sacks returned, amounted to \$10,269.10.

The cost of laying a standard asphalt pavement at Pioneer Monument (975 square yards), consisting of the excavating, laying 6 inches of concrete base, 1-inch binder and 2-inch asphalt wearing surface, and laying 200 square yards of standard pavement in Carlton Hotel alley, amounted to \$1,938.75 for this 1,175 square yards. Deducting this from the total yardage of city work leaves 16,215 square yards of actual city repairs at a cost of \$14,459.02 or \$.891 per square yard. This includes all necessary concrete or binder where the holes had worn too deep into the pavement to be filled with surface mixture without wasting good material. All work was done on the 8-hour basis, as was other city work, and the very best of material and workmanship was used throughout.

As limestone filler was impossible to secure, Portland cement was used instead. We are now installing a mill for grinding our own limestone dust, which will lessen the cost of filler about 4 cents per square yard, so that the dust mill will pay for its installation in one season.

The greater part of the city's repairs and the repairs on the thinner pavements such as Colfax avenue and on Fifteenth street was done while the contractor was furnishing the material. This work will be done by the city plant this season which should also decrease the cost per square yard.

HOUSE NUMBERING BY LATITUDE AND LONGITUDE

A CORRESPONDENT from Paris, France, to a Chicago daily paper states that a system of house numbering has been recommended for that and other European cities, by which the entire city would be divided into small squares ten meters on a side and the location of all buildings in the city be designated by the square it occupies, in addition to the street numbers. This amounts to practically a system of co-ordinates, each square being designated by a certain number of units of distance north or south and east or west of co-ordinate axes. The advantage claimed by the advocate of this is that the position of any building sought relative to any other locality could easily be recognized and the building found, since every lamp post or street corner would carry the co-ordinate numbers of its particular locality, north and south ordinates being in red and east and west in blue. In addition, there would be an arrow pointing approximately north.

It seems to us that this system, while it has some advantages is more cumbersome and in general less desirable than the method adopted by some cities in this country of numbering the houses according to a co-ordinate system, the chief advantage of the proposed system being that it is unnecessary to know the location of the street on which the desired building is located, as in the system of co-ordinate numbering. On the other hand the proposed system requires a double address, one giving the co-ordinates and the other the street and house number. The location of streets is a simple matter where all are given numbers, and those in one direction called avenues, as in New York; but this system can be adopted completely only where the street system is almost wholly on the rectangular or grid-iron plan. Where this is not the case the arrow to designate north would doubtless be of assistance, to be placed on each corner street sign on streets running approximately north and south.

Pollution Through Water Mains

SOME time ago there appeared in one of the New York daily papers a letter from an interested citizen which undoubtedly must have amused most engineers who read it. This called attention to the great danger of polluting the city's water supply which was occasioned by permitting dirty street water to enter the valve boxes; the writer's supposition, of course, being that these valve boxes led into the mains, and that the street water flowed into the mains through them. It seemed difficult to understand how any one with the most elementary knowledge of technical matters could imagine such a thing. However, a recent report of the Virginia State Board of Health contains a report by a civil engineer and a physician that just this thing had occurred at Lexington, in that State, and when the circumstances are set forth it does not seem so

impossible. It seems that, owing to the drought last fall, an effort was made to retain water in the reservoir for fire protection by closing certain valves on the main distributing pipes every evening and opening them in the morning. The continued use of water from the mains while the valves at their upper ends were closed tended to produce a vacuum in this above the points of greatest consumption, and the hypothesis is advanced that this vacuum caused the entrance of ground water into the mains through leaky joints, which ground water was presumably polluted with sewage from sewers in the vicinity which were known to have been leaking. The circumstances were such that the only other plausible reason which suggested itself for the epidemic which occurred in November was that some of this same sewage from the leaky sewer had entered the main during the making of a house connection. One argument in favor of the former supposition is that the indrawing of the ground water by the vacuum would probably have taken place daily, whereas the entrance through the tap for the house connection could have occurred but once and all the water containing it would, under the circumstances, probably have been drawn off within a day or two.

The danger of drawing in polluted water through leaks in water-works intakes, where these pass through bodies of impure water, is thoroughly appreciated; but a new danger is suggested by this report from Lexington, and it does not necessarily require the existence of a leaking sewer, since the ground under most cities and the water in it are more or less grossly polluted. The danger of such a happening should, therefore, be borne in mind whenever any manipulation of water mains is contemplated which might result in a negative pressure. Theoretically, of course, the joints should be so tight that the indrawing of water in such a way would be impossible, but this cannot be certified to in many cities. The simplest preventive would be to leave a few fire hydrants open as long as the hydraulic gradient is below their nozzles.

Prepare Now for Water Shortage

THE Water Commissioner of New York City within the past week, through the several daily papers, requested that the consumers be as careful as possible not to waste water, as the amount of water at present in the reservoirs was the lowest in several years. "The department is doing everything it can," the commissioner is reported as saying, "to avert the famine, and we have already stopped the use of hose in the city. The per-capita daily consumption of water in the city is 111 gallons. This is altogether too large, and means that a great deal of water is being wasted."

The same commissioner last October removed a deputy commissioner of water supply who, it was generally understood, had been appointed at the request of citizen organizations expressly to discover and stop the leakage, waste and illegal use of water in New York and who, in about six months, by inspection, the use of pitometers and the testing of meters in the boroughs of Brooklyn and Richmond had increased the meter registration about 300,000,000 gallons a year and had discovered and stopped leaks which had been flowing at the rate of about 1,350,000,000 gallons a year. This work was abruptly terminated with the dismissal of the deputy commissioner. It is interesting to recall these facts while reading the commissioner's plea.

The last year or two has seen cities, both large and small, in all sections of the country from Maine to Texas, confronted by a shortage of water supply. In many of these cases it is not even a question of spending the necessary funds—an increased supply seems to be actually unobtainable. In view of this it seems necessary that thorough, intelligent and honest effort be made to adopt some method or methods which shall restrict the use of water to that which is necessary, and discover and remedy most of the loss through leaky mains. What methods should be adopted we do not pretend to say, and they would possibly differ in different cities, but several such are available and it would seem to be the part of wisdom and true economy for a great many of our cities to initiate or increase the use of them.

BUDGET EXHIBIT IN HOBOKEN

A MUNICIPAL budget exhibit, gotten up by the Board of Trade, assisted by the Robert L. Stevens Fund for Municipal Research and the Board of Education, is being held in Hoboken, N. J. The exhibition occupies two large rooms, one containing the Board of Education exhibit, consisting for the most part of samples of work done in the schools, and the other containing the exhibits prepared mostly by the office force of the Stevens fund. This includes the same classes of articles shown in the exhibit of the city of New York, held last winter, namely, placards containing data or calling attention to interesting facts, graphic illustrations, photographs, plans, models and physical objects. On the whole, the exhibit is a very commendable one, and has attracted crowds of visitors. A series of talks on topics of municipal interest is also a drawing feature of the show.

The data supplied by the financial department is, of course, the most comprehensive. This tells the same story as similar statements of almost any other city, namely, constantly increasing taxation. Other parts of the exhibit indicate that the benefits also have been constantly increasing. In Hoboken's case however, it seems that State and county taxes have increased even faster than city taxes. Other tabular statements give the mileage of pavements and sewers, and figures about the cost and strength of the fire, police and other departments. The accompanying illustration is a reproduction of one of the most interesting placards. The proposition presented is purely a local one, but the condition prevails in many other cities. The laws regarding city government and administration are recorded in so many different books that only experts can find them, and perhaps not even they with certainty.

**DO YOU WANT TO LOOK UP
THE LAW ABOUT OUR CITY -
GOVERNMENT AND ADMINISTRATION?**

**YOU MUST READ THESE BOOKS THROUGH
BEFORE YOU FIND THE LAW, AND THEN YOU
MUST STILL LOOK FURTHER TO INTERPRET
IT.**

**WOULDN'T IT BE SAFER AND CHEAPER TO HAVE
IT IN ONE BOOK?**

The placard features four small images of books: '1911 SESSION LAWS', 'ORDINANCE BOOKS', 'GENERAL STATUTES OF N. J. 1898', and another book with a dark cover.

ONE PLACARD IN THE EXHIBIT

Among the models are three which convey information of considerable practical value at a glance. One shows the strength of the fire department. On a map of the city are miniature houses, properly placed, and small models of firemen. The observer who looks closer will see written on the map on each side of the house a statement of just what apparatus it contains. A similar map gives the distribution and housing of the police force throughout the city. Still another gives the distribution of the street cleaning force, and shows plainly how much more it costs to clean a business than a suburban street.

Photographs show nearly every branch of municipal activity. Those showing park scenes are perhaps the most attractive to the general public.

Among the physical objects shown are devices actually used by the various city departments, such as the rattan broom of a

street sweeping machine, an iron rubbish can and a set of tools used by the street cleaning patrol man. A water main tapping machine attracts considerable attention. Along with this are samples of iron cut from water mains forty years old, showing the metal seemingly in as good condition as when new, and free from tuberculation. This exhibit has a cheering effect showing citizens that some things have been done fairly well if only by a private water company. The fire department shows a pretty complete set of small tools, such as axes, door opening hose nozzles, rubber hose and the like. The Playground Commission has one of the most complete exhibits in the whole collection. It includes photographs of grounds and the physical objects used, as well as models. The prominence of the playground feature may be an inheritance, for Hoboken citizens are largely of German descent, and Germany leads the world in interest in children and the invention of toys and apparatus for their amusement and development. Judging from the exhibit, Hoboken must be far ahead of most cities in the equipment of its playgrounds.

Bureaus for municipal research are naturally critical, and show gotten up under such auspices would not be complete without a "table of lemons." This, with an appropriate placard portraying the citrus fruit, contains a series of small articles purchased by contract or otherwise by various city departments at prices considerably above those ordinarily charged at retail. These are mostly stationery articles, such as erasers, etc.

The exhibit, of course, has an object. The 1911 budget is to be voted on June 11. The sum of \$675,000 has been asked. The Board of Trade, which is responsible for the exhibit, does not assume to say whether the sum is too much or too little; but circular which it distributes states that it should be large enough to meet all obvious needs. Whether it should be greater than last year depends upon whether it guarantees greater benefits to the community, for an increased budget should mean increased returns. What the Board of Trade has done is to collect such information as it could in regard to city affairs and present it in a popular way, all for the purpose of making the people think.

GREENWOOD WATER AND LIGHT PLANT

In the report for 1910 of the municipal water and electric light plant of Greenwood, S. C., Superintendent A. J. Sproule shows the condition of the plant to be apparently quite prosperous. Water is obtained from wells and pumped into a reservoir and a standpipe, steam power being used. Current for the lighting plant is purchased from the Savannah River Power Company. The department furnishes to the city without charge 18 incandescent lamps, 87 6.6 ampere arc lamps, 6 fire hydrants and water for flushing sewers, sprinkling street for public fountains and watering places. The water rate is 20 cents per 1,000 gallons up to 10,000 per month and 1 cent for all over this, while the charge for electric current is 10 cents per kilowatt up to 100 per month and 8 cents for all over that. The accounts of the water and light plant are not kept separately. The total receipts during the year were \$28,612, of which \$6,539 was spent in extensions, \$1,118 remained as a balance and \$3,500 was used for redeeming bond.

Although the city is not regularly charged with the service rendered, a book account has been kept in which the fire hydrants are charged at \$25 each, the arc lights at \$60 each and incandescent lamps at \$25 each. Water for flushing sewers and streets, for faucets and fountains and for street paving construction is charged at \$900 for the year 1910. Figuring it this way and deducting the interest on the bonds, which is paid by the city, shows a balance to the credit of the department of \$47,436. The original bond issue was \$40,000 and later bond issues have brought the total up to \$57,358. Since 1900 the department has made extensions from its earnings costing from \$1,500 to \$6,538 each year. These extensions from earnings would have sufficed to pay each year into depreciation account nearly 7 per cent on the first cost, or about 6 per cent on the first cost plus extensions.

NEWS OF THE MUNICIPALITIES

urrent Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

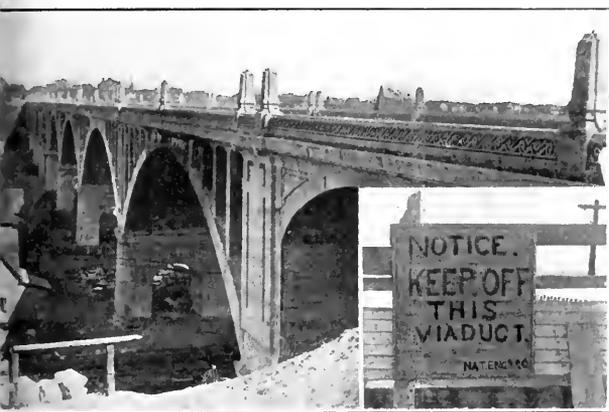

ROADS AND PAVEMENTS

Merchants Improve Streets

Hastings, Pa.—At a recent meeting Council accepted the proposition of the business men to improve the thoroughfares of the borough. A King road drag was used most effectively on the streets, and after a few holes and ruts were filled the thoroughfares will be in good condition again. No permanent improvements are contemplated, as the question of a sewer system is still before the citizens.

Viaduct Finished but Unused

Milwaukee, Wis.—The Grand avenue viaduct which was practically completed last October at a cost of \$500,000 is untricked by the contractor, the National Engineering Company and is unused. The builders claim that the work has been finished and accepted by the authorized officials. The county board of highways and bridges say that it is not

Courtesy Milwaukee Sentinel.

VIADUCT UNUSED ON ACCOUNT OF LITIGATION

Completed according to contract and have advised the contractor not to permit its use. The condition of things shown in the illustration is the result. The trouble arose from a change in the specifications from the sectional to the monolithic form of construction. Litigation and dissensions have been almost constant since the starting of the viaduct by the Newton Engineering Company in 1907, when \$200,000 worth of work was done, declared defective and the contract reawarded to the National Engineering Company.

Oppose Street Improvements

Cincinnati, O.—Protests against the proposed improvement of Richmond street, from Freeman to McLean avenues, have been made to the Council Committee on Streets and Parks by manufacturers whose plants are located along the street. They claimed that the improvement was not necessary and that the asphalt street would not be as good a street for the heavy traffic as the present boulder street. John Gigos, School Board member, spoke for asphalt. The committee took the protest under advisement and will instruct the street.

Boulevard Plans Are Now in Shape

Salt Lake, Utah.—Revival of the Saltair boulevard project, on a scale and with a backing that practically assures the early culmination of this long-talked-of enterprise, was brought about at a recent meeting of local autoists. Joseph Nelson, president of the Saltair Railroad, appeared before the meeting and pledged the necessary money required for the building of the road, above \$25,000, which the autoists themselves must raise. The proposed route is directly west of Saltair, on to Garfield and returning to the city through the southern end of the valley. It is intended to complete the road within six weeks, in time for the coming season at the lake.

SEWERAGE AND SANITATION

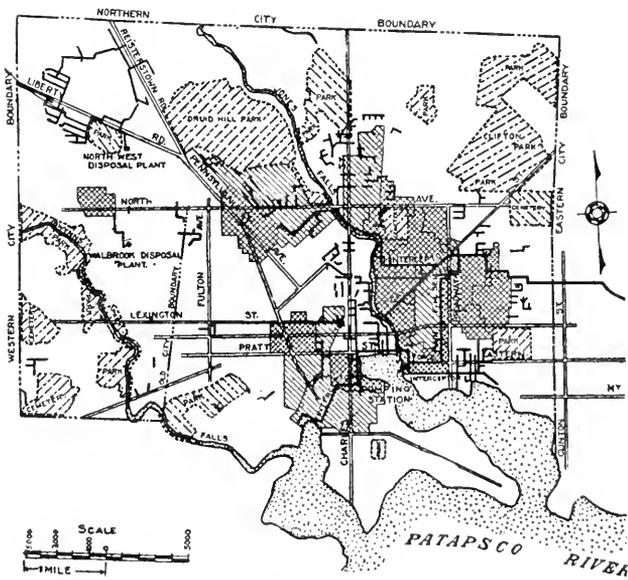

Starts Anti-Fly Crusade

Portland, Ore.—Health officers are going to make Portland a flyless town this summer. They promise these disease breeders will be rare and that the fly pest of former summers will be almost wholly abated. The system of flushing the downtown pavements every night, instead of sweeping them as formerly, washes the larva of the flies into the sewers, thus doing away with one of the most favorable breeding places. Every road leading into Portland will be oiled this summer to lay the dust and this treatment completely kills flies and renders their eggs harmless. The oil applied is crude petroleum which contains a small quantity of carbolic acid and is sure death to flies and mosquitoes.

Present Condition of Baltimore Sewerage Construction

Baltimore, Md.—The accompanying map shows the area in which lateral sewers will be built from the proceeds of the first sewer loan. The heavily shaded sections are those in which the laterals have already been laid or contracted for. The lightly shaded sections are those for which no contracts have been made, but to cover which there are still sufficient funds on hand from the last loan.

In addition to this work, principal parts of the system have been built, at a cost of \$3,700,000, which are designed for a population of 1,000,000. These are:

MAP SHOWING PRESENT STATE OF BALTIMORE SEWERAGE IMPROVEMENT

- Outfall sewer, from Chase and Durham streets to disposal plant, 5.3 miles in length.
- High-level interceptor, from Chase and Durham streets, to Jones' Falls.
- Low-level interceptors, from Warner and Alluvion streets to Boston and Hudson streets.
- Force main and force main sewer, from pumping station to Chase and Durham streets.
- At the disposal plant a sufficient number of units to pump the sewage of a population of 275,000, comprising hydrolytic and sludge digesting tanks, sprinkling filters, settling basins, hydro-electric plant and discharge conduits.
- Sewage pumping station building, at Eastern and East Falls avenues, of sufficient size to contain pumps to pump sewage from the lower lying sections, which comprise one-third of the city.
- Three sewage pumps of 27,500,000 gallons daily capacity, with the necessary boilers and other equipment.

These expensive items having already been taken care of, a much larger proportion of the next loan can be devoted to laterals. While less than half the city has as yet been laid with them, therefore all the remainder can be provided for from this loan.

Ohio Village Has Modern Disposal Plant

Marble Cliff, Ohio.—Marble Cliff, a village of 300 inhabitants, now has a complete modern sewage disposal plant besides a system of sewers 12,000 feet in length. The disposal plant, shown in the illustration, comprises a contact filter system with sedimentation tanks and secondary fine cinder filters. The sedimentation tanks are roughly 20 feet square and 6½ feet deep. They are divided into three chambers of equal size and so arranged as to allow the sewage to flow through all tanks in series or parallel, to allow the cutting

Photo. by C. L. Dowerman, Staff Photographer Columbus Dispatch.

A VILLAGE SEWAGE DISPOSAL PLANT

out of any of the chambers for cleaning. The contact filters are 87 x 29½ feet in area and 5 feet deep. They are divided into three filter areas, and are provided with airlock apparatus which automatically directs the flow of sewage onto each of the three beds in rotation, allowing each bed to fill to the depth of 3 feet and then directing the flow into the next filter, while at the same time starting a timing device which automatically controls the outlet. The timing device is so arranged that the sewage can be held for from fifteen minutes to four hours on the filter, and then thrown onto the secondary filters. The secondary filters are of the same dimensions as the contact filters, but are only 3 feet instead of 5 feet deep. They also are divided into three beds and equipped with a system of gates to direct the flow into any of the beds.

Sanitation Ordinance Is Passed by Board

Dallas, Tex.—An ordinance has been passed by the Board of Municipal Commissioners providing for the sanitary condition of bakeries, canneries and other places where foods are prepared or offered for sale. The ordinance will become effective in thirty days. The act requires that such places shall be "properly lighted, drained, plumbed and ventilated and conducted with strict regard to the influence of such condition upon the health of the operatives, employees, clerks or other persons therein employed, and the purity and wholesomeness of the goods therein produced." Cleanliness as to all walls, ceilings and floors, paint for all exposed surfaces, care for the cleanness of the implements, machinery, utensils and boxes and for all paper used, care for the cleanness and health of persons employed are required. Screening is obligatory with self-closing screens. Sleeping will not be permitted in any workroom nor will any person with a contagious or infectious disease be employed. Members of the Board of Health or their agents will be permitted at any and all times to make inspection of all such premises. Sweeping the floors of restaurants while a patron is present is forbidden. No garbage is to be brought through the serving room or any eating place while any patron is present. Fruits, vegetables or other foods are not to be exposed on the sidewalks or outside of any screened place. All such fruits are to be shown in cases that are to be at least two feet above the sidewalks. All must be protected from "flies, dust, dirt and all other foreign or injurious contamination by suitable coverings of glass, wood or metal."

WATER SUPPLY

Will Cut Water Rates

Spokane, Wash.—Spokane's Water Department shows actual 100 per cent profit on maintenance and operation and it is planned by the new administration to cut the rate if the debts, now eating up half the gross receipts, can be cared for.

City and County Drive a Bargain

Tacoma, Wash.—An agreement has been reached between Mayor W. W. Seymour and the municipal commission and the board of county commissioners whereby in exchange for a pipe line franchise to the Green River water plant the city will give the county water for its institution in Tacoma at half the price paid by private individuals.

May Go to Ozarks for Water

Oklahoma City, Okla.—It begins to look as though Oklahoma City would have to go to the Ozark Mountains, Missouri for its water supply within a few years. At a rate, some of the most accomplished engineers who have studied the question recently are convinced that such a course is the only possible solution to the matter of supply coupled with the purity of the water. There is now being tentatively considered a proposition to vote a \$5,000,000 bond issue for the purpose of extending the water system so as to get water by a gravity flow from some point in the Ozarks.

Commissioners Inspect Pipe Line Extension

East Hartford, Conn.—The Commissioners of the East Hartford fire district, Engineer C. Henry Olmsted a Superintendent of Water Works John H. Walsh recently inspected the new pipe line extension. The party took trolley as far as Brewer street and then took carriages to Hillstown. The pipe line is nearing completion, and it was said that a connection will be made inside of a week. The contractors have worked on the line during the winter when the weather would permit. The cost is about \$60,000.

Councilmen Go Over Aqueduct

Los Angeles, Cal.—The members of the City Council are making a tour of inspection of the Owens River aqueduct system. The trip is made in a Pullman car and automobiles. At night the Pullman is used for sleeping purposes and by day the automobiles are utilized for sightseeing. General Adna R. Chaffe, the head of the Aqueduct Commission, is in charge of the party. William Mulholland and J. B. Lippencott, the chief engineer and assistant chief engineer, respectively, will explain the work to the Councilmen and will tell them of the advantages to be gained by starting the work of providing a lighting and power system at once.

City Will Have Fifteen Wells Connected Soon

Lansing, Mich.—Frank J. Nichols, who has charge of the construction work for the Water and Electric Light Board states that next week he will have another well of water added to the nine at the Pennsylvania avenue subpump station. Then there will be five more to be connected which will make the total 15. At present the wells in use are furnishing little more than that demanded by the city users. When the weather has really settled, and the thermometer begins to climb, there will be an increased demand for water, and this can be met by the addition of these unconnected wells.

Water Company Told Its Franchise Ends

Des Moines, Ia.—Municipal ownership of the Des Moines Water Company by condemnation proceedings may be resorted to if voters express a desire to hold a special election to determine the question. Mayor Hanna, on a resolution passed by the Commissioners, notified the company that the franchise under which it operates expired on May 1st. The grant was given the company by the city in 1871. "We are not opposed to municipal ownership of the water company," said Manager Charles Denman, of the Water Company. "If the city and company can agree on a price, the city may make over the works. Under the law governing municipal ownership the city is given the power to own and operate water plants."

STREET LIGHTING AND POWER

Preparing for Valuation of Rail-Light Physical Property

Colo., O.—According to plans outlined by Mayor Whitlock and City Engineer Tonson, the latter will confer next week with Rail-Light representatives to agree upon the method they will follow in making the valuation of the Rail-Light physical property. It is expected that Tonson will work as far as possible jointly with the company's engineer. Points upon which they do not agree will be referred to Mayor Whitlock and President Lang as negotiators.

Ornamental Light System Will Be Installed

Hastings, Neb.—The first step for an ornamental lighting system for the business section of the city has been taken by the Council in the granting of a petition for ornamental lights in Lincoln avenue, between First and Fourth streets. The property owners in this section have agreed to purchase the posts for the lights and the city will supply the current and maintain the lamps. A design for an ornamental standard will be accepted by the Council to be followed in this district and others that may wish to adopt the system on the same basis. Each post will support either three or four incandescent lamps. They will be placed at each corner on intersections and on both sides of the street at the middle of each block.

New Boulevard Lights Put in Service

Altoona, Pa.—With at least 25,000 lined up on the sidewalks, the tread of marchers, the waving of banners and the sound of martial music, the new boulevard lighting system on Eighth avenue between Eighth and Thirteenth streets was formally placed in service last week. It was a grand holiday and the interest and enthusiasm manifested in the triumph scored by the Second Ward Civic Association were bounded. The new boulevard lights are distinctly different from those on the West Side. There are three lamps instead of five, and the poles are enameled iron instead of brass. The poles are considerably higher and the arm is wider. They are covered with a profusion of fancy iron work and present an attractive appearance.

Light and Water Report for Year

Tacoma, Wash.—The annual report of the Light and Water Departments of the city for 1910 has been filed with the Municipal Commission by Nicholas Lawson, Commissioner of Light and Water. The report shows that during the year ending December 31 the Light Department netted the city \$72,678.11 above expenditures, while the net profits of the Water Department were \$28,927.81. The operating revenues of the Light Department for the year were \$499,007, while the disbursements aggregated \$393,493.41. The difference under normal conditions might be termed surplus earnings from operation, according to the report. On new work the department expended, however, \$122,838.55, which, added to maintenance and operation cost, brings the total expenditures up to \$426,331.96. The surplus is thus \$72,678.11. The operating revenue of the Water Department amounted to \$381,009.40, while the disbursements were \$263,993.05. The \$117,016.35 difference represents the surplus earnings from operations. On new work there was expended \$88,088.54, which makes the total expenditures \$353,081.59. The net surplus is \$28,927.81. During the year the city pumped 609,850,000 gallons of water. In addition there were 128,680,000 gallons repumped, the total pumpage being 738,530,000 gallons. The total cost per 1,000,000 gallons, figured on total maintenance plus interest on bonds, was \$6.03. The city at the end of the year had 220.8 miles of water mains in use, the size ranging from 2 inches to 24 inches. Twenty-nine miles of mains were laid during 1910. The total number of services at the end of the year was 5,146. Of this number 1,810 were on vacant property, where they were placed when streets were paved. New services installed totaled 1,017. Water meters in use at the end of the year were 1,254, 151 new ones being installed in 1910. Water is furnished to 1,045 hydrants, six drinking fountains and 24 watering troughs. During the year 1,045 new hydrants were installed in various parts of the city.

FIRE AND POLICE

Ordinance Provides for Police Matron

Hutchinson, Kan.—An ordinance has been passed by the Board of Commissioners creating the office of Police Matron.

Auto Chemical Gives Satisfaction

Stratford, Conn.—A new auto chemical has been received, accepted and placed in commission. Stratford is fortunate in having the kind of a chemical that this new machine is, for not only has it two chemical tanks but it carries ladders and 1,000 feet of hose so that when the auto gets to the fire everything that is needed in the majority of those fires that occur in town is right there.

Drill Tower for Fire Department Is Completed

Rochester, N. Y.—Announcement has been made by Commissioner of Public Safety C. S. Owen that the drill tower in the rear of the house occupied by Truck 5 and Engine 13, on Genesee street, has been completed and that the instruction of the members of the Fire Department in pompiere ladder work, raising of ladders, life net work and wall scaling will be commenced next week. Captain Titus Watchhouse, of Truck 5, will be the instructor.

Police Patrol Auto Here

Poughkeepsie, N. Y.—The much looked for and talked about police automobile has at last arrived and has been placed in commission. The interior may be used as a patrol auto or it can be changed into an ambulance by the dropping of the seats and the use of a stretcher, which is always ready. Besides the auto horn, a large gong is attached to the machine.

Will Study Fire Engines

Duluth, Minn.—The Board of Fire Commissioners at a recent meeting decided to recommend to the City Council that T. E. Phillips, Superintendent of Machinery of the Fire Department, be sent to Elmira, N. Y., to visit the plant of the American-La France Engine Company. In this manner he would thoroughly post himself upon the most modern fire department machinery and greatly improve his knowledge of the apparatus which is in use here. The matter will be left to the Council, with the understanding that the Board of Fire Underwriters is willing to pay half the expense of the trip, which, it is estimated, would cost \$100.

Automatic Hose Wagons Arrive

Portland, Ore.—The two automobile chemical and hose wagons ordered by the City Executive Board from A. G. Long for the Fire Department have arrived in this city and are on exhibition at the store at Sixteenth and Marshall streets. An instructing engineer from the factory in Ohio, where the vehicles were built, is on his way to Portland, and when he arrives the two pieces of apparatus will be thoroughly tested. This engineer will teach the men assigned to drive the machines how to handle them before he leaves the city. This is the first automobile fire apparatus purchased in this city and is attracting much attention.

Will Change Law to Provide for Policewomen

Spokane, Wash.—A new obstacle has arisen in the park board's program for placing policewomen in parks of the city. The recent civil service requirements promulgated by the city commissioner are so stringent as to physical requirements that it is believed few women would be able to pass the examinations. "It undoubtedly will be necessary to draw up an entirely new ordinance in this connection," said Attorney W. J. C. Wakefield, chairman of the board committee having the matter in charge. "I have not gone into the matter thoroughly, but that is my belief, off-hand." So far as their sex is concerned, the lawyer says, there need be no legislation. As yet, however, there is no provision for policing the parks and it is likely the same ordinance authorizing the patrolling of city parks will stipulate different physical requirements from those expected to patrol downtown streets.

Fire Department Gets Apparatus

Manchester, N. H.—Orders for a two-horse truck for engine 7 of Somerville street, and for an automatic hoist for Aerial Truck 1 of the Central Fire Station, were passed at a recent meeting of the Aldermen.

Tests Deluge Set and Purchases It

Albany, N. Y.—A test of a four-way Eastman deluge set was recently made in Market Square in the presence of Commissioner of Public Safety Conine and Fire Chief Bridgeford. Four lines were run from three steamers to the deluge set. A 2-inch stream was thrown to a height

Courtesy Knickerbocker Press.

TESTING EASTMAN DELUGE SET, ALBANY, N. Y.

of 250 feet. With a 1½-inch nozzle the stream went still higher, but did not impress Chief Bridgeford as favorably as the larger stream. It is believed that if the department had had this set at the time of the capitol fire the results might have been different.

Police Receive Correspondence Course of Instruction

Louisville, Ky.—Through articles published in the Police Bulletin, the official organ of the Louisville Police Department, the members of the force are receiving a "correspondence course" in policing. Col. H. Watson Lindsey is the instructor and schoolmaster. Chief Lindsey recently adopted this plan of giving the officers a daily lesson in the duties of a policeman. Not only are the members given instruction on many important subjects in connection with the work, but they are given rules and regulations concerning their personal conduct.

Tapper System Being Installed

Portsmouth, Va.—The tapper auxiliary system for the fire alarm has been received here and installed by Superintendent Smith, of the fire alarm system. The auxiliary system will enable the firemen, by its operation, to instantaneously inform all of the other engine companies of their departure from headquarters on "still alarms," a tapper system of indication sounding in all of the houses when the firemen are called out on other than alarms over the fire telegraph system. When the apparatus returns to any one of the houses from the "silent" calls, it will be possible to immediately inform the other companies that the apparatus is back and ready again to cover its territory. Hitherto it has been necessary for the firemen to inform those in other stations of their activity on "still" alarms by use of the telephone.

Citizens Work for New Charter

Lockport, N. Y.—In support of the new charter for Lockport a big delegation went to Albany to be present at the hearing before the Cities Committee of the Legislature on the progressive charter bill. The supporters of the charter will be backed by petitions with over 2,500 signatures of electors of the city.

Bonding System May Be Changed

Youngstown, O.—Guarantee bonds were discussed at length by council at a recent meeting, and suggestions for the establishment of a new system were brought out. A number of contractors have complained that they are unable to get bonds from some of the bonding companies. This was brought up by Councilman Jerry Sullivan several weeks ago. There has never been a case in the city where a bonding company had to make good on any job they went sure for. Last year \$10,000 was paid out by local contractors to these companies, and an effort will be made to retain this money in the city. Councilman William Sampson suggests that one-half of 1 per cent., the amount contractors pay for their bonds, be retained by the city when a contract is made, that this sum be put in a bank and in case the street needs repairing it be paid out of this fund. The money thereby kept in the city instead of being paid out to foreign companies. A plan similar to this is in force in Cleveland. City Solicitor David Jenkins has a plan whereby 3 per cent. of the amount of the contract be retained by the city. The amount of the guarantee is increased and the city will have a large fund to call upon. The money will draw interest and at the expiration of the guarantee the money is refunded to the contractor with or without interest, as is decided upon. Another feature in connection with this, as advanced by Mr. Jenkins, is to have all repairing on a street made under the supervision of the contractor who originally did the work.

STREET CLEANING AND REFUSE DISPOSAL

Test New Method of Laying Dust

Newburgh, N. Y.—Grand street between Broadway and Ann street looked like a winter's day recently, notwithstanding the fact that the thermometer was performing unbecomingly stunts and the heat was broiling. The reason for the appearance of this particular portion of the street lies in the fact that Waldo E. Austin and the representative of the Solvay Process Company of Syracuse have been demonstrating the merits of the dust preventer manufactured and sold, by the Solvay Company. The material used is granulated calcium chloride, and it is practically a new factor in dust laying.

Street Washer Is Tested Here

Trenton, N. J.—The Charles Hvas street washer was tried by the city last week and proved all that was claimed for it. When the washer has passed over a pavement it can scarcely scrape up a speck of foreign substance. The trials were on South Stockton street, Front street, Broadway and West State streets, and everywhere the experiment was lighted the many members of the Chamber of Commerce who were invited by Chairman Charles H. Reichert and Louis P. Nitz of the councilmanic street committee to witness the performance. All the committeemen and Street Commissioner Burk were likewise well pleased.

Board of Health Urges Installing Garbage Crematory

Atlanta, Ga.—In the hope of getting something done toward the city's long delayed crematory, the Board of Health at a recent meeting named a special committee of three to confer with the Bond Commission with reference to a site and to otherwise push the matter. The crematory is one of the most important things the present administration has to deal with, and yet it has been delayed more than most anything else connected with the city government. Not only has nothing been done this year, but no progress was made in the closing months of last year. The bond issue provides \$50,000 for the crematory. But this sum is not a third the amount needed. The first thing to find a site. Two have already been selected, in a tentative way, but abandoned because of the howls of protest that arose when their selection was made public.

RAPID TRANSIT

Would Stop Custom of Blocking Car Doorways

Indianapolis, Ind.—An ordinance forbidding persons to stand in the doorways of street cars is being prepared by Councilman Charles B. Stilz, who believes the practice of blocking street car doorways is an inconvenience to other passengers.

Trolley Company Gets Franchise

Carlisle, Pa.—The local trolley company at a special session of Council got the much-desired franchise for a line under the Orange street subway, but it is limited to 10 cars, and the only reason other restrictions were not put on it is that it is believed the borough authorities do not possess the power.

Anticipate Much Benefit from Electric Road

Caldwell, Ida.—W. E. Pierce, president of the Boise In-Corporated Urban, held a conference with members of the Caldwell Commercial Club relative to the proposed extension of the company's line from this city through the Deer Flat country and ending with a terminal at Roswell. The matter of extending the company's line has been hanging fire for the last two months, but the conference was fraught with indications that work would be commenced shortly and that the rich territory through which the project is planned to pass would soon be placed in closer relations with Caldwell.

New Traffic Regulations

Elizabeth, N. J.—Elizabeth is to have drafted an ordinance regulating street traffic, and if the ideas of Mayor Van and City Attorney Connolly are inserted in the ordinance the regulations will be such that the lives of pedestrians on Broad street at the East Grand and West Grand street crossings and in the vicinity of the arch will be safe. The ordinance has been adopted by City Council instructing the City Attorney to draft such an ordinance. The ordinance gave the whole jurisdiction in the matter to the City Attorney, who states that he will begin work on the ordinance immediately and confer with various city officials regarding the subject.

MISCELLANEOUS

Brockton Gets a Picture

Brockton, Mass.—The Brockton Woman's Club formally presented to the city an oil painting, "The Brook," by John Enneking. The presentation was in the office of Mayor Perry C. Howard at the City Hall. The picture will be displayed in the municipal art gallery at the public library.

Planning a New Bangor

Bangor, Maine.—Following the disastrous fire of May 1 plans are being made for rebuilding the burned district with new arrangement of streets. There is a movement to create a large park along Kenduskeag stream, which shall be faced by public buildings. Plans for scores of new business blocks and residences are being made. Wooden structures will be prohibited in the business section.

Plan Bonus System for Park Employees

Los Angeles, Cal.—Arrangements will be made by the Park Commission, if possible, to institute a bonus system for the employees of the department, somewhat similar to one in use on the aqueduct and which has made it possible to break world records in hastening that project. The plan of the Commissioners, which is somewhat in embryo at present, is to offer a certain amount—\$5 has been suggested—to each workman in that park which wins the quarterly prize for merit and efficiency. Under the merit system the present Park Board has succeeded in greatly increasing the efficiency of the park workmen, in addition to effecting a considerable saving in cost of upkeep. Figures showing the averages for economy and efficiency in all the parks except Central, Griffith and Exposition, for the quarter ended March 31 have been approved by the Board, and for the second time the prize has gone to M. F. Duncan, foreman of Sunset Park. Considerable rivalry already is shown among the different park foremen to increase their average and it is believed the spirit could be still further augmented, especially among the laborers, if the bonus system was put

into effect. The members of the Commission are in doubt as to exactly what procedure should be taken, and the Council will be asked to provide a way—probably by ordinance.

Municipal Spelling Book

Milwaukee, Wis.—Milwaukee is to have a municipal spelling book after the teachers in all grades make reports next January of the words most frequently misspelled in their classes. The School Board has so ordered.

Gives 5,000 Trees to School Children

Gloucester, Mass.—Through the generosity of William G. Brown, of the Boston Store, 5,000 trees were distributed among the school children to be planted on Arbor Day. The trees were yearling catalpas, a hardy North American tree which grows readily and rapidly in New England soil and bears a large, handsomely formed leaf.

Harrisonburg Favors Compulsory Education

Harrisonburg, Va.—In a special election recently Harrisonburg decided in favor of compulsory education by a vote of 248 to 11. Harrisonburg is the second place in Virginia to vote on this question since the passage of the referendum or enabling act by the General Assembly of Virginia in 1908.

City Planners Will Inspect Kansas City

Dallas, Tex.—As many members of the incoming and outgoing city administration as can arrange to do so, together with members of the Dallas City Plan and Improvement League and other interested citizens, will some time during the next three weeks visit Kansas City to witness the work that has there been accomplished toward making that a better city in which to live. This was decided at the conference between George E. Kessler, the city planning engineer, and the new and old boards of municipal commissioners and officers of the City Plan and Improvement League. The suggestion to make the trip was an unexpected incident of the morning's proceedings, but no sooner had it been made than it met with a cordial response.

Plan Forty-Foot Lots and No Alleyways

Milwaukee, Wis.—The Milwaukee of the future will be a city without alleys and with lots 40 feet wide in the residence districts. During the discussion in the office of Tax Commissioner Schutz last week of the proposed new unit system for assessing real estate, it developed that members of the real estate board are already platting residence property with 40-foot lots and without alleys. It was stated that alleys are a disadvantage. They are disease breeders and refuse collectors. They detract from rather than add to the value of adjoining property. Many of the new subdivisions recently planned are without alleys and eventually all alleys in the city will be done away with. Existing ones will be added to adjoining property or done away with in some other manner.

Conducts Municipal Employment Agency with Success

Washington, D. C.—Municipal employment agencies are being conducted with great success in many European countries. Especially is this true in Norway, where the Government endeavors to keep its army of unemployed as small as possible. The following report from Emerson Taylor, American Consul at Stavanger, Norway, is of interest in this connection. "The Stavanger City Employment Bureau report for the year 1910 has just been made public, and indicates the bureau's increasing utility to both employers of labor and laborers seeking employment. The bureau is a municipal institution, maintained entirely at the expense of the city, under the management of a superintendent appointed by the city government. The salaries and all other expenses are paid out of the city treasury, and no charge is made either to the workmen seeking and finding employment by means of the bureau, or to the employers of labor when workmen are found for them. Although in 1910 a smaller number of men sought employment through the bureau than in 1909, in which year labor conditions were very unfavorable, employment was found for a larger number of men in 1910 than in 1909. The increase in business in the women's department was more marked than in that for men. When both departments were under one management the former was little used, but the city has now appointed a woman as manager.

Kenosha Opens New City Hall

Kenosha, Wis.—The city of Kenosha dedicated its new city hall last week with elaborate ceremonies, large delegations being present from Racine, Waukegan and other nearby cities, including a delegation of more than 50 members of the State Legislature.

Children Plant Twelve Thousand Trees

South Bend, Ind.—Twelve thousand flowering catalpa trees were planted by the South Bend school children in commemoration of Arbor Day. This number breaks all records for northern Indiana. Lectures on care of trees also played an important part in the celebration of the day.

To Have Censor for Moving Picture Shows

Harrisburg, Pa.—Among the measures passed last week was one by Representative Allen providing for an official censor of moving pictures. This establishes the office of Examiner, who is to inspect all films and stereopticon views and approve only those which do not tend to "debase or corrupt morals," and who is to be paid \$3,000 a year. A fee of \$1 for films and 10 cents for separate views is provided, the money to go to the State, and violation of the act is to be punished by a fine of from \$50 to \$100.

\$500 Appropriation for School Gardens

Providence, R. I.—A resolution to appropriate \$500 for the maintenance of school gardens, recommended by Superintendent of Schools Randall J. Condon, was adopted by the School Committee of the City Council after a short period of debate as to the propriety of appropriating money when the School Department was facing a deficit.

May Introduce Fly-Catching Birds in War on Mosquitoes

Trenton, N. J.—The suggestion has been made that the so-called fly-catching bird that eats both flies and mosquitoes be imported into the State in large numbers. It is believed that if the multiplication of these birds was encouraged in sections troubled with mosquitoes the nuisance would be materially decreased. The State Health Department is investigating the practicability of the scheme.

Free Libraries for Small Towns

Nashville, Tenn.—Plans are now on foot for the beginning of the free library system for rural towns and small cities in Tennessee. In 1909 the General Assembly enacted a law creating a free library commission and the present General Assembly made an appropriation of \$2,500 per year to carry on the work. While the library has gotten a start during the last two years, practically nothing definite could be done until the present appropriation was made. If matters are settled satisfactorily at the State Capitol and the money is delivered into the hands of the library commission within a month or two all plans will be in readiness to proceed with the establishment of reading rooms and libraries throughout the State.

Prepares Course in Civics

Indianapolis, Ind.—An outline of study of civic conditions for the use of civic classes in grade schools has been prepared by Dr. Charles S. Woods, Secretary of the City Board of Health, and has been approved by C. N. Kendall, Superintendent of Schools. A copy of the outline and a letter is being mailed to each school principal. The course of study is intended to teach children the duties of the various city departments in assuring sanitary conditions and also to teach them to observe closely whether various contracts are being executed properly. As prepared by Dr. Woods, the outline plans close study of the disposal of garbage, calling attention to the contract of the Indianapolis Sanitary Company for removing it, and stating how garbage should be prepared for removal. Attention is also called to the fact that ashes, cans, etc., should be removed by the city contractors. Sewers, streets and alleys are suggested for close study, this to cover the sewer plan of the city and to teach the children what is necessary to keep streets and alleys in proper condition. There are also suggestions for caring for vacant lots and for improving the banks and beds of streams.

Fountains Will Be Placed in Schools

Portland, Ore.—Bubbling drinking fountains will be placed in all the public schools, according to a decision of the

School Board, and School Architect Jones has been directed to prepare plans and specifications for the installation of such fountains in 14 of the school buildings at once. According to an ordinance the School Board is compelled to install fountains.

San Antonio Plans City Beautiful

San Antonio, Tex.—A call has been issued by the City Improvement League for a "city beautiful" convention to consist of delegations from all civic organizations and the public generally to consider ways and means for bringing to San Antonio a noted civic expert, or "city architect," to lay out comprehensive plans for a boulevard system, beautify the San Antonio River and to beautify the city in other ways. The Real Estate Exchange, which has appointed a committee to co-operate with the Civic Improvement League, the Chamber of Commerce, the Farmers' Institute, the International Federation of Woman's Clubs, the City Association and other interested organizations, is asked to be represented in force.

City Plans to Own Newspaper

Los Angeles, Cal.—Members of the City Council are planning the details of the municipal newspaper sanctioned under an amendment to the charter which carried by large vote at the last election. Thirty thousand dollars will be required to finance the publication for the first year, and some of the Good Government officials are scratching their heads in perplexity because strong opposition has developed to such an appropriation. As at present planned, largely in line with the suggestions of ex-Mayor Dunlop of Hollywood, father of the idea, the paper is to be a weekly, will be conducted by a municipal newspaper department under the control of an unpaid commission composed of three Councilmen. There will be no subscription price, but a copy will be furnished free to every registered voter in the city. Commercial advertising may be accepted at rates to be fixed by the commission. Political intelligence and news about subjects related to municipal affairs are to constitute the particular field. There are provisions permitting each political party to supply news matter at fixed amounts of space and requiring that the newspaper shall favor all enterprises for which the city stands.

Insure Students to Protect Bond Issue

Rogers, Ark.—To protect a bond issue of \$35,000 to the Board of Education, in order that a new high school building may be built, the lives of 18 young men were insured here to-day for \$1,000 each. The board will pay the premiums on the policies.

Distribution of Trees

New Bedford, Mass.—Following close on the removal of the big elms from around the Free Public Library comes the activity of the Board of Trade and Horticultural Society, whose joint committee is raising funds for the distribution of trees. This committee has decided to follow the example of Providence, and set the trees out in residential districts, especially in the tenement neighborhoods. Ten residential portions of the city will be divided into sections with a man in charge of each section, and an effort will be made to have the boys and girls of the city co-operate. The cost of setting up a tree and maintaining it for one year is \$3, and the committee is asking for contributions of a tree instead of \$1. One man has offered to give four or five trees provided they will be set out in front of his house.

Children's Bureau Asked of Council

Milwaukee, Wis.—Resolutions asking the appointment of a commission of not more than five members, to be chosen by the Mayor, "for the purpose of studying and investigating conditions relating to infant mortality and child welfare," were adopted at a recent meeting of representatives of fourteen charitable and philanthropic associations and societies. A committee was appointed to secure the introduction of the resolutions into the Common Council. Another resolution was adopted petitioning the Common Council, "without regard to party affiliations, to grant immediately as large an appropriation as possible for child welfare work, to be spent in co-operation with the commission." Wilbur C. Phillips, child welfare worker from New York, who has come to Milwaukee to aid in the establishment of a bureau, gave a short account of the work in New York and made suggestions for Milwaukee.

LEGAL NEWS

Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Taxation—Counterclaim.

Village of Charlotte vs. Keon.—In an action by a village delinquent taxes a counterclaim for a debt due from the village is not available.—New York Supreme Court, 128 Y. S., 80.

Laying Out and Altering Streets

City of Hartford vs. Poindexter.—In laying out and altering streets and establishing building lines, municipal authorities act under special and limited authority as inferior tribunals, and hence there is no presumption in favor of their jurisdiction, which may be attacked collaterally, so that a recital of the performance of the things requisite to jurisdiction in the final proceedings of a City Council establishing the improvement and confirming an assessment therefor is insufficient to establish a prima facie case in a suit to foreclose the assessment lien, and the burden is on the plaintiff to prove that all the proceedings taken were in accordance with the charter. The record of proceedings for street improvement, taken in 1871, began with what purported to be a report of the highway committee in the matter of laying out a street and building lines on both sides of A. avenue. The preamble of the report purported to give the building line, and the report then stated that each line was described in a resolution establishing the same, reciting the resolution which was identical with one passed four years before by the Common Council establishing and laying out the same avenue, but containing no reference to building lines. Held, that the laying out of the avenue and the establishment of building lines were independent improvements, and, there being nothing to show publication of the necessary notice to property owners of the proposed vote establishing building lines, an assessment levied therefor was void.—Supreme Court of Errors of Connecticut, 79 A. R., 80.

Architects' Contract for City Building

Bernstein et al. vs. City of New York.—Architects' contract to furnish plans for a municipal building provided for payment of 1 per cent. on completion of the drawings, etc., called for in a certain clause of the contract, which required that the estimated cost of the building should be less than \$48,000, and provided that the preliminary plans could be revised to meet a commissioner's requirements. The plans were abandoned, because, as so revised, they called for a building costing much more than \$48,000. Held, that the architects are not entitled to the 1 per cent. fee provided for in the contract.—New York Supreme Court, 127 N. Y. S.; 987.

Laying Pipe in Highway—Injunction.

Mayor and Council of City of Bayonne et al. vs. Mayor and Council of Borough of North Arlington.—Where a corporation asks a court of equity to restrain a municipality from interfering with it in the excavation of a public highway for the purpose of laying a water pipe across it as a part of a pipe line system, the corporation must show a legal right to use the street for the purpose intended. The right to regulate is not limited to mere supervision of the method of excavation, but implies the power to prohibit the disturbance of the public easement by one who has no legal right to do it. A permit to lay water pipes in a public street can only be claimed by one legally entitled to use the street for such purpose, and if one, without such right, attempts to excavate a street for such purpose, a court of equity will not restrain a municipality having the power to regulate the use of streets from forcibly preventing the disturbance of the public easement. Assuming that a permit would be granted upon reasonable conditions to one legally entitled to lay such pipe in a public highway, the prevention of such use of the highway by one without a legal right is a lawful exercise of the power to regulate the use of such a highway.—Court of Errors and Appeals of New Jersey, 79 A. R., 358.

Street Assessments—Action to Invalidate

Whetsell et al. vs. City of Elkins et al.—As the section of a street between two cross streets or a cross street and an alley is the unit for paving, established by Section 34 of Chapter 47 of the Code of 1906, a bill to enjoin collection of special assessments made under that section, on the ground of lack of a sufficient petition to the council by property owners, must be confined to property on the particular section in respect to which the petition is insufficient and owners thereof, and cannot extend to property on more than one section or the owners thereof.—Supreme Court of Appeals of West Virginia, 70 S. E. R., 754.

License Tax—Recovery

Wood-Mendenhall Co. vs. City of Greer.—The powers of a municipal corporation must be exercised in strict conformity to the grant, and an ordinance imposing a license on a business is void if it does not graduate the license under Civil Code, 1902, requiring the license to be graduated according to the gross income of the person, etc., required to pay it or upon the amount of the capital stock invested in the business. The proper course for one claiming the invalidity of a license tax imposed upon a business is to pay the tax under protest and sue the city to recover the amount paid.—Supreme Court of South Carolina, 70 S. E. R., 724.

Defects in Streets—Contributory Negligence

Hysell vs. Central City.—If a traveler on a public road or street negligently sustain injuries from open and apparent defects therein, of which his observation prudently exercised would or ought to have informed him, he is guilty of contributory negligence, precluding recovering of damages for the injuries thus sustained. When the facts showing such contributory negligence are undisputed, the question becomes one of law for the court and not of fact for jury decision.—Supreme Court of Appeals of West Virginia, 70 S. E. R., 767.

Regulation of Rates for Public Service

Bluefield Waterworks & Improvement Co. et al. vs. City of Bluefield et al.—In the absence of a delegation thereof by the Legislature, express or necessarily implied, a municipal corporation has no power to regulate or control rates for public service, such as the furnishing of water, gas, or electricity, or the terms and conditions of contracts therefor, otherwise than by contract with the corporation or person rendering such service. Though such regulation is usually in the form of an ordinance, it is nevertheless contractual or administrative in character, and not enforceable by criminal penalties, except in those instances in which the Legislature has delegated to the municipal corporation power and authority to enforce compliance therewith in that way. Authority in a municipal charter to pass all ordinances necessary to the execution of the powers vested in the city and such as may be deemed necessary and proper to conserve the health, comfort, happiness and convenience of its inhabitants and enforce the same by reasonable fines and penalties does not include power to regulate or control such public service rates and conditions otherwise than by contract, nor to enforce regulation so made by fines or criminal penalties. Attempted enforcement of contractual regulations of public service, by criminal proceedings under an ordinance of a city not authorized by legislative enactment to adopt such means of enforcement, may be enjoined.—Supreme Court of Appeals of West Virginia, 70 S. E. R., 772.

Unskilled City Employee—Wages

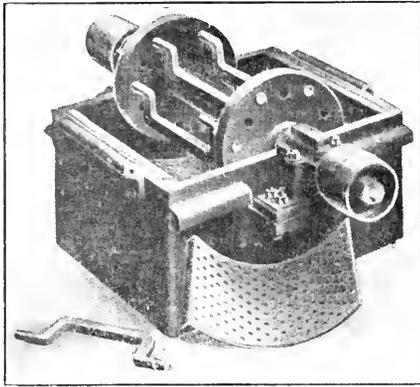

Walsh vs. City of New York.—Where plaintiff worked for a city as an unskilled laborer, and was paid when he actually worked, and if the weather did not permit him to work he was not paid, and he was laid off, held he was not entitled to wages for the days he did not work. That a laborer was removed or suspended because he was a henchman of one faction of a political party which was in disfavor with his superior officer, and that the formality of recertification of his name to the Civil Service Commission was not observed, putting him out of line for re-employment, would not render the city liable for wages while he did not work, especially where, within two months of his laying off, his name was placed upon the certified list.—New York Supreme Court, 127 N. Y. S., 972.

MUNICIPAL APPLIANCES

Plant for Grinding Garbage

The accompanying illustrations show the construction and equipment of the Southwark garbage grinding plant referred to in the Municipal Journal, April 12, page 518. Southwark is a borough of London, England. To this plant is brought the ashes, garbage and refuse from the East Side of London. The different kinds of waste are not separated, but are placed in cans by the householder and brought to the grinding plant in carts. The plant has been established about four years and handles about 500 tons a day, the running time of the four Gardner crushers which are used to grind it being only five hours a day.

The sketch shows the general ar-

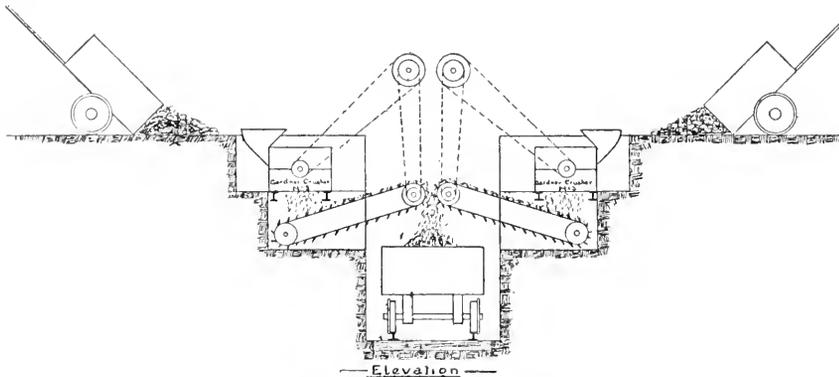

GARDNER CRUSHER AND PULVERIZER

angement of the installation. A roof, not shown, covers the machinery. The crushers are elevated and located two on each side of a tramway over which the cars that carry away the finished product run. Carts deliver the waste near the hoppers of the crushers. At this point, such materials as have value, leather, bottles, iron articles, etc., are picked out by hand. The remainder is shoveled into the mouths of the crushers which have 12 by 14-inch openings. From the crusher the ground material is elevated and carried to the cars. The waste, when it arrives at the plant, has so much garbage in it that it has an offensive smell. The product is a fine material, grading from quarter-inch to powder. It has no disagreeable odor, the gases presumably being absorbed by the carbon contained in the ashes. The product has a yellowish color, much like earth discolored about a leak

in a gaspipe. Although the waste contains considerable paper, not a trace of it is visible in the ground material. It is carried by the tram cars out into the farming districts where it finds a ready sale at a moderate price as a fertilizer. The power required to operate the plant is 100 hp, and the grinding operation so rapid—100 tons an hour—that it is not necessary to run the plant more than half a day to take care of the 500 tons, the usual amount collected.

The Gardner crushers used in this plant are No. 3, the largest size. Their construction and operation is peculiar. The crusher consists of a very strong cast iron frame in two parts, a base and a top, which fit together with a machined joint. The sections are hinged to allow quick inspection and cleaning. The main shaft rests on bearings attached to the lower section. These bearings are specially constructed to stand the wear of the shaft, which revolves at 1000 revolutions a minute. Inside the casing are two circular cheek pieces, or disks, which are, in this instance, connected by four beaters or hammers shaped something like brace cranks. These beaters are the working part of the mechanism. They are pivoted to the disk, but when in operation, through centrifugal force, assume a position radial to the line of the main shaft. They are made of manganese steel. The bottom of the apparatus consists of a rounded perforated iron plate which acts as a screen for the discharge of the material. The wear on the screen is said not to be great, one screen generally lasting a year or more. On the inside of the upper casing are substantial rectangular blocks of steel which can be adjusted in relation to the hammers so as to regulate the fineness of the product. The crushing effect is produced not only by the hammers striking on the material, but by the grinding of the particles on each other. The high speed of the hammers is the factor of controlling importance, together with their pivoted construction, which permits them to give way a little to an unusual resistance.

GARBAGE GRINDING PLANT, SOUTHWARK, LONDON

New Motor Combination Hose Wagon

The Northern Fire Apparatus Company, Minneapolis, Minn., has placed an auto combination hose and chemical apparatus on the market. The following are the main points in the specifications:

Motor: Four cylinders, water cooled cast in pairs. All gears encased. Bore $4\frac{1}{4} \times 4\frac{1}{2}$.

Power: Horsepower, 30, A. L. M. A. rating.

Speed: Will carry load of 2,500 pounds at 20 miles per hour.

Hose Capacity: 1,200 to 1,500 feet, $2\frac{1}{2}$ -inch cotton rubber-lined fire hose.

Crank Case: Made in two parts. Disposed horizontally through plane of crank shaft center.

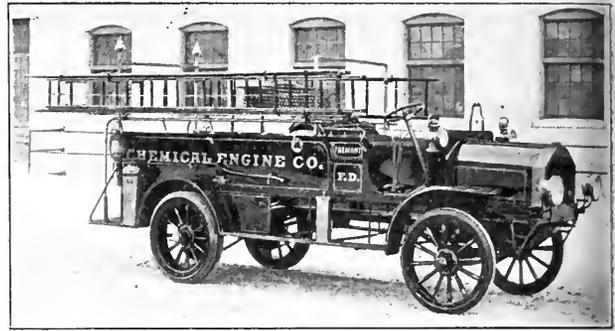

Crank Shaft: Drop forging ground to finish size.

Fly Wheel: Of liberal size and designed to receive cone clutch.

Clutch: Plunger type cone clutch, lined with thermoid friction. Operated by pedal lever.

Bearings: All anti-friction bearing metal.

Lubricating: Furnished by power-driven gear pump, which pumps oil from the oil reservoir from bottom of the motor to the crank case proper. Splash system supplying all parts.

NEW AUTO COMBINATION CHEMICAL

Cooling: By water circulated by gear-driven pump.

Transmission: Selective type transmission mounted on Timken roller bearings throughout.

Drive: Double chain drive.

Brakes: Two sets, one pair on the rear wheels and one pair on jack shafts, both external contracting type.

Control: Throttle and spark levers are located on top of steering wheel, engaged with sector, which is stationary and does not turn with wheel. The three speeds and reverse are operated by the lever at the right of the driver.

Ignition: Double.

Carburetor: Bennett.

Frame: Channel steel of ample size for load and severe service.

Springs: Front springs full elliptic, rear platform type of ample capacity.

Axles: Front $1\frac{1}{2}$ -inch, Timken "T" beam type, with Timken bearings throughout. Rear, 2-inch dead square with wheels, mounted on Timken bearings.

Wheels: Artillery type.

Tires: Front tires are $36 \times 3\frac{1}{2}$ solid Hartford make. Rears are $36 \times 3\frac{1}{2}$ solid Hartford. Tread, 58 inches. Wheel base, 117 inches.

Chemical Equipment.

Cylinder: One 35-gallon, 40-gallon or 50-gallon capacity, seamless, steel cylinder, mounted back of seat.

Acid Receptacle: Best chemical lead held in heavily tinned red brass frame, so arranged that when cap is put on and wheel screwed down receptacle is hermetically sealed and cannot be prematurely discharged.

Method of Discharging: Release stopper by turning cap valve wheel to left and revolve cylinder. This gives positive action and perfect agitation.

Piping: Brass piping and valve so arranged that when cylinder is empty it can be refilled from $2\frac{1}{2}$ -inch intake connection, or plain water run right through instead of chemical.

Hose Basket: Woven wire reinforced with half round steel mounted over bed of wagon. Capacity, 200 feet.

The complement of small tools usually supplied with such apparatus also goes with it.

NEWS OF THE SOCIETIES

Texas Mayors' Association.—Dr. R. H. Greer, secretary, has issued a circular letter inviting eligible officers of all municipalities not belonging to the association to join it and participate in the benefits. At the next annual meeting, he says, special attention will be given to the question of beautifying Texas cities. Another topic to which special attention will be given is the initiative, referendum and recall. Another question that will have full and free discussion will be that of whether cities and towns should have concurrent jurisdiction with the county courts which would enable them to accomplish greater headway toward the building of good roads and better streets.

The secretary states that it is the desire to have a photographic exhibit of the cities and towns which will be represented in the association, showing public buildings, highways, street improvements, parks or anything that will have a tendency to inspire others to greater achievements along this line.

Society for the Promotion of Engineering Education.—The annual convention will be held at the Carnegie Technical School, Pittsburgh, Pa., June 27-29. Plans for the 1911 convention are now being made. The local committee to handle the details has just been appointed by the council of the society. The chairman of the committee is Dr. John H. Leete, dean of the engineering school at Tech. The other members are Charles F. Scott, of the Westinghouse Electric Company; Dr. Bishop, of the University of Pittsburgh, and Dean Connelley and Professor Mott, of the Carnegie Technical schools.

A new and interesting feature to be introduced this year will be the reunions of the faculty members from the various institutions represented in the convention with their graduates located in this district. The very large number of college men holding positions in the various local engineering plants makes it especially possible to schedule a convention feature of this description in Pittsburgh, with every prospect of success. Arrangements will also be made for visits and inspection trips to local points of interest. Prof. Henry H. Norris, Cornell University, is secretary.

International Association of Railway Special Agents and Police.—At the convention which closed in Chattanooga, April 20, the following officers were elected: President, M. B. Earle, Birmingham, special agent Southern Railway; first vice-president, Patrick J. Kindelon, San Francisco, chief special agent Southern Pacific; second vice-president, H. S. Harrod, Buffalo, special agent B. & E.; third vice-president, T. L. Phelps, Bluefield, W. Va.; secretary and treasurer, W. C. Pannell, Baltimore, special agent Chesapeake Steamship Company. Buffalo was selected by acclamation as the meeting place for 1912.

Following a paper by A. W. Worthington, D. M. & N. Railway, on the need of a central bureau of identification it was decided to establish such a bureau, and Mr. Worthington was appointed its head.

Detroit Engineering Society.—At the annual meeting, held April 21, officers for the coming year were elected as follows: President, Ralph Collamore; vice-presidents, Charles Y. Dixon (Amherstburg, Ont.) and Geo. H. Fenkell; secretary-treasurer, Frederick H. Mason, 612 Moffat Building, Detroit, Mich.

Calendar of Meetings

- May 15-17. National Conference on City Planning.—Philadelphia, Pa.—Flavel Shurtleff, Secretary, 19 Congress street, Boston, Mass.
- May 17. Massachusetts Highway Association.—Quarterly Meeting in conjunction with the New England Conference on Street Cleaning, Springfield, Mass.
- May 17. New England Conference on Street Cleaning.—Springfield, Mass.—Corresponding Officer, Carol Aronovici, 55 Eddy street, Providence, R. I.
- May 18-19. Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25. National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26. National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 25-26. League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2. National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14. National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-10. American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14. National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7. National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 11-16. International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18. New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16. American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22. National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- August 15-18. Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 12-15. International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 19-22. International Association of Fire Engineers.—Annual Convention, Racine, Wis.
- September 19-22. American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30. International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29. American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6. League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

PERSONALS

ATKINSON, ROBERT, field secretary of the Playground Association of America, recently visited St. Paul, Minn., and addressed the recreation and education committee of the City Club.

CROSBY, W. O., has been appointed consulting engineer in connection with the Arrowrock dam of the U. S. Reclamation Service.

CROKER, EDWARD F., ex-Fire Chief of New York City, extended a reception at his new headquarters in the Thorley Building, Forty-sixth street and Fifth avenue, to numerous fire chiefs throughout the country.

CULVER, IRVING, has been elected Mayor of Delmar, Del.

DOW, JOHN B., is the new Mayor of Cookeville, Tenn.

EWART, C. W., has been appointed City Engineer of Aberdeen, Wash.

FOWLER, J. E., has been appointed Health Sergeant of Hutchinson, Kan.

GAMMON, L. H., has been re-elected Mayor of Bristol, Va.

GAY, C. W., has been engaged as Chief Engineer of the Lynn, Mass., Harbor Commission.

GILBERT, H. K., has been re-elected Mayor of Florence, S. C.

GRADY, W. J., has been re-elected Superintendent of the Light & Water Department of Denton, Texas.

HARLOW, GEORGE J., has been appointed Commissioner of Public Works of Mt. Vernon, N. Y.

HESS, W. J., has been elected Mayor of Redondo Beach, Calif.

HOWARD, CHAS. C., is the new President of the Board of Fire Commissioners of Mt. Vernon, N. Y.

KUHN, FRED H., Chief of the Fire Department of Plymouth, Ind., has invented a very ingenious and useful contrivance for fastening and instantly opening the doors of the fire station in case of fire. It is connected with the fire alarm and the first pull of the bell dislocates the fastenings and the four doors fly open.

O'NEIL, GEO., has been appointed Superintendent of the municipal electric light plant of Topeka, Kan.

PIERCE, A. P., is the new Mayor of Red Wing, Minn.

PRESTON, JAMES H., has been elected Mayor of Baltimore, Md.

SCHMIDEL, JOHN E., has been re-elected director of playgrounds of Elizabeth, N. J.

STAMMS, NORMAN L., has been appointed Engineer of the Department of Wharves, Docks and Ferries of Philadelphia.

SYLVESTER, MAJ. RICHARD, in charge of the Police Department of Washington, D. C., and who is President of the International Association of Chiefs of Police, recently called on Chief of Police Quigley of the Rochester force. He was taken on a tour of inspection of the Exchange Street building, and expressed himself in complimentary terms regarding methods in vogue at headquarters, and the general condition of the building and the various devices in use.

THOMPSON, F. M., has been elected Mayor of Salisbury, N. C.

THOMPSON, DR. FRANK S., has been appointed a member of the Board of Health of Dayton, Ohio. The appointment is for five years. Dr. Thompson formerly served as dairy inspector, an office which he resigned owing to the demands of his private practice.

WEBER, WALTER H., was elected Mayor of Havre de Grace, Md., as the result of a hotly contested election.

TRADE NOTES

Cast Iron Pipe.—Birmingham: With the exception of a large letting in Kansas City, there is little tonnage before the trade. Shipments remain fairly good. Quotations: 4 to 6-inch, \$22.50 to \$23; 8 to 12-inch, \$22 over 12-inch, average, \$21. San Francisco: Business continues to come out in good volume both from municipalities and private corporations. New York: Buying continues extremely light. Prices show no indication of strengthening. Quotations: 6-inch, car loads, \$21 to \$22.

Lead.—Market is weak and neglected. Quotations: New York, 4.425¢; St. Louis, 4.425¢.

Street Cleaning.—Daniel J. Hauer, Consulting Engineer, Park Row Building, New York, N. Y., has published a brief pamphlet stating that he expects to devote considerable of his time to problems of street cleaning. He states that by improved methods and system the ordinary cost of street cleaning may be reduced and the streets kept cleaner. The troublesome snow problem, he says, can be easily cared for and the cost of removal reduced.

Road Machinery.—The Good Roads Machinery Company, New York City, have moved their office to 18 Old Slip, cor. Water street. They are the selling agents for the American Road Machine Company, the Climax Road Machine Company, Indiana Road Machine Company and Monarch Road Roller Company.

Gravity Concrete Mixer.—C. Raymond Weaver, of the Hains-Weaver Concrete Mixer Company, 13 Park Row, New York City, has issued an announcement to the effect that the partnership previously existing between C. Raymond Weaver and Peter C. Hains has been terminated. The Hains Concrete Machinery Company, Washington, D. C., has no connection with the Hains-Weaver Concrete Mixer Company. Each member of the former partnership has the right to manufacture and sell the gravity mixer which was the joint invention of C. Raymond Weaver and Peter C. Hains. The Hains-Weaver Concrete Mixer Company is selling Hains-Weaver mixers which are stated to have many improvements over the old style sold under the name of Hains mixers.

Rubber Tires.—The Fisk Rubber Company, Chicopee Falls, Mass., has been awarded a contract for equipping the chiefs' cars of the New York Fire Department with Fisk pneumatic tires. These tires were selected after tests were made under the direction of Commissioner Waldo, who uses a Lozier car equipped with Fisk tires. The Springfield, Mass., Fire Department also uses Fisk pneumatic tires.

Garbage Reduction.—The Sanitary Machine Company has been incorporated at Buffalo, N. Y., with a capital stock of \$25,000 to manufacture machines for the automatic extraction of grease, fertilizer products and other by-products from city garbage and to build and operate garbage reduction plants in cities. W. D. Huntington, general manager of the Buffalo Fertilizer Company, is president of the new company; Henry Thieroff, chemist and superintendent of the Buffalo Fertilizer Company, vice-president; and William H. Hotchkiss, secretary and treasurer. The offices of the company are at 62 and 64 Pearl street, Buffalo.

Fire Alarm Boxes.—The Star Electric Company, Binghamton, N. Y., have received an order from the New York City Fire Department for 150 of their fire alarm boxes.

Testing Laboratory.—The Pittsburgh Testing Laboratory, Pittsburgh, Pa., has moved into its new five-story office and laboratory building at the corner of Seventh and Bedford avenues, where it will have more complete facilities for looking after its clients. This plant is claimed to be the largest of its kind in the country.

Sewer Pipe.—The attention of men interested in the sewer pipe business all over the country has centered upon a meeting of prominent men in the industry at Chicago two weeks ago. Among those present were: George R. Hill, president of the American Sewer Pipe Company; also Vice-President Stambaugh, Secretary A. S. McCombe and other officials connected with the Akron, O., works. There has been much complaint that the sewer pipe prices, during the past few years, have been so low that little or no profit has been left in the business. It is expected that a price agreement rather than a merger will be the result of the meeting.

PATENT CLAIMS

990,255. MANUFACTURE OF WATER-METER DISKS. William L. Gumprecht, New York, N. Y., assignor to Neptune Meter Co., New York, N. Y., a Corporation of New Jersey. Serial No. 487,727.

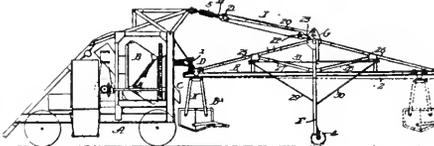

A meter disk comprising a laminated body of fibrous material and rubber and an outer protective coating of rubber, the whole being vulcanized.

990,521. PROCESS OF EXTINGUISHING FIRES. Max Breslauer, Charlottenburg, Germany, assignor to The Firm of Minimax Consolidated Limited, London, England, and Neuruppin, Germany. Serial No. 385,665.

The process of extinguishing fires from burning benzine, kerosene oil, petroleum and other easily inflammable liquids consisting in adding free uncombined bromine to said burning liquids, substantially as herein described.

990,513. MACHINE FOR USE IN STREET-PAVING WORK. Charles E. Bathrick, Chicago, Ill., assignor to Frederick C. Austin, Chicago, Ill. Serial No. 496,013.

In a machine of the class set forth, the combination of a motor truck or carriage provided with a mixer; a boom attached at one end portion to the motor truck or carriage by a hinge connecting means permitting the boom to swing laterally and also to have an up and down swing; a delivery hopper or receptacle for receiving material from the mixer and delivering the same at points more or less remote therefrom; a shifting connection between the delivery receptacle and the boom and movable along the latter in order to shift the position of the delivery receptacle in accordance with need; spring means interposed in connection between the motor truck or carriage and

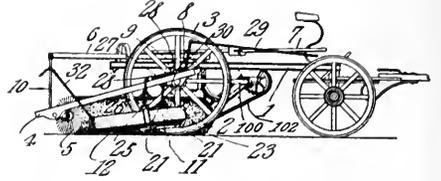

the boom and adapted to normally maintain the boom in level or substantially level position to provide a suitable track or way; and a prop or leg device attached and depending from the boom, the prop or leg device being clear of the ground when the boom is maintained in level or substantially level position by the spring means, and being of a length to engage and bear upon the ground and sustain the weight of the boom and the loaded receptacle when the boom is depressed by reason of its weight augmented by the weight of the loaded receptacle, the spring means being adapted to yield to an extent to permit said depression on the part of the temporarily weighted boom, but opposing such depression with an increasing spring resistance

suitable to restore the boom to its normal position after the boom has been suitably relieved of the weight of the load thereon.

990,322. ATTACHMENT FOR STREET-SWEEPERS. John Wless, Chehalis, and William McArthur, Tenino, Wash. Serial No. 536,255.

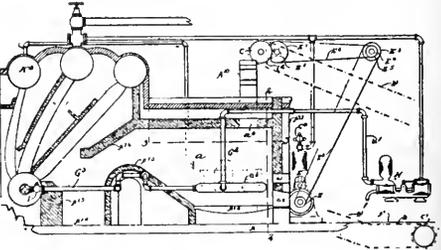

In a device of the class described, a sweeper comprising a frame; an axle carried by the frame; traction wheels mounted upon the axle; and an arm rearwardly extended

from one end of the axle upon the exterior of one wheel; a rotary brush journaled at one end in the arm; a pan suspended from the sweeper beyond the wheel and in close proximity to one end of the brush; and means mounted upon the arm for dumping the pan.

990,688. APPARATUS FOR TREATING GARBAGE. John G. Walker, New York, N. Y., assignor to John G. Walker, Seawaren, N. J., and Adolph Kern, New York, N. Y. Serial No. 410,235.

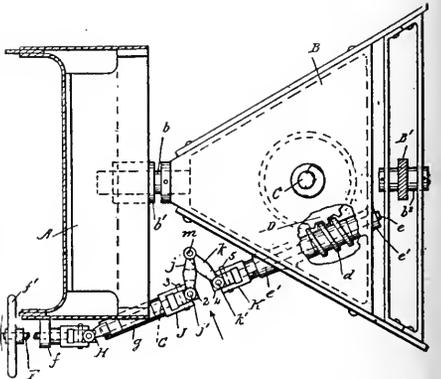

In a device of the class described, a furnace, a plurality of approximately flat grates one above the other within said fur-

nace, a high firebridge extending upward from the lowermost grate and in operable relation with both said grates, said firebridge being formed with a long inclined front face, a smoothly rounded top and a vertical rear wall, in combination with a curved and drooping arch above said firebridge and extending beyond the rear wall of said bridge, the whole arranged to provide a contracted passage for the gases, the product of combustion in said furnace.

990,794. STEERING MECHANISM FOR ROAD ENGINES. Gustaf Arvid Anderson, Waynesboro, Pa., assignor to The Geiser Manufacturing Company, Waynesboro, Pa. Serial No. 534,041.

In a steering mechanism, the combination, with stationary supports, of a rocking frame provided with pivots arranged horizontally and in line with each other and engaging with the stationary supports, a steering shaft journaled in the rocking frame crosswise, between the said pivots, an

intermediate shaft carried by one of the stationary supports and arranged at an angle to the axis of said pivots, an operating shaft journaled in the rocking frame and normally arranged in line with the said intermediate shaft, universal coupling-members secured on the adjacent end portions of the operating shaft and the intermediate shaft, links pivoted together and to the said universal coupling-members, and driving mechanism connecting the operating shaft with the steering shaft.

THE MUNICIPAL INDEX

In Which Are Listed and Classified by Subjects All Articles Treating of Municipal Topics Which Have Appeared During the Past Month in the Leading Periodicals

It is our purpose to give in the second issue of each month a list of all articles of any length or importance which have appeared in all the American periodicals and the leading English, French and German ones, dealing more or less directly with municipal matters. The index is kept up to date, and the month of literature covered each time will be brought up to within two or three days of publication. Our chief object in this is to keep our readers in touch with all the current literature on municipal matters. In furtherance of this we will furnish any of the articles listed in the index for the price named after each article, except that where an article is continued in two or three issues of the paper, the price given is for each of said issues. In addition to the titles, where these are not sufficiently descriptive or where the article is of sufficient importance, a brief statement of its contents is added. The length also is given, and the name of the author when it is a contributed article.

ROADS AND PAVEMENTS

Road Improvement in the United States in 1910 and 1911. Illustrated, 13 pp., Good Roads, April. 10 cts.

Highway Work in Saskatchewan. From annual report of F. J. Robinson. Illustrated, 5 pp., Canadian Engineer, April 27. 15 cts.

Highways in Massachusetts Illustrated, 7 pp., Public Officials' Magazine, March. 10 cts.

German Methods of Road Work. Paper before Iowa Engineering Society. By E. Schreiner. 1 1-2 pp., Good Roads, April. 10 cts.

Colinsville—East St. Louis Road. Paper before Illinois Society of Engineers and Surveyors. By A. N. Johnson. Illustrated, 1 1-2 pp., Good Roads, April. 10 cts.

Association, Road Improvement. Extracts from annual report. 1 1-2 pp., Surveying, April 21. 20 cts.

Commission, State Highway, and Trunk Lines. By W. W. Crosby. Illustrated, 3 pp., Southern Good Roads, April. 10 cts.

Road Question Viewed Generally. Paper before Second Irish Road Congress. By P. C. Cowan. 3 pp., Surveyor, April 21. 40 cts.

Highway Design, Relation Between Modern Traffic and the Alignment and Profile in. Paper before American Association for the Advancement of Science. By H. B. Drown. 2 1-2 pp., Canadian Engineer, April 6. 15 cts.

The Bond of a Road. By J. S. Robeson. 3 pp., Municipal Engineering, May. 25 cts. **Improvement of Highways to Meet Modern Traffic Conditions.** Paper before Institution of Civil Engineers. By J. Walker-Smith. 1 p., Surveyor, April 7. 40 cts.

Suggestions Regarding Road Improvement. Paper before New Jersey Association of County Engineers. By F. J. Eppel. 2 1-2 pp., Good Roads, April. 10 cts.

Wheel Loads and Tire Widths. Summary of regulations in different counties. 5 pp., Surveyor, April 21. 40 cts.

Traffic Census on Highways. Methods of Taking. Paper before the American Association for the Advancement of Science. By A. H. Blanchard and J. W. Patterson. 3 pp., Canadian Engineer, April 6. 15 cts.

Tamping Macadam Road Bases. 1-3 pp., Engineering Record, April 22. 10 cts.

Sand Clay Road, How to Build a. By M. G. Homes. 1 p., Southern Good Roads, April. 10 cts.

The First Sand Clay Road. By I. E. Watson. Illustrated, 2 pp., Southern Good Roads, April. 10 cts.

Bituminous Macadam, Gravel and Earth Object Lesson Roads Constructed by the U. S. Office of Public Roads. 3 1-2 pp., Engineering-Contracting, April 5. 10 cts.

Contract and Day Labor Methods of Doing Bituminous Road Work. From discussion before American Society of Civil Engineers. 3-4 p., Engineering-Contracting, April 26. 10 cts.

Road Construction with Bituminous Material by Mixing Methods. From discussion before American Society of Civil Engineers. 6 pp., Engineering-Contracting, April 26. 10 cts.

Some Details of Bituminous Macadam Construction. By J. T. Voshell. Paper before Ohio Engineering Society. 2 pp., Good Roads, April. 10 cts.

Tarring Roads and Eye Troubles. By Albert Scheible. 1-2 p., Municipal Journal, April 26. 10 cts.

Road Construction with Bituminous Materials by the Penetration Method. From discussion before American Society of Civil Engineers. 3 pp., Engineering-Contracting, April 19. 10 cts.

Present Status of the Use of Bituminous Materials in the Construction and Maintenance of Roads in the United States. Paper before American Association for the Advancement of Science. By A. H. Blanchard. 2 1-2 pp., Canadian Engineer, April 13. 15 cts. 2 1-2 pp., Good Roads, April. 10 cts.

Road Preservation and Dust Prevention by Surface Treatment with Tars, Heavy

Oils, etc. From discussion before American Society of Civil Engineers. 5 pp., Engineering-Contracting, April 12. 10 cts.

Tarring and Gritting of Road Surfaces. By Wm. Oxtoby. 2 pp., Surveyor, April 14. 30 cts.

Maintenance, Permanent, and Skilled Supervision of Roads. By Curtis Hill. Illustrated, 3 pp., Southern Good Roads, April. 10 cts.

Development of Road Maintenance System for Menominee County, Michigan. By K. I. Sawyer. 1 p., Good Roads, April. 10 cts.

Culverts for Highways, Concrete. By Paul Chesterton. Illustrated, 1 pp., Cement World, April. 15 cts.

Culvert Construction. Paper before Commissioners' and Supervisors' Convention of Nebraska. By Peter Campbell. Illustrated, 3 pp., Pacific Municipalities, March. 20 cts.

Tree Planting on Highways. Paper before Kansas Engineering Society. By E. F. A. Reinisch. 1 p., Good Roads, April. 10 cts.

Stone Testing Machine, A Suggested Road. By R. J. Kirwan. Illustrated, 1 p., Surveyor, April 21. 40 cts.

Specifications, Paving, Proceedings of the Association for Standardizing Paving Specifications. 1-3 p., Municipal Journal, April 12. 10 cts.

Recommendations for Use in Chicago Street Paving Specifications. Report to Chicago Commission on City Expenditures. By S. Whinnery. 1-2 p., Engineering News, April 20. 15 cts.

Granite Block Specifications. Standard of the Association for Standardizing Paving Specifications. Coal tar, asphalt or cement grout filler; one year guarantee. 1 1-2 pp., Municipal Journal, April 26. 10 cts.

Wood Block Paving, Specifications for. By S. Whinnery. 1 1-2 pp., Engineering News, April 27. 15 cts.

Notes on Creosoted Wood Block Pavement. By Paul E. Green. 1 1-2 pp., Engineering News, April 20. 15 cts.

Creosoted Wood Block Pavement at Minneapolis. 1-3 p., Engineering Record, April 8. 10 cts.

Nine Years' Experience with Creosoted Wood Block Pavement, Minneapolis. By E. H. Durham. Illustrated, 2 pp., Engineering-Contracting, April 19. 10 cts.

Concrete Street Paving in Mason City, Ia. Paper before Iowa Engineering Society. By F. P. Wilson. 1 1-2 pp., Cement Age, April. 15 cts.

Cement Concrete in Highway Construction. Paper before Canadian Cement and Concrete Association. By W. A. McLean. 2 pp., Canadian Engineer, April 13. 15 cts. 1 p., Good Roads, April. 10 cts.

Cement Street Construction. By F. W. Hagloch. Illustrated, 2 pp., Cement World, April. 15 cts.

Concrete Properly Laid. Has advantages over other paving materials. By C. P. Chase. 5 pp., Concrete, April. 15 cts.

Standard Paving Specifications. Adopted this year by Association for Standardizing Paving Specifications. Concrete pavements, foundations and sidewalks; wood block. 1 p., Municipal Journal, April 12. 10 cts.

Rock Asphalt for Street Purposes. Paper before Institution of Municipal Engineers. By Edward Walker. 1 1-2 pp., Surveyor, April 14. 40 cts. 2 pp., Surveying, April 14. 20 cts. 1 p., Contract Journal, April 5. 20 cts.

Brick Paving Specifications. Standard of the Association for Standardizing Paving Specifications. Preparing sand cushion; expansion joints; grout, pitch and asphalt fillers. Illustrated, 2 pp., Municipal Journal, April 19. 10 cts.

Cracking of Cement Grouted Brick Pavements. Paper before Michigan Engineering Society. By E. R. Whitmore. 4 pp., Cement, March. 25 cts.

Brick Country Roadway at Newman, Ill. Illustrated, 1 1-2 pp., Clay Worker, April. 25 cts.

Specifications for New Standard Brick Rattler. Illustrated, 2 1-2 pp., Good Roads, April. 10 cts.

Pavement Situation in New York. 2 pp.,

Bulletin of General Contractors' Association, April.

Prices, Average Unit, of Pavements Constructed in 1910 in a Number of American Cities. 3 pp., Engineering-Contracting, April 5. 10 cts.

Private Street Works under the 1892 Act. Notes on. By M. B. Bennett. 2 1-2 pp., Surveyor, April 7. 40 cts.

Street Plan, Mitigating the Gridiron. Some good effects achieved in New York City. By F. K. Winkler. Illustrated, 18 pp., Architectural Record, May. 25 cts.

Sidewalk Construction, Some Fallacies of. By J. B. Landfield. 1 1-2 pp., Cement Age, April. 15 cts.

Asphaltic Oils Economical Wood Preservers. By F. W. Cherrington. 3 pp., Municipal Engineering, May. 25 cts.

Analyzing Coal Tar Creosote. From Bulletin American Railway Engineering and Maintenance of Way Association. Illustrated, 1 p., Municipal Journal, April 12. 10 cts.

Methods of Testing Coal Tar and Refined Tars, Oils and Pitches Derived Therefrom. From Journal of Industrial and Engineering Chemistry. By S. R. Church. Illustrated, 7 pp., Municipal Engineering, May. 25 cts.

SEWERAGE AND SANITATION

Sewer Construction at Regina, Saskatchewan, Can. Paper before American Society of Engineering Contractors. By W. R. Harris. Illustrated, 3 pp., Canadian Engineer, April 13. 15 cts. Illustrated, 3 pp., Cement, March. 25 cts.

Sewer Construction in St. Louis. Large brick and concrete sewers in tunnel through rock and sand and in open cut; using shield and air pressure. Eight miles of sewer under internal pressure. Tumbling basin and tunnel. Illustrated, 5 1-2 pp., Municipal Journal, May 3. 25 cts.

Difficult Reconstruction of a Large Sewer in Washington. By A. E. Phillips. Illustrated, 1 2-3 pp., Engineering Record, April 15. 10 cts.

Intercepting Sewer and Sewage Pumping Station. Carrying large pipe sewers across creeks at hydraulic gradient; reinforced concrete pipe in tunnel; deep pump well. By Robert Hooke, city engineer, Chattanooga, Tenn. Illustrated, 6 pp., Municipal Journal, May 3. 25 cts.

Thirty-Eighth Street Sewer, Minneapolis. Illustrated, 1 1-2 pp., Engineering Record, April 8. 10 cts.

For Better Sewerage Construction. 3-4 p., Municipal Journal, May 3. 25 cts.

Municipal Health-Disease Politic. Pre-sumption versus scientific conclusion. By W. S. Rankin. 6 pp., Bulletin North Carolina Board of Health, February.

Methods and Cost of Deep Trenching by Machine at Glencoe, Ill. By D. E. Marsh. Illustrated, 1 1-2 pp., Engineering-Contracting, April 5. 10 cts.

Flow of Storm Water in Sewers, Maximum. Paper before Institute of Civil Engineers of Ireland. By P. H. McCarthy. 5 pp., Canadian Engineer, April 6. 15 cts.

Statistics of American Cities, Sewerage Reports for 1910 from sixty large cities. Sewerage systems, pumping and purifying; sewer assessments. 13 pp., Municipal Journal, May 3. 25 cts.

Catch Basin Designs. Gratings and special forms of gutters; gratings or bars for curb openings; connection to sewer. Illustrated, 1 p., Municipal Journal, May 3. 25 cts.

Catch Basins in Newport. 1-1 p., Municipal Journal, May 3. 25 cts.

Sewer Gas Interceptor. 1 p., Surveying, April 21. 20 cts.

Deodorizing Sewer Gas. Illustrated, 1-1 p., Municipal Journal, May 3. 25 cts.

Sewer Pipe, Standard Tests of Drain Tile and. Paper before Iowa Engineering Society. By A. Marston and A. O. Anderson. 1 1-2 pp., Cement Age, April. 15 cts.

Standard Specifications for Tests of Drain Tile and Sewer Pipe. 1 p., Concrete, April. 15 cts. 2 1-2 pp., Clay Worker, April. 25 cts.

Concrete, Action of Sewage on. 3 pp., Cement Age, March. 15 cts.

Pumping in Great Britain, Electrical Sewage. By J. A. Seager. Illustrated, 4 pp., Engineering-Contracting, April 5. 10 cts.
Outlet, Underground Storm Sewer. 1-1 p., Municipal Journal, May 3. 25 cts.
Pollution, Acid Mine Drainage and. From annual report, Altoona, Pa., Board of Health. 1-2 p., Municipal Journal, April 12. 10 cts.

Sewage Disposal Experiments. Conducted in Philadelphia during past few years. Screening and sedimentation; contact; sprinkling and intermittent filters; sludge disposal. 2-1-2 pp., Municipal Journal, April 12. 10 cts.

Report on Philadelphia Sewage Purification Experiments. 1-3-4 pp., Engineering News, April 27. 15 cts.

Philadelphia Report on Sewage Disposal Investigations. 2-3 p., Engineering Record, April 8. 10 cts.

Methods and Results of Sewage Purification Experiments, Philadelphia, Pa. 2-1-2 pp., Engineering-Contracting, April 19. 10 cts.

Methods and Results of Sewage Sludge Studies, Philadelphia, Pa. 1-1-2 pp., Engineering-Contracting, April 26. 10 cts.

Philadelphia Sewage Disposal Experiments. 1-3 p., Municipal Journal, April 12. 10 cts.

Sewage Clarification. Fine mesh screen lessens sludge and scum; effect of time; baffles and scum boards in sedimentation. Philadelphia experiments. Illustrated, 1-1-4 pp., Municipal Journal, April 19. 10 cts.

Sprinkling Filter Experiments, Philadelphia Experiment Station. Various kinds and sizes of media; growths on and in filter beds; effect of ventilation; clogging and unloading; hypochlorite as cure for clogging. Illustrated, 3 pp., Municipal Journal, May 3. 25 cts.

Sewage Disposal with Respect to Offensive Odors. Paper before Congress of Technology. By G. W. Fuller. 3 pp., Engineering Record, April 15. 10 cts. 2 pp., Engineering News, April 20. 15 cts. 5 pp., Municipal Engineering, May. 25 cts.

Question of Sewage Disposal. Paper before League of California Municipalities. By N. G. Baker. 4 pp., Pacific Municipalities, March. 20 cts.

Purification of Sewage. By M. A. Puech. Illustrated, 11 pp., La Technique Sanitaire, April. 50 cts.

Darfield Sewage Disposal Works. Illustrated, 1 p., Contract Journal, April 5. 20 cts.

Massachusetts Experiment Station. 1-4 p., Municipal Journal, April 19. 10 cts.

Results of the Electrolytic Process of Sewage Purification at Santa Monica, Cal. 1-1-2 pp., Engineering-Contracting, April 19. 10 cts.

Operation of the Reading Sewage Disposal Plant. Illustrated, 1-2 p., Engineering Record, April 22. 10 cts.

Rise and Progress of Aerobic Methods of Sewage Disposal. Paper before Association of Managers of Sewage Disposal Works. By W. J. Dibdin. 1-2 p., Surveyor, March 31. 40 cts.

Creek Improvement, Squaw. Rectifying the stream in Lawton, Okla. Open conduit lined with reinforced concrete; forms, expansion joints, in railing, bridges at street crossings. By Z. M. Seifres, city engineer. Illustrated, 2 pp., Municipal Journal, April 26. 10 cts. Illustrated, 2-1-2 pp., Municipal Engineering, May. 25 cts.

Health Boards, Functions of. Non-sanitary duties imposed upon them. Garbage disposal and plumbing inspection. 1-2 p., Municipal Journal, May 3. 25 cts.

Board of Health Records. 1-4 p., Municipal Journal, May 3. 25 cts.

Association of Georgia Health Boards. 1-4 p., Municipal Journal, May 3. 25 cts.

Public Health, Technology and the. By C. E. A. Winslow. 5 pp., Advance New England, April. 10 cts.

Profitable and Fruitless Lines of Endeavor in Public Health Work. Paper before Congress of Technology. By E. O. Jordan. 1-2-3 pp., Engineering Record, April 22. 10 cts.

Recent Advances in Sanitary Engineering. By N. D. Baker. 4 pp., Bulletin, North Carolina Board of Health, February.

Ordinances, Rules and Regulations Pertaining to Public Health, Municipal. 4 pp., Public Health Reports, April 7; 5 pp., April 14; 5 pp., April 21. 10 cts.

Dust, Prevention of Disease by the Elimination of. By F. L. Hoffman. 4 pp., American City, May. 10 cts.

Typhoid Fever at Lexington, Va., Epidemic of. Caused by leaks from sewer to water mains. By A. W. Freeman and Richard Messer. Illustrated, 1-1-2 pp., Engineering News, April 27. 15 cts.

Squirrels in California, Campaign Against Plague Infected. Illustrated, 5 pp., Public Health Reports, April 21. 10 cts.

Tuberculosis, Town and Its Relation to. 1 pp., Bulletin, North Carolina Board of Health, February.

Bacillus Carriers, How Shall We Guard Against. By H. E. Welch. 1 pp., Bulletin, Ohio State Board of Health, March.
Disinfecting Swimming Pools. Experiments and use of chloride of lime; danger of infection removed; economic advantages. By Melville C. Whipple. 1-1-2 pp., Municipal Journal, April 26. 10 cts.

WATER SUPPLY

Wells, Determining Yield of. Law of flow of ground water into wells; methods of making an actual test and results obtained. Paper before Illinois Water Supply Association. By A. N. Talbot. Illustrated, 1-1-2 pp., Municipal Journal, April 26. 10 cts.

Deep Drill Work in Nova Scotia. 2 pp., Canadian Engineer, April 6. 15 cts.

Reservoir, Progress on the Ashoken, New York Water Supply. Illustrated, 1-1-2 pp., Engineering Record, April 15. 10 cts.

Effects of Storage Reservoirs Upon Water Powers. By A. H. Perkins. Illustrated, 1-1-3 pp., Engineering Record, April 15. 10 cts.

Experiments in the Storage of River Water. Paper before Royal Institute of Public Health. By J. R. Currie. 8 pp., Journal, April. 60 cts.

Design of Reservoir Dams. Paper before Institute of Civil Engineers of Ireland. By F. C. Uren. Illustrated, 4-1-2 pp., Canadian Engineer, April 6. 15 cts.

Spillway, The. By C. A. Mees. Illustrated, 5 pp., Engineering Record, April 22. 10 cts.

Weirs on Porous Foundations and with Pervious Floors. By W. G. Blight. Illustrated, 1-1-2 pp., Engineering News, April 13. 15 cts.

Intake, Corrugated Iron Culvert Pipe Used for a Water Supply. Illustrated, 2-3 p., Engineering-Contracting, April 12. 10 cts.

The Relation of the Intake to Pure Water from the Great Lakes. Relative cost of long intakes, compared with purified supplies from short intakes. Paper before Illinois Water Supply Association. By C. B. Burdick. 1-2-3 pp., Engineering-Contracting, April 19. 10 cts.

Conduits, Material for Water. 1-3 p., Municipal Journal, April 12. 10 cts.

Steel Pipe for Water Main. 1-4 p., Municipal Journal, April 26. 10 cts.

Steel Pipes for Water Works. Paper before New England Water Works Association. By E. Kuichling. 5 pp., Canadian Engineer, April 13. 15 cts. 3-1-2 pp., April 20. 15 cts.

Rust in Service Pipes. 1-1 p., Municipal Journal, April 26. 10 cts.

Wooden Insulation Joints for Water Mains. By J. A. McKenna. Illustrated, 1-1-2 pp., Engineering Record, April 8. 10 cts.

Aqueduct Construction at the Ashoken Reservoir. Illustrated, 1-1-3 pp., Engineering Record, April 22. 10 cts.

Methods of Sinking a Wet Shaft on the Rondout Pressure Tunnel of the Catskill Aqueduct. From paper by J. P. Hogan before American Society of Civil Engineers. 5 pp., Engineering-Contracting, April 12. 10 cts. 1-1-3 pp., Engineering Record, April 8. 10 cts.

Shaft Sinking in Water Bearing Fissured Rock by Grouting the Fissures. 1 p., Engineering-Contracting, April 12. 10 cts.

Siphon, Foundry Brook Steel, Catskill Aqueduct Illustrated. 2 pp., Engineering Record, April 15. 10 cts.

Siphon Soilways in Europe. By Adolph Ludin. Illustrated, 2 pp., Engineering News April 20. 15 cts.

Methods Used in Obtaining Concrete of Maximum Density for the Westley Standpipe. Paper before Boston Society of Civil Engineers. By A. B. McMillan. 1-1-2 pp., Canadian Engineer, April 6. 15 cts.

Corrosion of Iron and Steel Pipes. By A. S. Cushman, F. N. Speller and M. J. Falkenburg. 1 p., Engineering News, April 27. 15 cts.

Standpipe, Reinforced Concrete, U. S. Naval Station, Key West. Illustrated, 1-2 p., Engineering News, April 27. 15 cts.

Specifications for Reinforced Concrete Water Tanks. From report to American Railway Engineering and Maintenance of Way Association. Illustrated, 1-1-2 pp., Engineering-Contracting, April 12. 10 cts.

Flow of Water in Clean Iron Pipes. By A. E. Guy. 3 pp., Power, April 4. 5 cts.

Water-Finders, Experiments with. Paper before Royal Society of Arts. By J. Wertheimer. Illustrated, 2-1-2 pp., Canadian Engineer, April 6. 15 cts.

Rural Water Supply, Depletion and Pollution of. By H. Lemmon-Cannon. 2-1-2 pp., Surveying, April 21. 20 cts.

Conservancy, Administrative Aspect of Water. Paper before Society of Engineers. By W. R. B. Wiseman. 3-1-2 pp., Surveyor, April 7. 40 cts. Illustrated, 4 pp., Surveying, April 7. 20 cts. 1-1-2 pp., Contract Journal, April 19. 20 cts.

Clean Water as a Municipal Asset. Paper before Central States Water Works Association. By G. C. Whipple. 4 pp., American City, April. 10 cts. 2-1-2 pp., Surveying, April 21. 20 cts.

Water Purification at Wilmington. Report of work done by new filtration plant; sponge filters for preliminary clarification; defective rate controlling device lowers efficiency; low cost of operation; sand cleaning machines. Illustrated, 1-2-3 pp., Municipal Journal, April 19. 10 cts.

Modern Methods of Purification of Public Water Supply. 3 pp., Canadian Engineer, April 27. 15 cts.

Portsmouth Water Works. New filter beds and covered reservoirs. Illustrated, 1 p., Surveyor, April 14. 40 cts.

Legislation Against Rapid Filtration. 1-3 p., Municipal Journal, April 19. 10 cts.

Ozone Plant at St. Petersburg, Russia. 1-3 p., Engineering Record, April 29. 10 cts.

Hypochlorite for Destroying Growth of Algae and Diatoms. By J. W. Ellms. 1-1-2 pp., Engineering Record, April 8. 10 cts.

Effect of Bleaching Powder upon Bacterial Life in Water. By J. W. Ellms. 2 pp., Engineering Record, April 29. 10 cts.

Operating Difficulties in the Hypochlorite Treatment. Illustrated, 1 p., Engineering Record, April 15. 10 cts.

Portable Emergency Hypochlorite Plant. Illustrated, 1-2 p., Engineering Record, April 22. 10 cts.

Disinfection of Water. By R. G. Perkins. 6 pp., Bulletin, Ohio State Board of Health, March.

Bacteriological Examination of Water, Properties of Some Culture Media Used in the. By J. F. Liverseege. 2 pp., Surveying, April 7. 20 cts.

Waste and Public Water Consumption. 1-3 p., Municipal Journal, April 26. 10 cts.

Depreciation in Water Works. By Leonard Metcalf. 2-1-2 pp., Public Service, April. 25 cts.

Delinquent Consumer, Town as a. 1-4 p., Municipal Journal, April 19. 10 cts.

Costs, Methods of Keeping, by the Engineers of the Pittsburg Filtration Work. 3-1-2 pp., Engineering-Contracting, April 12. 10 cts.

STREET LIGHTING AND POWER PLANTS

Street Lighting Investigation, Worcester. 2-3 p., Engineering Record, April 29. 10 cts.

Electric Street Lighting. By Albert Scheible. Illustrated, 1-1-2 pp., Electrical Review, April 22. 10 cts. 1-1-2 pp., April 15. 10 cts. 1-2-3 pp., April 8. 10 cts.

Public Gain from Improved Efficiency of Electric Lighting. By W. H. Blood, Jr. 4 pp., Municipal Engineering, May. 25 cts.

Gas Arc Street Lighting. Paper before New England Association of Gas Engineers. Illustrated, 1 p., American Gas Light Journal, April 24. 10 cts.

Decorative Public Lighting Grows in Public Favor. Illustrated, 11 pp., Illuminating Engineer, April. 20 cts.

Park Lighting. By E. L. Elliott. 4 pp., American City, April. 10 cts.

Lamps, New Metallic Filament. By G. S. Merrill. Illustrated, 24 pp., Journal Franklin Institute, April. 50 cts.

Electric Plant, Wallingford Municipal. 1-4 p., Municipal Journal, April 12. 10 cts.

Hygienic Aspects of Illumination and Recent Progress in Illuminating Engineering. Paper before Institute of Sanitary Engineers. By Leon Gaster. 2 pp., Surveyor, April 14. 40 cts.

FIRE DEPARTMENT

Fire Prevention as a Municipal Function. By R. Waldo. Commissioner New York Fire Department. 1-1-2 pp., Survey, April 8. 10 cts.

Fire Department, Sketch of Hartford. Illustrated, 1 p., Fireman's Herald, April 8. 5 cts.

Oklahoma City's Fire System. Illustrated, 3-4 p., Municipal Journal, April 19. 10 cts.

High Pressure, Philadelphia. By J. E. Codman. 2-1-2 pp., Insurance Engineering, March. 25 cts.

Fire Risks, Hamburg and Its. Illustrated, 2 pp., Fireman's Herald, April 15. 5 cts.

Boston's Fire Dangers. High pressure system recommended. 4 pp., Insurance Engineering, March. 25 cts.

New York City's Fires. Work of public department. 7 pp., Insurance Engineering, March. 25 cts.

Asch Building Disaster Investigation. 1 p., Fireman's Herald, April 22. 5 cts.

Report on the Asch Building Fire, New York. Illustrated, 1-1-3 pp., Engineering Record, April 15. 10 cts.

Fire Underwriter's Report on the Asch Building Fire. Illustrated, 1-2-3 pp., Engineering News, April 13. 15 cts.

Smoke Worse Than Fire. By H. M. Wilson. 3 pp., American City, May. 10 cts.

GOVERNMENT AND FINANCE

Public Service Commission, Work for Engineers in Connection with, 2-3 p., Engineering News, April 27, 15 cts.

Public Service Corporations and Politics, By E. N. Wrightington, 3 pp., Public Service, April, 25 cts.

Relations of a Public Utility Company to the Public, By S. Murdock, Paper before Indiana Gas Association, 1 1-2 pp., American Gas Light Journal, April 10, 10 cts.

Valuations of Public Service Properties, By H. P. Gillette, 2 pp., Public Service, April, 25 cts.

Primaries in Chicago, People's, 3 pp., Review of Reviews, April, 25 cts.

Outlying Districts, City's Control of, By J. H. Gundlach, 3 pp., American City, May, 10 cts.

Excess Condemnation and Public Use, By A. W. Crawford, 1 2-3 pp., Real Estate News, April, 25 cts.

Information Bureau, City, 1-3 p., Municipal Journal, April 26, 10 cts.

Budget, Importance of the Municipal, as a Means for the Control of Expenditures, By Anson Herrick, 5 pp., Journal of Accountancy, April, 25 cts.

Accounting, Ideal Municipal, Paper before League of California Municipalities, By Wm. Dolge, 4 pp., Pacific Municipalities, March, 20 cts.

Work of the Merriam Commission in Chicago, 1 1-2 pp., Engineering-Contracting, April 5, 10 cts.

Slow Pay, New York City, 1-4 p., Municipal Journal, April 19, 10 cts.

STREET CLEANING AND REFUSE DISPOSAL

Street Cleaning Machine for Removing Sweepings from Gutters, 1-4 p., Municipal Journal, April 19, 10 cts.

Street Dust and Street Cleaning in Relation to Health, Comfort and Economy, By J. H. Landis, 5 pp., Bulletin, Ohio State Board of Health, March.

Fuel Briquets from Street Rubbish, Practice at St. Ouen, France, Southwark, England, and Amsterdam, Holland, 1-3 p., Municipal Journal, April 12, 10 cts.

Energy from Municipal Waste, Technology of Combustion and the Production of, By Frederick Meyer, 3 1-2 pp., La Technique Sanitaire, April, 50 cts.

Ashes, Removal of Domestic, at Rochester, 1-3 p., Municipal Journal, April 19, 10 cts.

Garbage Disposal, Control of, 1-2 p., Municipal Journal, May 3, 25 cts.

Value of New York's Garbage, Method of treating it; amount handled; costs and prices paid, 1 p., Municipal Journal, May 3, 25 cts.

TRAFFIC AND

TRANSPORTATION

Transportation Problem of Greater Cleveland, Paper before Cleveland Engineering Society, By A. B. Dupont, Illustrated, 2 1-2 pp., Canadian Engineer, April 20, 15 cts.

West Side Freight Traffic Problem in New York City, Illustrated, 2 1-2 pp., Engineering News, April 13, 15 cts.

London Traffic, By H. R. Wilson, 1 1-2 pp., Engineering News, April 13, 15 cts.

Plan for Elimination of West Side Surface Tracks, New York City, Illustrated, 2 1-2 pp., Engineering-Contracting, April 26, 10 cts.

Subway Construction in New York City, By D. J. Hauer, Illustrated, 3 pp., Contractor, April 15, 15 cts.

Methods of Constructing and Sinking the Steel Tubes for the Traction Tunnel at La Salle Street, Chicago, Illustrated, 4 pp., Engineering-Contracting, April 5, 10 cts.

Proposed Shuttle System of Subways for Chicago, Illustrated, 1 p., Engineering News, April 20, 15 cts.

Trolley Transit, Trackless, By C. O. Burge, 1 p., Engineering Record, April 29, 10 cts.

Drilling, Novel Method of Diamond, Using Cement Grout Instead of Steel Casing, Illustrated, 2 pp., Engineering-Contracting, April 26, 10 cts.

Paint, Rust Proof Slag, By E. C. E. Lord, 1-3 p., Engineering Record, April 29, 10 cts.

Cost Keeping System, Some Notes on, 1 1-2 pp., Contractor, April 15, 15 cts.

Civil Engineers, Licensing of, Bill introduced in the Alabama Legislature, 9 pp., Proceedings Engineering Association of the South, March, 50 cts. Resolution adopted by the Board of Direction of the American Society of Civil Engineers, 11 pp., Proceedings Engineering Association of the South, March, 50 cts.

Engineering School Graduate; His Strength and His Weakness, Paper before Congress of Technology, By H. P. Talbot, 2-4 p., Engineering News, April 20, 15 cts. Massachusetts Institute of Technology, 1-4 p., Municipal Journal, April 19, 10 cts.

BOOK REVIEW

Municipal Chemistry. A series of thirty lectures by experts on the application of the principles of chemistry to the city, delivered at the College of the City of New York, 1910. Edited by Charles Baskerville. McGraw-Hill Book Company, New York, 1911. Cloth, 6½ by 9½, 526 pp. Price, \$5.

The thirty lectures comprising the chapters of this work were open to the public as well as to students, the latter doing laboratory work in connection with them, hence are somewhat popular in their nature. They are extremely interesting to the student of city affairs, and he need not be deterred from reading them through lack of knowledge of any but elementary chemical principles. The science of municipal chemistry, as defined by this work, involves chemical work, but deals largely with engineering matters. An introductory lecture by the Editor explains how the growth of cities and the consequent density of population have brought about the new problems, which are explained in the later lectures. The importance of pure water supply is indicated by the choice of drinking water and disease as the first topic for discussion. The water supply of New York is described and methods of purification in use elsewhere. The milk question is discussed by T. C. Darlington, ex-Commissioner of Health, New York. Lectures on pure food and food adulteration naturally follow. The adulteration of drugs, methods of detecting it and drug-forming agents are given in three chapters.

Showing the wide scope of the work, comes the subject of streets, prevailing forms of pavement construction being described. This leads up to the discussion of street sanitation, street cleaning and the various methods of disposing of garbage. The topics treated in the rest of the book have less connection with each other. They are: Sewage disposal, illuminating gas, smoke, ventilation, personal hygiene, textile materials, combustibles and explosives, paint, corrosion of iron and steel, cement and concrete, parks, gardens and playgrounds. As nearly all of the lecturers were men connected in some way with the New York City government, the book is a fairly complete account of the practices in that city. The book should be a valuable one for the members of boards of health and other city officials.

THE WEEK'S CONTRACT NEWS

Relating to Municipal and Public Work—Street Improvements—Paving, Road Making, Cleaning and Sprinkling—Sewerage, Water Supply and Public Lighting—Fire Equipment and Supplies—Bridges and Concrete Work—Sanitation, Garbage and Waste Disposal—Police, Parks and Miscellaneous—Proposals and Awards.

To be of value this matter must be printed in the number immediately following its receipt, which makes it impossible for us to verify it all. Our sources of information are believed to be reliable, but we cannot guarantee the correctness of all items. Parties in charge of proposed work are requested to send us information concerning it as early as possible; also corrections of any errors discovered.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Pennsylvania	Altoona	May 12, 3 p.m.	Constr. about 85,000 sq. yds. street asphalt, asphalt block and brick paving.	W. M. C. Craine, Pres. B. P. Wks.
Florida	Jacksonville	May 12, 2:30 p.m.	Grading, curbing and paving with vitrified blocks of some standard brand various streets.	Philip Prioleau, City Engr. Joint Board Commissioners.
Indiana	Rushville	May 13	Constructing gravel road 36,830 ft. long.	C. W. Shoemaker, Sec'y Comrs.
Ohio	Fort Meigs	May 13, 2 p.m.	Constr. tar macadam roadway and constr. concrete sidewalks.	O. F. Graves, City Clk.
Iowa	Harlan	May 15, 8 p.m.	Constructing about 7,000 lin. ft. of concrete curb and gutter; 15,000 sq. yds. concrete pavement.	H. Chatfield, City Clerk.
Kentucky	Catlettsburg	May 15, 6 p.m.	Improving portions of various streets, including 14,555 lin. ft. curb and gutter and 20,305 sq. yds. paving.	John J. Monaghan, City Clerk.
New York	Lackawanna	May 15, 8 p.m.	Paving with vitrified brick portion of Ridge Road.	City Clerk.
California	Lodi	May 15	Macadamizing streets, cost of work about \$42,432.65.	Chas. J. Duff, City Clerk.
Iowa	Council Bluffs	May 15, 5 p.m.	Constructing about 1,611 lin. ft. combination curb and gutter, concrete 6 inches thick.	Morgan R. Butler, City Engr.
North Dakota	Carrington	May 15	Grading roads for year 1911.	James V. Mahony, Secy. Bd. C. & S.
Michigan	Port Hope	May 15, noon	Constructing 5 lin. miles concrete sidewalks and crossings.	J. W. Sanders, Town Clerk.
Wisconsin	Waukesha	May 15	Constr. about 4,620 sq. yds. asphalt macadam pavement; 270 sq. yds. brick gutters; 170 lin. ft. storm sewers; 4,796 lin. ft. concrete curb and gutter.	A. J. McKenzie, City Engr.
New York	Yonkers	May 15, 3:30 p.m.	Regulating, grad. and otherwise improv. various streets.	C. L. Miller, City Clerk.
Missouri	Webb City	May 15, 5 p.m.	Constr. 8,865 sq. ft. concrete sidewalk; 4,556 lin. ft. concrete combined curb and gutter; 2,500 sq. yds. brick block pavement; 11,744 sq. yds. asphalt macadam pavement.	I. H. Daniels, Village Clerk.
Michigan	Kalamazoo	May 15	Constr. 9,100 sq. yds. brick pavement on 6-in. concrete.	W. W. Caldwell, Commissioner.
Ohio	Greenwich	May 16	Excavating about 3,435 cu. yds., paving 11,709 sq. yds. water-bound macadam.	Roger G. McGrath, Secy. B. P. Wks.
Pennsylvania	Harrisburg	May 16, noon	Paving various streets with sheet asphalt or vitrified brick; cost of work about \$80,400.	Jacob L. Bauer, County Engr.
Kentucky	Louisville	May 16, 2 p.m.	Improving portion of Fulton street & pav. with granite block.	Geo. C. Love, Comr. Dept. Sts
New Jersey	Elizabeth	May 16, 3:30 p.m.	Constructing 27,594 sq. yds. asphalt concrete, macadam or bitulithic pavements, 3,230 lin. ft. concrete retaining slab, and 600 tons crushed stone.	Francis G. Ward, Commissioner.
Tennessee	Memphis	May 16	Constructing 5.1 mi. gravel paving, 3.9 mi. tar macadam, 1.4 vitrified brick, 2.9 wood block or bit. and 1/2 mi. old stone.	Fred Cary, City Clerk.
Ohio	Columbus	May 17	Grading and macadamizing various roads in Franklin County.	H. W. Becker, Clk. Bd. Pub. Wks.
New York	Buffalo	May 17, 11 a.m.	Paving and repaving various streets and alleys.	Stanley Struble, Pres. Co. Comrs.
Minnesota	Little Falls	May 17, 8 p.m.	Paving with crosstred wood blocks the Boardway wagon bridge over Mississippi river.	Joshua C. Haines, Chm. Police Com.
Indiana	Ft. Wayne	May 18, 7:30 p.m.	Constr. cement sidw. in 14 sts.; and paving various streets.	Robt. W. Craig, Secy. Bd. Control.
Ohio	Cincinnati	May 19, noon	Constr. Compton rd. in Hamilton Co.; mac. exten. of Strubler rd.	H. B. R. Craig, City Engineer.
New Jersey	Camden	May 19, 8 p.m.	Constructing cement sidewalks and driveways.	A. P. Tripp, Town Clerk.
Arizona	Phoenix	May 20	Constr. territorial road from Tucson to Bisbee.	John F. Goldenbogen, Clk. B. C. C.
Ontario, Can.	Kingston	May 20, noon	Constructing 6,160 sq. yds. pavement; 2,276 lin. ft. curb and gut.	C. W. Handman, Business Manager.
New York	Chatham	May 20	Constructing a section of highway known as Rowe Hill.	J. S. Hanlon, City Clerk.
Ohio	Cleveland	May 20, 11 a.m.	Grading, draining and improving portion of Settlement Road.	F. W. Tean, County Auditor.
Ohio	New Philadelphia	May 22	Paving the New Cumberland Road with brick.	Budroe, Sec'y Bd. Pub. Service.
Ohio	Cincinnati	May 22, noon	Grade, cement park lot surrounding Public School.	The George Company, Ran. Bldg. Memphis, Tenn.
New York	Auburn	May 23	Constructing subways in portion of Washington street and paving same with vitrified brick.	A. G. Fisher, County Auditor.
Ohio	Bowling Green	May 23, 1 p.m.	Grading, draining and macadamizing county road.	
Ohio	Dayton	May 24, noon	Paving 16 streets and 2 alleys.	
Mississippi	Hazlehurst	June 1	Constructing 58 miles of gravel roads in Copiah County.	
Indiana	Monticello	June 7, noon	Construct. a rock road on County line bet. White & Carrol Cos.	
SEWERAGE				
N. B. Can.	St. John	May 12	Furn. vit. salt glazed sewer pipe for the village of Fairville.	Gilbert C. Murdoch, County Engr.
Alabama	Auburn	May 13, 8 p.m.	Constructing about 7,423 ft. 8-in. sanitary sewers.	J. W. Wright, Mayor.
New York	Batavia	May 13, 10 a.m.	Constructing sewage disposal plant.	K. B. Mathes, Chm. Bd. Sew. Com.
Oregon	The Dalles	May 13	Construct. a section of Dist. No. 1 sewer system, cost about \$225,000.	L. T. Boyle, City Engineer.
South Dakota	Aberdeen	May 15, 8 p.m.	Construct. 1,860 ft. of 8 and 12-in. pipe sewers.	F. W. Raymond, City Auditor.
Nebraska	South Auburn	May 15, 6 p.m.	Constructing about 1,400 ft. of 8-in. sewer.	City Clerk.
Indiana	Auburn	May 15, 7:30 p.m.	Constructing about 10,000 ft. of from 20-in. vitrified to 42-in. concrete storm sewer.	E. O. Little, City Clk.
Ohio	Xenia	May 15	Constructing sanitary sewer system on the new Greene Co. Children's Home grounds.	Walter L. Dean, County Aud.
Alta. Can.	Edmonton	May 15, 3 p.m.	Constructing in tunnel a concrete sewer 10 ft. 6 in. in internal diameter and about 3,290 ft. long.	A. J. Latonell, City Engineer.
New York	Fulton	May 15, 9 a.m.	Construct. 8,500 ft. of 8-in. vitrified pipe sewer; 900 ft. 10-in., 4,500 ft. 7.6-in., 20 manholes, 14 flush tanks, 400 Y branches.	Board of Public Works.
Ontario, Can.	N. Toronto	May 15, 6 p.m.	Constructing main sanitary sewer pipes, manholes, etc., in various streets.	A. J. Brown, Mayor.
Virginia	Norfolk	May 16, 12:30 p.m.	Installing 3 electrically driven sewer pumps, including electric apparatus, switchboard, etc.	W. T. Brooker, City Engr.
Wisconsin	Reedsburg	May 17	Constr. 3,000 lin. ft. of 18 and 30-in. trunk sewers.	A. H. Huebig, City Clerk.
Wisconsin	Antigo	May 17, 2 p.m.	Constr. 11,537 ft. of 10, 18, 20 and 24-in. pipe sewer and dis. plt.	G. O. Palmieri, City Clerk.
Wisconsin	Baraboo	May 17	Constructing trunk sewers, 3,000 lin. ft. 30 and 27-in. pipe.	A. H. Huebig, City Clerk.
New Mexico	East Las Vegas	May 17, 4 p.m.	Constr. 19,750 lin. ft. 8-in. vitrified sewer; 3,350 lin. ft. 10-in. and 100 lin. ft. 15-in.; 50 manholes; 12 single flush tanks com.	Chas. Tammie, City Clerk.
Ohio	F. Youngstown	May 22, noon	Constructing sanitary sewer.	J. P. Carney, Village Clerk.
Oklahoma	Muskogee	May 23	Constr. 21,200 ft. of 48-in. sewer pipe; 6,500 of 45-in. and 7,100 of 42-in. Alternate bids for two ring brick with vitrified invert and manufactured concrete pipe.	City Clerk.
Ohio	Amherst	May 23	Constr. a small sewer system and sewage disposal plant.	C. G. Aschenbach, City Clerk.
Maryland	Frederick	May 24	Constr. about 4,000 lin. ft. 6-in. to 42-in. sewers with inlets, m.h.	J. Edward Schell, Mayor.
Pennsylvania	Williamsport	May 24	Constructing storm water sewers in various streets.	J. J. Galbraith, City Clerk.
New York	Binghamton	May 24	Constructing sanitary sewers in various streets, about \$15,000.	Board of Contract and Supply.
Ohio	Dayton	May 24, noon	Constructing sanitary and storm sewers in various streets.	J. C. Ely, Dir. Pub. Service.
Kansas	Leavenworth	May 31, noon	Constructing main storm water drain in the college section.	Capt. John S. Winn, Act. Q., U.S.A.
New York	S. Glens Falls	June 1	Constructing a sewer system and disposal plant.	C. W. Skym, Village Clerk.
New York	Fort Hamilton	June 2, 11 a.m.	Constructing a sanitary sewer.	Constructing Quartermaster.
California	San Jose	July 3	Construct septic tank for County hospital.	City Clerk.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
WATER SUPPLY				
Ohio	Rockport	May 12	Constructing water mains.	F. Feuchter, Clerk.
Iowa	Sioux City	May 13, 10 a.m.	Furnishing valves and hydrants.	G. B. Healy, Supt. P. & P. Prop.
Massachusetts	Holyoke	May 15, noon	Constr. a conc. dam across Manli. Brook in Southampton	Water Commissioners
Massachusetts	Pittsfield	May 15, 2 p.m.	Laying water pipes.	Board Public Works
Iowa	Tipton	May 15, 7:30 p.m.	Drilling an artesian well.	C. H. Foy, City Clerk
New York	New York	May 16, 11 a.m.	Construct. portions of the city tunnel of the Catskill aqueduct.	Chas. Strauss, Pres. Bd. W. Sup.
Minnesota	Eveleth	May 16	Furn. 12,500,000 gal. capacity, high duty pumping engine of the crank and flywheel type.	D. P. McIntyre, City Clerk.
California	Fort Mason	May 17, 11 a.m.	Constr. a 6,000,000-gal. reinforced concrete reservoir.	Col. Geo. McK. Williamson, Con. Q. M.
Michigan	Marquette	May 20	Building 2 concrete dams on Dead river and other improvements to the hydroelectric plant. Cost about \$100,000.	Chas. Retaille, Supt. L. & P. Com
Ohio	Silverton	May 22	Laying a 6-in. water main in portions of several streets.	A. A. Sprague, Village Clerk.
Minnesota	N. Mankato	May 22, 7:30 p.m.	Constructing a water works system. Alternate bids on electric pumping equipment and gasoline. Separate bids on reservoirs, pump house, pumping equipment, water mains and well.	L. Donohue, Village Clerk.
California	San Diego	May 22	Furn. 8,536 lengths of 4 water pipe from 8 to 36-in.	P. E. Woods, Supt. Water Dept
Illinois	Stanford	May 22	Constructing water works system.	W. C. Murphy, Village Clerk
New York	New York	May 23, 11 a.m.	Completing the Hudson siphon.	Board Water Supply.
Wisconsin	La Crosse	May 23, 2 p.m.	Furn. c. 1 pipe, hydrants, valves, etc.	Board Public Works.
Virginia	Ft. Meyer	May 25, 11 a.m.	Constr. about 2 miles of 10-in. water mains.	Capt. Warren W. Whiteside, C. Q. M.
California	Los Angeles	May 26	Furn. fabricated steel and rivets necessary to con. abt. 1,865 ft. of 9-ft. 3-in. and 8,313 ft. of 11-ft. riveted steel siphon.	Board of Public Works.
Ohio	Toledo	May 26, noon	Furn. rotary pump, 15,000,000 gals. daily; also bituminous coal gas producer and accessories, about 400 h.p. continuous capacity.	Fred Shane, Sec'y Bd. Pub. Service.
Ontario, Can.	Ottawa	May 29, 4 p.m.	Constr. a dam and spillway at Kipewa Village, Pon. Co., Quebec	R. C. Desrochers, Secy. D.P.W., Ott.
Brit. Col., Can.	Vancouver	May 31, 4 p.m.	Furn. steel pipe, 1 pipe; also 18-in. flexible joint c. i. pipe.	Wm. McQueen, City Clerk.
Wyoming	Ft. Yellowstone	May 31, noon	Constructing pipe line from Panther Creek to Ft. Yellowstone water system.	Constructing Quartermaster.
Ontario, Can.	Toronto	June 6	Furnishing vertically driven pumps.	C. H. Rust, City Engr.
BRIDGES				
New York	Richmondville	May 12, 1 p.m.	Construct. an iron, conc. arch, or stone bridge.	G. C. Shafter, Town Clerk.
Massachusetts	Barnstable	May 13	Constr. a reinforced concrete bridge over West Bay, 289 ft. long 20 ft. wide, with steel draw span.	F. C. Wales, Boston, Mass. Engr.
Ohio	Sidney	May 13, 10 a.m.	Constructing superstructure for one steel highway bridge, 75 ft. long, over Mosquito Creek.	H. T. Ruese, County Auditor.
Wisconsin	Milwaukee	May 15	Constr. the Oneida-Wells St. Bridge, cost about \$120,000.	L. J. Klug, Supt. of Bridges.
Ohio	Delaware	May 15, noon	Constr. east abutment of the Sunbury Pike bridge over Alum Creek in Berlin township.	W. H. Bodbetha, County Auditor.
Pennsylvania	West Chester	May 15, noon	Constr. a reinf. conc. bridge at Springdale station over Doe Crk	E. V. Phillips, Clk. Co. Comrs.
Ohio	Columbus	May 16, noon	Constr. the approaches and superstructure of the Wilson Bridge over Olentangy river.	F. M. Sayre, County Auditor.
Utah	Moab	May 20	Constructing a bridge over Grand river.	A. A. Neff, County Clerk.
Pennsylvania	Washington	May 22, 1:30 p.m.	Constructing four reinforced concrete bridges.	John H. Moffitt, Co. Comptroller.
Ohio	Lorain	May 22, 1 p.m.	Constr. substructure and superstructure of four bridges.	Chas. Chandler, Clk. Co. Comrs.
Ohio	Cincinnati	May 29, noon	Driving piling for the construction of substructure and miscellaneous work in connection with Gilbert ave. Viaduct.	John I. Wenner, Clk. Bd. Pub. Serv.
Pennsylvania	Pittsburg	June 1	Widening Smithfield Street Bridge, cost about \$150,000.	City Clerk.
New York	New York	June 1	Strengthening the end spans of the Williamsburg Bridge.	Kingsley L. Martin, Comr. of Br.
Pennsylvania	Pittsburg	July 1	Constructing one concrete arch, estimated cost \$85,000.	City Clerk.
LIGHTING AND POWER				
Manitoba, Can.	Winnipeg	May 15	Furn. and install. six 500 KW stepdown transformers for substation No. 1.	M. Peterson, Secy. Bd. Control.
Missouri	Columbus	May 16	Constructing an electric lighting and power plant.	John S. Bicknell, City Clerk.
California	Riverside	May 24	Franchise to run poles and line for conveying electric power on all roads of county.	County Supervisors.
FIRE EQUIPMENT				
Washington	Centralia	May 16, 5 p.m.	Furn. one combination chemical hose and ladder or chemical and hose, automobile.	W. H. Hodge, City Clerk.
California	Oakland	May 17, 11 a.m.	Furn. 3 combination chemical hose wagons; 3 third size steam fire engines; 1 motor driven pumping engine; 3 motor-driven combination chemical and hose wagons, and fire hose.	Jas. W. Nelson, Sec'y Bd. Pub. Wks.
Oregon	Astoria	May 27, 8 p.m.	Furn. 1,200 ft. 2 1/2" fire hose for Fire Dept.; 200 ft. for Street Dept.	C. E. Foster, Chief Fire Dept.
New Jersey	Princeton	July 5	Furn. auto pumping engine.	E. M. Updike, Chm. F. & W. Com.
MISCELLANEOUS				
New York	Albany	May 15, 3 p.m.	Installing police signal system.	Isidore Wachsman, Bd. Cont. & Sup.
New Jersey	Passaic	May 19, 8 p.m.	Install Police Signal, Fire Alarm and Mun. Tele. Exchange.	M. B. Matthews, Chm. Com. Pub. S.
Ohio	Mount Gilead	May 19, 11 a.m.	Furn. iron culvert pipe from 8 to 48-in. diameter.	Clinton Sipe, County Auditor.
California	Oakland	May 22, 10-11 a.m.	Constructing City Hall Building, separate bids on 27 items.	James W. Nelson, Secy. Bd. Pub. W.
Ohio	Youngstown	May 23, 11 a.m.	Renewing part of the floor of the Market St. Viaduct.	Will B. Jones, County Auditor.
Ontario, Can.	Toronto	May 23, noon	Building dock in Ashbridge Bay.	G. R. Geary, Mayor.
Indiana	Indianapolis	May 25	Removing garbage.	Chris Schrader, Chm. Bd. Pub. Wks.
Indiana	Evansville	June 1	Furnishing plans for building to be erected in Sunset Park.	Simon A. Bartholme, Clk. B. P. C.

STREET IMPROVEMENTS

Fort Smith, Ark.—Council is considering paving of Garrison ave.; creosote block paving is favored.

Fullerton, Cal.—Consulting Engineer D. S. Halladay, Central Bldg., Los Angeles, has prepared plans for 13 miles of oil macadam roadway; cost \$178,000.

Mulderry, Albany, for city \$2.17 to \$2.29, for railroad \$2.49 to \$2.60; Dennis Hester & Son, Hudson, for city \$2.34 to \$2.41, for railroad \$2.92 to \$3.20; Foley & Bannon, Kingston, for city \$2.10 to \$2.22, for railroad \$2.51 to \$2.61; Dollard & Heenan, Albany, for city \$2.15 to \$2.21, for railroad \$2.26 to \$2.32; Jersey Paving Corporation of Newark, for city \$2.30, for railroad \$2.75; price per lin. ft. for relaying curbing ranged from 15c. to 30c. per ft. for new curbing, 70c. to \$1.10.

Long Island City, L. I., N. Y.—Regulating, grading, curbing, recurling, reflagging and paving with asphalt block on concrete foundation in 2d ave., from Jackson ave. to Flushing ave., First Ward: (a) Barber Asphalt Co., 50 Church st., New York City, (b) Hastings Pavement Co., 25 Broad st., New York City: 2,000 cu. yds. earth excavation, (a) 99c., (b) 80c.; 2,600 lin. ft. old concrete curb reset, (a) 90c., (b) 35c.; 300 lin. ft. cement curb, (a) 95c., (b) \$1.10; 4,000 sq. ft. old flag relaid, (a) 11c., (b) \$5.80; 6,650 cu. yds. concrete, (a) \$1, (b) \$5.80; 39,800 sq. yds. asphalt block pavement, outside railroad area, (a) \$1.75, (b) \$1.75; 8,592 sq. yds. asphalt block pavement, within 920 sq. yds. asphalt block pavement, within railroad area, (a) \$1.75, (b) \$1.75; 1,500 cu. yds. concrete, within railroad area, \$6, (b) \$5.80; totals, (a) \$139,325, (b) \$125,690.

New York, N. Y.—Paving as follows: Repairing with wood block on concrete foundation southern blvd., E. 133d st., from 3d ave. to Alexander ave., U. S. Wood Preserving Co., lowest bidder, 3,200 sq. yds. completed wood block pavement and keeping same in repair for 5 years from date of acceptance, \$2.52; 1,820 sq. yds. completed wood block pavement, not to be kept in repair, \$2.52; 855 cu. yds. concrete, including mortar bed, \$5.10, and 1,810 lin. ft. new granite curb, furnished and set in concrete, \$1.23; total, \$21,757; total of other bids: Republic Construction Co., \$23,368; Mack Bros., \$22,921; Barber Asphalt Paving Co., \$22,775. Regulating, grading and paving with asphalt blocks on concrete foundation, E. 192d st., from Creston ave. to Kingsbridge road, set curb, etc., lowest bidder, Hastings Pavement Co., 1,375 cu. yds. earth excavation, 75c.; 550 cu. yds. rock excavation, \$2.75; 850 lin. ft. new curb, furnished and set in concrete, \$1; 105 lin. ft. old curbstone, reset in concrete, 35c.; 2,750 sq. ft. new flag, 28c.; 1,545 sq. yds. completed asphalt block pavement and keeping same in repair for 5 years, \$1.71; 225 cu. yds. concrete, including mortar bed, \$5.92; total, \$8,352; Barber Asphalt Co. bid for sheet asphalt and set curb, etc., lowest bidder, Barber Asphalt Pavement Co., 6,620 sq. yds. com-

pleted asphalt block pavement, and keeping the same in repair for 5 years from date of acceptance, \$1.65; 9,270 sq. yds. completed sheet asphalt pavement, and keep the same in repair for 5 years from date of acceptance, \$1.14; 2,705 cu. yds. concrete, including mortar bed, where required, \$5.50; 1,500 lin. ft. new curb, furnished and set in concrete, \$1c.; 7,900 lin. ft. old curb, rejoined, recut on top and reset in concrete, 32c.; total, \$49,199; the Hastings Pavement Co. bid for this work, \$44,163. Paving with granite block pavement on sand foundation, Canal pl., from E. 138th st. to E. 144th st., and setting curb, lowest bidder, Burnside Construction Co., 5,779 sq. yds. new granite block pavement on a sand foundation, laid with sand joints, and keeping same in repair for one year from date of acceptance, \$2.46; 500 lin. ft. new curb, furnished and set, 60c.; 2,880 lin. ft. old curb, reset, 25c.; 100 sq. ft. new bridgestone for crosswalks, furnished and laid, 65c.; 785 sq. ft. old bridgestone, rejoined and relaid, 8c.; total, \$15,342. Regulating, grading, setting curbs, etc., in Laychester ave., between Boston road and Pellam Bay Park, lowest bidder, W. J. Rodgers, as follows: 7,800 cu. yds. earth excavation, 20c.; 1,500 cu. yds. rock excavation, \$1.30; 205,000 cu. yds. fill, exclusive of material sinking below surface of marsh, 31c.; 16,000 lin. ft. new curb, 70c.; 61,200 sq. ft. new flag, furnished and laid, 23c.; 9,600 sq. ft. new bridgestone for crosswalks, 40c.; 1,900 cu. yds. dry rubble masonry, in retaining walls, culverts and gutters, \$1.75; 75 cu. yds. of rubble masonry, in mortar, \$3; 390 cu. yds. of Class "A" concrete, \$7; 250 lin. ft. vit. stoneware pipe, 12-in., \$2; 1,250 lin. ft. vit. stoneware pipe, 15-in., \$5; 230 lin. ft. vit. stoneware pipe, 18-in., \$4; 26 M. ft. lumber, furnished and laid, \$20; 10,200 lin. ft. new guard rail, 20c.; 8,100 lin. ft. of piles, 30c.; 26,000 lbs. of steel bars for reinforcing concrete, 3c.; 10 inlets, type "A," complete, \$50, and 6 inlets, type "B," complete, \$45; total, \$121,598. Regulating, grading, setting curb, etc., on other streets in Bronx, lowest bidders as follows: Westchester ave., from Main st. to Eastern blvd., Watson Contracting Co., \$61,578. White Plains ave., Morris Park ave. and Walker st., J. B. Malatesta, \$19,171; Findlay ave., from E. 164th st. to 165th st., W. McPherson, \$5,091, and Van Cortlandt ave., from Mosholu Parkway south to Jerome ave., J. Di Menna, \$4,739.

Dayton, O.—Grading and graveling 12 streets, low bidders were as follows: J. I. Geiger, for grading and graveling and setting curb on Gaines st., Dakota to Kammner ave., \$1,559; J. I. Geiger and Cliff Hoolihan, North Bend st., Casper to alley east of Hall st., \$522; Smith st., Cincinnati to western terminus, \$1,723.60; Greencastle st., Germantown st. to southern terminus, \$1,960; David A. Onkst, Benjamin st., from Wheatley st. to Darr ave., \$3,252.25; Santa Clara ave., Richmond ave. to Wheatley st., \$3,757.49; John F. Cooke, Findlay, from the C. I. & D. Railroad to canal feeder, \$5,378.75; Bayard st., from Perry to Longwood, \$1,033.50; Kirchlner & Co., Beth ave., Huston st. to Hydraulic race, \$1,691.50; bid received for grading and graveling of Highland ave., from St. Charles to Wyoming st., was above the Engineer's estimate; no bid was received for grading and graveling Calm st., between Hinstead ave. and Pontiac st.; two latter jobs will be re-advertised.

Butler, Pa.—Street improvements: Mercer st., from end of present paving to intersection of Maryland ave., N. J. Boyer, excavating, 30c.; Butler Brick and Tile Co. brick, \$1.12; F. E. McQuiston, excavating, 30c.; paving, \$1.12 to \$1.12; Tony Morelli, excavating, 15c.; paving, \$1.32 to \$1.45; East Penn st., Monroe to Oak, F. E. McQuiston, excavating, 40c.; paving, \$1.29 to \$1.51; N. J. Boyer, excavating, 30c.; paving, \$1.09 to \$1.31; Tony Morelli, excavating, 25c.; paving, \$1.07 to \$1.30; Mitchell ave., from Clay to Penn, F. E. McQuiston, excavating, 40c.; paving, \$1.21 to \$1.15; N. J. Boyer, excavating, 30c.; paving, \$1.10 to \$1.31; Tony Morelli, excavating, 25c.; paving, \$1.07 to \$1.30; Miller st., from Clay to Penn, F. E. McQuiston, excavating, 10c.; paving, \$1.21 to \$1.45; N. J. Boyer, excavating, 30c.; paving, \$1.10 to \$1.31; Tony Morelli, excavating, 25c.; paving, \$1.07 to \$1.30.

Galveston, Tex.—Roadway from western city limits at Broadway to the causeway: H. Freund, shell for paving, 13,400 cu. yds., \$1.61 per cu. yd.; soil for surfacing, 9,000 cu. yds., \$1.52 per cu. yd.; creosoted lumber for bulkheading, 60,000 ft., \$58.50 per M; all in place, on the same work and material Homson Sons bid \$1.61; on shell, \$1.51; for surfacing, \$59.50 for lumber, J. C. Kelso bid \$1.69 for shell, \$1.11 for surfacing, \$30 per M ft. for the lumber; Suderman & Dolson bid \$1.61 for shell, \$1.49 for surfacing and \$60 for lumber; Freund agrees to do the work in five months, Handson Sons by Oct. 1, Kelso by Sept. 30 and Suderman & Dolson by Dec. 1.

SEWERAGE

Oakland, Cal.—Council has adopted recommendation of Drainage and Sanitary Committee that City Engineer be directed to prepare plans and specifications for sewerage of 30th st., between Union and Peralta sts.

Riverside, Cal.—Cost of constructing Arlington trunk line sewer to the disposal works has been estimated at \$30,000.

San Francisco, Cal.—Board of City Supervisors has adopted ordinances for construction of sewers in Section L of North Point main sewer, cost not to exceed \$55,000.

San José, Cal.—Citizens will vote in June on \$100,000 bonds for sewers.

Marletta, Ga.—Citizens have voted \$15,000 bonds to complete sewer and water system.

Mountain Home, Ida.—Bids will soon be asked for installation of sewer system; bonds have been sold.

Aurora, Ill.—Bids will be received in about 40 days for construction of 9-in. to 30-in. pipe sewer and 42-in. to 48-in. concrete sewer; approximate cost, about \$120,000.—M. J. Tarble, City Engineer.

Park Ridge, Ill.—City will construct 7,000 ft. of 6-ft. concrete sewer; C. N. Roberts, C. E., 105 Clark st., Chicago, is preparing plans.

Fort Wayne, Ind.—The Metcalf and Eddy Engineering Co., Boston, has been retained to prepare plan for changing of city sewage system to admit of parking of river banks.

Rockport, Ind.—Council is considering plans and specifications for sewerage system for this city.

Valley Junction, Ia.—Bids will soon be received for construction of a sanitary sewer system and disposal plant; approximate cost about \$45,000.—Iowa Engineering Co., Clinton, Ia., Engineer; J. W. Mullane, City Clerk.

Lexington, Ky.—Improvement Committee has decided to construct sewers on West and East Short and Walnut sts.

Baltimore, Md.—Citizens have voted \$10,000,000 additional loan for sewers.

Princess Anne, Md.—Bids have been asked for construction of sewer system.

Cadillac, Mich.—City will install pumping apparatus to elevate sewage from lower sections of city to disposal plant.

Cold Spring, Minn.—City Engineer S. S. Chute, St. Cloud, is preparing plans for sewer system.

Paris, Mo.—Citizens have voted \$15,000 bonds for installation of sewerage system.

Elizabeth, N. J.—Council is considering construction of sewers in Mack and Pennington sts.

Trenton, N. J.—Council has passed ordinances for sewers in six streets.—H. B. Salter, City Clerk.

Canastota, N. Y.—Village Board is considering installation of 8-in. sewer.

Herkimer, N. Y.—Plans have been prepared for extension of sewerage system.

Port Chester, N. Y.—Village proposes to install sewage disposal plant, to cost \$100,000.—F. S. Odell, Engineer; Wm. C. Ling, Village Clerk.

Yorkville, N. Y.—Board of Trustees has purchased site for proposed sewage disposal plant.

Clayton, N. C.—Plans are being prepared by Gilbert C. White, Durham, for sewerage and water works.

Thomasville, N. C.—Town has decided to issue bonds for sewerage and water works.

Springfield, O.—City Engineer H. G. Horton has been instructed to prepare plans and specifications and estimates of cost of construction of Sewer District No. 25, Section No. 2.

Wadsworth, O.—Council has ordered City Engineer to ascertain cost of necessary enlargement of disposal plant.

Tulsa, Okla.—Citizens will soon vote on \$200,000 bonds for sewer extensions and construction.

Eugene, Ore.—Citizens will receive bids June 5 on \$28,000 sewer bonds.

Hillsboro, Ore.—Council has informally accepted plans by the City Engineer for proposed sewer and street work to cost about \$142,000.

Weatherly, Pa.—Plans have been prepared by Surveyor Moose and presented to Council for installation of sewer system at cost of \$13,000.

Burlington, Vt.—Street Commissioners will prepare plans for proposed sewer in Park ave.

Seattle, Wash.—All bids have been rejected for constructing Interbay District North trunk sewer for 138-in. circular concrete sewer, Grant Smith & Co., city, lowest bidder, at \$1,064,845, and for 138-in. concrete rectangular sewer, Erickson Construction Co., \$1,098,515; work includes 760 lin. ft. 12 or 15-in. pipe sewer, 153 lin. ft. 36-in. brick sewer, 186 lin. ft. 48-in. concrete sewer, 920 lin. ft. 48-in. c. l. sewer, including outlet; 151 lin. ft. 108-in. concrete sewer, 1,190 lin. ft. 138-in. concrete sewer, 1,700 lin. ft. 138-in. concrete sewer,

special circular, or rectangular, 12,035 lin. ft. 114-in. concrete sewer, 30 manholes, 180 lin. ft. manholes, extra depth; 500 6-in. side connections, 24,000 lin. ft. piling, 1,000 cu. yds. extra concrete, 1:8; 50,000 lbs. extra steel, 15,000 lin. ft. subdrains, 8-in., 10-in., 12-in., etc.

Port Washington, Wis.—Bids will be received June 6 for \$35,000 bonds for sewer system.—W. B. Krause, City Clerk.

Kasmack, Sask., Can.—Installation of sewerage and water system is being considered.

Melville, Sask., Can.—Ratepayers have passed \$5,000 by-law for storm water sewers.

CONTRACTS AWARDED

San Francisco, Cal.—Constructing sewers in Mission st. and Mt. Vernon ave., to C. J. Harney, 158 Sanchez st., \$61,206.

Pensacola, Fla.—Construction of storm water and sanitary sewers, to J. W. Gurley & Co., of Mobile, Ala., by the Board of Bond Trustees at cost of \$77,232.90.

Westfield, Mass.—Furnishing sewer pipe for year, to Warner-Miller Co., New York.

Cloquet, Minn.—Building sewers and water main extensions, to Pastoret & Lawrence Co., Duluth, \$23,398.

Winona, Minn.—To Otis Abell for a storm water sewer on Johnson, Belleville and Mill sts., \$5,750.

St. Louis, Mo.—Constructing sewers in Washington Heights, to P. J. Clifford Contracting Co., \$31,397.

Rochester, N. Y.—Building Division 3 of storage disposal system, to Ripton & Murphy, \$169,834; contract involves nearly one mile of tunnel work in addition to trenching.

Utica, N. Y.—Building sewers: Sunset ave., to N. D. Peters, \$972; Canal st., to A. W. Fitch, \$1,943.45; and Linden st., to same, \$357.95.

Springfield, O.—To Huonker & Williams to lay Elmwood sewer and construct the Mill Run arch in Washington st.; company bid \$13,893 for Elmwood sewer, which specifies 8 and 12-in. vit. pipe, and 24 and 30-in. reinforced pipe; second bid was \$14,065, by M. J. Cooney; Mr. Cooney bid on 8, 12 and 24-in. vit. pipe and 30-in. reinforced pipe.

Central Point, Ore.—To Jacobson-Bade Co. for construction of sewer system, \$64,496.25; work includes 16,263 ft. of 8-in. pipe, 3,415 ft. of 10-in. pipe, 1,985 ft. of 12-in. pipe, 3,372 ft. of 16-in. pipe, 1,670 ft. of 20-in. pipe, 1,576 ft. of 22-in. pipe, 2,978 ft. of 24-in. pipe, 1,388 ft. of 50-in. pipe, 101 manholes, 8 inlets and 25,725 cu. yds. of excavation; other bidders: Jeffrey & Buf-ton, \$64,793.99; Haydon Bros., \$65,736.16; Geo. Gordon, \$66,489.95; Northwest Municipal Constructing Co., \$74,846.54; Jahn Contracting Co., \$77,650.66; M. A. Jones, \$76,953.65; Vincent & Boper, \$65,984.86.—J. W. Jacobs, City Recorder.

Rock Hill, S. C.—Building sewerage system, to Sullivan, Long & Hagerty, Bessemer, Ala., \$52,654.10; other bidders: John J. Cain, Columbia, \$53,586.50; Robertson Construction Co., Charlotte, N. C., \$53,633.15; P. J. Curran, Knoxville, Tenn., \$54,326.549.40; Johnson & Matthews, Florence, \$56,535.25; Guild & Co., Chattanooga, Tenn., \$57,211.25; Meek Construction Co., Atlanta, Ga., \$56,779.30; Greenwood Hardware Co., Greenwood, \$57,458; McCoslin Construction Co., Birmingham, Ala., \$57,641.65; H. S. Basler, Chattanooga, Tenn., \$59,668.50.

Richmond, Va.—To I. J. Smith & Co. for deep sewer on Broad st.

WATER SUPPLY

Columbiana, Ala.—Citizens will vote May 15 on \$7,000 bonds for construction of water works.

Imboden, Ark.—George Dutton has purchased from People's Bank water works and electric light systems and contemplates extension and improvement.

Oxnard, Cal.—Estimates will be prepared on cost of constructing water works and for paving of all streets.

Colorado Springs, Col.—Citizens have voted \$175,000 bonds to extend water system.

Olathe, Col.—Bids will soon be asked for installation of a municipal water system; estimated cost, \$58,000.—George H. Sethman, Denver, Engineer; Mattie A. Burns, Town Clerk.

Marietta, Ga.—Citizens have voted \$15,000 bonds for completing water and sewer system.

Thomaston, Ga.—Citizens have voted \$50,000 water works and sewerage bonds.

Clinton, Ind.—Council is considering building and equipping new water works plant.—William Hamilton, President Water Works Board.

Burden, Kan.—Rollins & Westover, Kansas City, Mo., are preparing plans for water works to cost \$15,000.—L. G. Crawford, City Clerk.

Cherryvale, Kan.—J. S. Worley, Kansas City, Mo., is preparing plans for water works.—E. E. Bellamy, City Clerk.

Homer, La.—Water Works Superintendent is now engaged at surveying town preparatory to laying pipes and mains for system of water works.

Baltimore, Md.—Grand Jury, D. M. Wylie, Foreman, has recommended erection of modern filtration plant.

La Plata, Md.—Town has voted \$15,000 bonds to establish water system.—P. E. Sasser, Town Commissioner.

Boston, Mass.—Metropolitan Water and Sewerage Board will soon lay approximately 15,000 ft. of 24-in. water pipe in order to supply Hyde Park, which has voted to join the Metropolitan Water District.—Henry H. Sprague, Chairman.

Shelburne Falls, Mass.—District has voted \$75,000 for installation of gravity water system; authority will be asked to take Fox and Houghton brooks as source of supply.

Detroit, Mich.—Council has authorized issuance of bonds by Water Commission for the following improvements: Completing the new 48-in. high pressure force main in Forest and Bewick aves., \$302,000; 48-in. force main through central part of city in Charlevoix, Berlin, Erskine and Alexandrine aves., \$1,152,000; completing 48-in. main in High, Baker and Dix aves., \$536,000; 42-in. main in Jefferson ave. West, from Solvay to Home sts., \$81,000; 48-in. main in Michigan ave., from Vinewood to Livernois, \$172,000; 24-in. main in Holbrook ave., \$35,000; 24-in. main in Carbon, Forman and Fort sts., \$68,000; 24-in. main in Hazelwood and Holcomb aves., from Russell to 3d st., \$48,000; 42-in. main in Canfield and Bethune aves., from Helen ave. to North Grand Blvd., \$28,000; improvements at pumping station, \$1,631,769.—J. J. Haarer, Commissioner of Public Works.

Courtland, Minn.—Village Council is considering installation of water works, including well, large tanks and 1,000 ft. of mains.

St. Charles, Mo.—Citizens have voted \$30,000 bonds for improvement of water works by laying 4,000 ft. of additional 12-in. water main and constructing two concrete reservoirs, capacity 1,000,000 gals. each.—Carr Edwards, City Engineer.

St. Charles, Mo.—Mayor John N. Olson has recommended improvements to city water system.

Cascade, Mont.—Installation of water works system is being considered.

Anselmo, Neb.—Citizens will vote on installation of water works and electric lights.

West Orange, N. J.—Town Council is considering \$15,000 bond issue for extension of water system and purchase of auto fire apparatus.

Tucumcari, N. M.—Citizens have voted for municipal ownership of water works; \$10,000 will be spent at once on extending three miles of mains into suburban district, erecting standpipe and installing about 65 fire plugs.

Fredonia, N. Y.—Board of Village Trustees has called election on May 15 on improving present water works system of the village; plans have been prepared by Engineer Wilder for system of improvements which it is claimed will insure clear water in addition the plans call for enlargement of the present reservoir to capacity of 180,000,000 gals.; estimate of cost of installing improvements is \$16,400.

Clayton, N. C.—Gilbert C. White, Durham, is preparing plans for water works and sewerage.

Mandan, N. D.—Citizens have voted \$80,000 bonds for construction of water works.—Burns & McDonnell, Kansas City, Mo., Engineers.

New Berlin, O.—Citizens have voted \$15,000 bonds for water works and \$20,000 for sewers.

South Charleston, O.—Village has defeated proposition to issue \$22,000 bonds for installation of water works.

Vian, Okla.—Citizens have voted \$20,000 water works bonds.

Weleetka, Okla.—Citizens have voted \$45,000 bonds for water works and electric light plant.

Blaine, Pa.—Citizens have defeated proposition to expend \$7,000 in enlarging water supply.

North Wales, Pa.—Establishment of filtration plant is being considered and committed is inspecting plant. Messrs. Morris, Kriebel and Baston are interested.

Bradley, S. D.—Citizens have voted \$4,000 bonds for erection of pumping house and \$10,000 for extension of mains.

Nashville, Tenn.—Nearly eight miles of new water mains will be placed this year by the City Water Works Department, according to plans now mapped out.

Kasmack, Sask., Can.—Installation of water and sewerage system is being considered.

Melville, Sask., Can.—Ratepayers have passed \$63,000 by-law for water works.

Ridgetown, Ont., Can.—F. W. Farncombe, London, has prepared plans for proposed water works system; supply from artesian wells; \$35,000 voted.

Welland, Ont., Can.—Ratepayers have carried by-law providing for \$75,000 for extensions and additions to the water works.—G. H. Burgar, Clerk.

CONTRACTS AWARDED

Anaheim, Cal.—By Anaheim Water Co., to Charles Schendler, city, for constructing 6,000 ft. of reinforced concrete pipe for the company's system.

Escondido, Cal.—By the Escondido Water Co., to A. S. Bent, Central Bldg., Los Angeles, for constructing 2,400 ft. of 8-in. cement pipe; to A. G. Thornton, Colton, for 4,000 ft. of 12-in. cement pipe.

San Francisco, Cal.—Constructing reinforced concrete viaduct on Mission st., to Healy-Tibbitts Co., \$104,200; other bidders were: Rickon Ehrhardt, \$113,950; Contra Costa Contracting Co., \$112,000; American Contracting Co., \$116,670.

Alamosa, Col.—To Marshall Bros., Las Animas, for building water works, \$74,000.

Bridgeport, Conn.—Furnishing 25 4-in. Fairbanks hydrants, to Hunter & Havens, and 25 5-in. hydrants, 50 hydrants and 50 boxes and caps, to R. D. Wood & Co.

Norwich, Conn.—Building Section 1 of pipe line, to Archibald Torrance, and Section 2, to Thos. Dodd.

Washington, D. C.—Furnishing 90 tons c.-i. water pipe and specials, to the Standard Cast Iron Pipe and Foundry Co., Bristol, Pa., \$51.50 per gross ton, and 2,411 tons c.-i. water pipe, to the Cast Iron Pipe and Foundry Co., New York, N. Y., \$22.84 per gross ton.

Sparta, Ga.—To Walton & Wagner, Atlanta, for construction of 3½ miles of from 4-in. to 8-in. water mains, two 750,000-gal. pumps, air compressor, boiler, power house, 100,000-gal. brick reservoir, 80,000-gal. tank on a steel tower, and for construction of 3 miles of sewers and purification plant.

Chicago, Ill.—By L. E. McGann, Commissioner of Public Works, to Gindele Bros., Chicago Opera House Block, for materials, labor, etc., necessary for pumping out sections 1 and 2 Southwest Land tunnel, constructing one 11-ft. shaft in earth and rock and constructing 250 lin. ft. of 9-ft. tunnel in rock and other work, \$47,700.

Owensboro, Ky.—To R. P. Farnsworth and L. M. Booth for construction of the proposed water softening plant; cost about \$25,000.

Alexandria, Minn.—Construction of water main on 6th st., to Wm. B. Bosworth, Ada, about \$2,100.

Chokio, Minn.—Water works system, Oscar Claussen Engineering Co., Nat. German-American Bank Bldg., St. Paul, Engineer; alternative bids on (a) air compressor system, consisting of 3,300-gal. reinforced concrete reservoir, about 5,600 ft. of 6-in. and 4-in. c.-i. pipe; pumping plant and accessories, including 15-hp. gasoline engine; 8-ft.x36-ft. compression tank, air compressor and air lift; 25-ft.x40-ft. power house; (b) gravity system consisting of 40,000-gal. steel tower and tank, about 5,600 ft. of 6-in. and 4-in. c.-i. pipe; 5-hp. gasoline engine, a deep well, pumping head and 14-ft.x16-ft. pump house; to J. G. Robertson, St. Paul, (a) \$3,776, (b) \$9,159; other bidders: Cook Construction Co., Des Moines, Ia., (a) \$9,460, (b) \$9,993; C. W. Roland Co., Des Moines, Ia., (a) \$9,560, (b) \$9,560; Gilbert W. Haggart, Fargo, N. D., (a) \$10,500; (b) \$10,600; Des Moines Bridge and Iron Co., Des Moines, Ia., (a) \$9,690, (b) \$8,895; Blackhawk Construction Co., Waterloo, Ia., pipe line \$4,541, steel tower and tank \$4,896; Minneapolis Steel and Machinery Co., Minneapolis, steel tower and tank, \$3,500; Magnee Johnston, Minneapolis, pipe line, \$5,611; Chicago Bridge and Iron Co., Chicago, Ill., steel tower and tank, \$4,025.

Cloquet, Minn.—Building water main and sewer extensions, to Pastoret & Lawrence Co., Duluth, \$23,398.

Minneapolis, Minn.—Furnishing special castings for the filtration plant, to James B. Clow & Sons, 350 Franklin st., Chicago, Ill., \$117 per ton, total amount \$3,805; to Rensselaer Valve Co. at \$1,822 for furnishing valves, and to Venturi Meter Co. for one 60-in. and one 6-in. meter.

Moberly, Mo.—Reconstruction of the water works plant; General contract to Commercial Construction Co., Kansas City, Mo., \$23,223, and \$1 per cu. yd. for extra concrete, and 40c. per cu. yd. for extra earth excavation; power house to G. A. Sinclair, city, \$9,191.

Kearney, Neb.—Supplying city with meter tops and cement boxes; tops to Kearney Iron Co. and boxes to W. T. Scott.

Wells, Nev.—To P. J. Moran, Salt Lake City, Utah, for building an 80-ft. dam in Bishop Creek District, about \$100,000.

Skillman, N. J.—To Harrison Construction Co., Newark, for extension of the

water system at New Jersey State Village for Epileptics, \$9,883.

Albany, N. Y.—To Eddy Valve Co., Waterford, for supplying hydrants for Water Department, \$2,462.50.

Cleveland, O.—Furnishing 25,000,000-gal. pumps, to Holly Mfg. Co., Roberts ave., Buffalo, \$112,769 each; for 3 to 24-in. c.-i. pipe, to the U. S. Cast Iron Pipe and Foundry Co., Cleveland, \$21.35 per ton; for 3 to 16-in. specials, to same, at \$53 per ton; for 20 to 24-in. specials, to Bowker Foundry Co., \$58.75 per ton; for miscellaneous castings, to same, at \$18.75 per ton; for 1 to 6-in. hydrants, to Florence Iron Works, \$21.75 and \$40.75, respectively; for valves, to Fairbanks Co., at the following prices: 24-in., \$163; 20-in., \$105; 16-in., \$53; 12-in., \$26.85; 10-in., \$21; 8-in., \$14.75; 6-in., \$9.45; 4-in., \$5.80; 3-in., \$4.20.

Toledo, O.—To Watters & Tansley, Toledo, to lay high pressure main water system, to give better fire protection to the district extending from Washington to Cherry st. and from the river to Michigan st., \$117,578.25; other bidders were: Breymann & O'Neill, city, \$118,887.80, and M. O'Hearn Co., Pittsburg, \$117,937.40; Engineer's estimate was \$121,000; work is to be completed within five months; pumping station will cost probably \$75,000 additionally.

Pittsburg, Pa.—By Department of Public Works, to William Kerr's Sons, Lewis Bldg., city, for constructing Mission st. pumping station, \$93,200.

Somerset, Pa.—Construction of concrete reservoir, borough to furnish all iron work, to W. G. Ferner, city, \$4,191.

St. Catharines, Ont., Can.—To National Iron Works, Toronto, Ont., for supply of 3,763 tons of standard piping, \$30.50 per ton, and 55 tons of special castings, \$59.

Winnipeg, Man., Can.—Wooden stave conduit for extension of water pipe line, to J. W. Astley, Engineer of Construction, \$7,40 per lin. ft., \$31,080.—M. Peterson, Secretary Board of Control.

LIGHTING AND POWER

Imboden, Ark.—George Dutton has purchased from People's Bank electric light and water works system and contemplates extension and remodeling.

Bakersfield, Cal.—Western Water Co. has been organized, capital \$200,000, to construct two large pumping plants, one to be equipped with two 200-hp. gasoline engines and two pumps of 25,000-bbl. capacity; the other plant to have one unit of same capacity; plants will supply water to west side oil fields.

Merced, Cal.—Merced River Land Co., Los Angeles, has purchased site and will in the near future install electric pumping plant.—W. O. Huse, Manager.

Patton, Cal.—State Engineer Nathaniel Ellery, Sacramento, has prepared plans for gas and electric plant to be installed at State Hospital; \$55,000 is available for this work.

San Francisco, Cal.—Great Western Power Co. will expend \$1,000,000 in improvements at its generating station at Las Plumas on the Feather River.

Jacksonville, Fla.—Electrical Committee of Bond Trustees has rejected all bids for the erection of foundations, superstructure and pier bulkheads of the municipal electric light power station; bids are as follows: Building superstructure which includes brick work, roofing, mill work, plumbing, heating, etc., F. W. Long & Co., Jacksonville, \$45,325; Logan Concrete and Engineering Co., Jacksonville, \$51,400; excavations, driving piling and putting down the foundations for the superstructure, together with necessary concrete work, F. W. Long & Co., Jacksonville, \$106,940; Logan Concrete and Engineering Co., Jacksonville, \$104,887; bid of the Foundation Co. of New York, in addition to foundation work, also covered construction of the pier bulkhead, which was only one received for pier.

Key West, Fla.—Council has voted to grant gas franchise for city to Starr & Reed.

Marietta, Ga.—Citizens have voted \$20,000 bonds for installation of electric light plant.

Kendallville, Ind.—Council has asked bids for 400-kw generator for electric light plant; cost about \$25,000.

Oakland City, Ind.—Bids will be asked for in near future for the construction of 8-in. pipe line to connect and supply natural gas to Oakland City, Winslow, Petersburg, Francisco and Princeton. B. Ayers, W. M. Frazee and J. H. Henley are interested.

Zionsville, Ind.—The Zionsville Water and Electric Light Co. is considering the installation of either oil engines or producer gas plant in place of present steam plant.—W. H. Palmer, Manager.

Lansing, Ia.—Council has granted franchise to Upper Iowa Power Co., Decorah, for installation of electric light plant.

Webster City, Ia.—Citizens will vote May 22 on \$25,000 bonds for new equipment at light and power plant.

Fort Scott, Kan.—Fire has completely destroyed plant of Fort Scott Gas and Electric Co., leaving city in total darkness.

Quenemo, Kan.—I. C. Bushong, Ottawa, has been selected to prepare plans for electric light plant; cost \$6,900.

Liberty, Ky.—Herren & Cundiff are considering erection of electric light plant.

Bangor, Me.—Substation of Bangor Railway and Electric Co., which furnished light to city, has been destroyed by fire.

Morris, Minn.—S. Stewart is planning installation of 209-hp. engine, new dynamo and other improvements at electric light plant.

Great Falls, Mont.—Great Falls Gas Co. will lay about three miles of gas mains in near future.—R. D. Dennison, Manager.

Anselmo, Neb.—Citizens will vote on installation of electric lights and water works.

Salem, N. J.—Council has under consideration plans of better method of lighting streets.

Tucumcari, N. M.—I. G. La Fite, Denver, Col., has purchased the local electric light plant from W. B. Buchanan, W. A. Jackson and W. H. Fuqua; about \$10,000 will be spent in improvements.

New Hartford, N. Y.—Village Council is considering establishment of municipal electric light plant; contract with Utica Gas and Electric Co. expires May 31.

Smithtown, L. I., N. Y.—Long Island Lighting Co. and Port Jefferson Electric Light Co. have petitioned for franchise.

Utica, N. Y.—Plans have been prepared and will be considered by Board of Contract and Supply for construction and extension of city's electric subways.

Durham, N. C.—Southern Power Co., Charlotte, has decided to build a distributing station.

Cleveland, O.—The Euclid Doan Power Co., Cleveland, has been incorporated to erect power house for the generation of electricity for commercial purposes.—S. H. Selbert, Joseph Morgenstern, F. Ethel Whipp, Sidney S. Harvey and A. J. Harvey, Incorporators.

Dayton, O.—Bids will be received until noon May 26 for \$25,000 bonds to light city.—G. W. Bish, City Auditor.

Greenspring, O.—Village Council is considering proposition for electric light plant.

Weleetka, Okla.—Citizens have voted \$45,000 bonds for electric light plant and water works.

Morrisville, Pa.—Establishment of municipal electric light plant is being considered.

Brenham, Tex.—O. C. Orbeck, of Clifton, has asked for franchise for gas plant.

Floresville, Tex.—A. B. Crawford, San Antonio, is considering installing of electric light plant.

Falls Church, Va.—Arlington Electric Co. desires prices on transformers, lamps, cross-arms, pins, insulators, poles, etc., for probably territory of 7½ to 10 miles.

Newport News, Va.—Citizens will vote June 24 on \$150,000 bonds to build and operate electric light plant.

Chehalis, Wash.—Franchise has been granted to the Twin City Light and Traction Co. and building of power house is being considered; cost \$75,000.—Frank Crown, Chief Engineer.

Goldendale, Wash.—The Pacific States Electric Co., Portland, has purchased electric light plant of this city from H. W. Fellows; system will be extended and improved by the new owners this spring.

Winona, Wash.—M. W. Peckler, Winona, has purchased site and will build power plant to supply Endicott, La Crosse and Winona with light and power.

Magog, Que., Can.—Electric light and power plant will be constructed at cost of about \$100,000.—Pringle & Sons, Montreal, Engineers.

Melville, Sask., Can.—Ratepayers have passed \$23,000 by-law for electric lights.

Sandwich, Ont., Can.—Franchise has been granted to Robert Stuart to build transmission line through city streets.

CONTRACTS AWARDED

Springfield, Mass.—By Municipal Building Commission for electric equipment of the new central heating and lighting plant, to the M. B. Foster Co., Boston, \$10,500.

Plymouth, Pa.—Lighting streets, alleys, etc., of township for seven years, to Luzerne County Gas and Electric Co.

Ogden, Utah.—To new Merchants' Light and Power Co., an organization of Ogden business men, for furnishing electricity for 80 street lights, \$1.75 a month per light.

BIDS RECEIVED

Barberton, O.—Lighting of city streets, Sun Vapor Street Lighting Co., Canton, only bidder; present contract with Mohican Oil and Gas Co. expires in June; bidder agrees to install 60 gas or gasoline lights of the latest design and 100 candle power for \$19.81 per year for each lamp providing they are given a three-year contract.

FIRE EQUIPMENT

Helena, Ark.—Mathews & Fry have prepared plans for erection of \$6,000 fire station.—Hugh Martin, Mayor.

Pasadena, Cal.—Citizens have voted bonds for fire department purposes, including purchase of engine.

San José, Cal.—Citizens will vote in June on \$6,000 bonds for fire and police department.

Hartford, Conn.—Fire Committee has accepted plans by F. W. Whiton and John J. McMahon for erection of fire station at Market and Temple sts. for Engine Co. No. 3.

Norwich, Conn.—Board of Fire Commissioners has recommended purchase of auto combination chemical and hose wagon to cost \$5,500.

East St. Louis, Ill.—Mayor Lambert has recommended establishment of four engine houses.

Wellsburg, Ia.—Fire department has been organized.—J. H. Kelly, Chief.

Bangor, Me.—Fire Chief Mason is urging need of 10,000 ft. of fire hose.

Lewiston, Me.—Board of Fire Commissioners has recommended purchase of auto truck.

Palmer, Mass.—Town needs fire alarm system.

Westfield, Mass.—Town will purchase fire auto.

Saginaw, Mich.—Board of Estimate has allowed \$8,000 for purchase of auto fire engine.

Englewood, N. J.—Council is favorably considering purchase of auto apparatus for fire department. Councilman Wm. Conklin is interested.

West Orange, N. J.—Town Council is considering \$15,000 bond issue for purchase of auto fire apparatus and extension of water system.

Albany, N. Y.—Erection of fire station for Steamer No. 2 is being urged.

Herkimer, N. Y.—Board of Trustees is favorable to improvement of apparatus of fire department.

Syracuse, N. Y.—Board of Contract and Supply has adopted resolution directing Secretary John J. Halloran to advertise for proposals to install apparatus for central office fire alarm system.

Portland, Ore.—City will sell bonds for building \$125,000 steel fireboat; plans being prepared.

Oxford, Pa.—Addition will be erected to fire engine house.

Reading, Pa.—Rainbow Fire Co. has purchased building which will be remodeled for use of Volunteer Firemen's Association.

CONTRACTS AWARDED

Sacramento, Cal.—City Trustees have decided to buy from Bowers Rubber Co. 3,000 ft. of hose and 80 poles for wires of the police and fire alarm system from R. E. Swain.

Pensacola, Fla.—Furnishing \$1,500 worth of hose, to Frank Griffith, special agent for Eureka Hose Co., New York.

Evansville, Ind.—Furnishing hose, to the Gutta Percha Co., 500 ft., 85c.; to the Chicago Fire Hose Co., 1,000 ft., \$1, and to New York Belting and Packing Co., 500 ft., \$1.10.

Springfield, Mass.—Erecting addition to Pine st. fire station: General contract, O. C. Rivest, \$21,700; heating, George H. McClean, \$1,340; electric, Foster Electric Co., Boston, \$968; plumbing, J. J. Cotter Co., \$1,693.

Bozeman, Mont.—Furnishing 95-hp. auto fire engine, to Webb Fire Apparatus Co., St. Louis, Mo., \$6,500.

Poughkeepsie, N. Y.—Furnishing 2,000 ft. Keystone hose, to Fabric Fire Hose Co., A. D. Francker, representative.

Cincinnati, O.—Building fire house on Eastern ave., to Cottler Building Co.

Bradford, Pa.—Furnishing motor truck for Chief of the Department, to Garford Co., Elyria, \$2,900.

Harrisburg, Pa.—Building Camp Curtin fire house on N. 6th st., to Thos. Ferree, \$7,110.

Tacoma, Wash.—Furnishing fire hose: To Washington Rubber Co., Inc., 2,000 ft., \$1,800; to The C. C. Fire Hose & Rubber Co., 2,000 ft., \$1,800; to Hunt & Mottet Co., 2,000 ft., \$1,800; to Palace Hardware Co., 1,000 ft., \$1,000. To the International Power Co., for purchase and delivery of one-third size Amoskeag steam fire engine, with heavy oscillating platform, \$4,850.

BIDS RECEIVED

Sacramento, Cal.—Furnishing automatic aerial truck, motor-driven, for the Fire Department: Graham-Murdoch-Williams Co., truck to cost \$12,150; Gorham Engine and Fire Apparatus Co. offered machine for \$11,375; third bid was for truck to be drawn by horses.

BRIDGES

Hollister, Cal.—County Surveyor A. M. McCray has estimated cost of repairs to county bridges and the construction of two new bridges at \$100,000.

Pasadena, Cal.—Citizens have voted bonds for erection of bridge.

San José, Cal.—Citizens will vote in June on \$55,000 bonds for bridges and improvement of creeks.

Vacaville, Cal.—Bids will be received May 16 for the purchase of \$15,300 bonds for concrete bridge and \$2,500 for septic tank.—P. A. Steiger, Benicia, Engineer.

Mayo, Fla.—Boards of this and Severance counties have decided to build bridge across Suwanee River at Dowling Park; bids being asked.

Jesup, Ga.—Wayne County will vote \$100,000 bonds to construct bridge across Altamaha River and build roads.

Westernport, Md.—Bids will be received May 23, noon, for \$5,000 bonds to erect concrete bridge across George's Creek.—J. P. Miller, Chairman Finance Committee.

Mantua, N. J.—Turnpike Co. has instructed Engineer Cattel to prepare plans for concrete bottom bridge to be erected over Mantua Creek.

Massena, N. Y.—Bridge over the Raquette River on Depot road has been condemned by State Highway Department; estimates for concrete structure are being prepared; cost about \$30,000.

Niagara Falls, N. Y.—Niagara Town Board has approved plan for bridge over the Cayuga Creek, concrete structure for which \$3,500 has been set aside.

Whitesboro, N. Y.—State Highway Department has prepared plans for steel bridge, concrete pier and roadway over Sauquoit Creek.

Wilmingon, N. C.—New Hanover County will vote May 31 on \$50,000 of bonds for bridge and road improvements and construction.—D. McEachern, Chairman County Commissioners.

Dayton, O.—Bids will soon be asked for constructing the Wolf Creek bridge at the confluence of Miami River and Wolf Creek; cost is estimated at \$17,000.—William A. Budroe, Clerk Department Public Service.

Toledo, O.—Plans will be prepared by the City Engineer for erecting bridge over Lake Shore Railroad on Summit st.

Altoona, Pa.—Commissioners of Blair County have appropriated \$3,000 for repairs to seven county bridges.

Coatesville, Pa.—Chester County Commissioners are considering erection of bridge over Brandywine Creek.

Pittsburg, Pa.—County Commissioners have decided to erect \$12,000 bridge across Pine Creek on Butler plank road in Shaler Township.—S. D. Foster, County Road Engineer.

York, Pa.—County Commissioners have decided to rebuild stone bridge at the mouth of Fishing Creek, between the Townships of Lower Windsor and Chanceford; plans are being prepared by W. R. Smith, County Engineer.

Germantown, Tenn.—Citizens will vote on \$3,000 bonds for bridge construction, street and sidewalk improvement, etc.

CONTRACTS AWARDED

Jacksonville, Fla.—Repairing bridge over Big Pottsburg Creek, to J. E. Ivanoski, \$2,700.

Boston, Mass.—To Lawler Bros. for building temporary draw at Dover st. bridge, \$2,079; other bidders: George T. Rendle, \$2,203.79; W. H. Ellis, \$2,611; Engineer's estimate, \$2,500.

Jersey City, N. J.—Building bridge over Morris Canal at Communipaw ave., by the Board of Freeholders, to Stillman, Delehanty and Ferris, \$7,620; other bidders, Cement Paving Construction Co., \$9,850; Joseph H. Cutley, \$10,650; Bond & McNally, \$10,800; F. W. Schwyers, \$12,450.

Scranton, Pa.—Building nine new bridges and repairing another, by County Commissioners: Over Spring Brook Creek in Moosic, to York Bridge Co., \$2,745; over Sulphur Creek, Mayfield, to T. C. Cummings, \$580; over Mother Harding's Creek, Mayfield, to J. W. O'Brien & Son, \$820; over creek near Glenburn Pond, Glenburn, to W. E. La Rue, \$995; over Lily Lake Creek, Dalton, to W. E. La Rue, \$395; over Kennedy's Creek, on road from Dalton to East Benton in North Abington, to Dingleberry & McLaughlin, \$510; over outlet of Bassett's Pond, near George C. Gibbs' residence in Benton, to George H. Nichols, \$500; over Gardner's Creek, near W. J. Biesecker's, Newton, to W. E. La Rue, \$295; over Depew's Creek in Covington, to Edward Wise, \$680; for repair of bridge over Wardell's Creek in Covington, to Edward Wise, \$400.

Petersburg, Va.—Building four concrete bridges, to Coleman Construction Co.

MISCELLANEOUS

Huntsville, Ala.—Citizens have voted \$100,000 bonds for erection of municipal hotel.

Auburn, Cal.—Board of Trustees is considering bonding of city for permanent improvements.

Oakland, Cal.—Citizens will vote June 6 on \$500,000 bonds for purchase of site and erection of infirmary building.

Pasadena, Cal.—City Commissioners have voted \$1,000 for establishing of a summer playground at Wilson School.

Pasadena, Cal.—Citizens have voted bonds for erection of addition to city hall.

Sacramento, Cal.—City Trustees have decided to advertise for bids for construction of a bandstand in the City Plaza to cost about \$1,200.

Sacramento, Cal.—Mayor M. R. Beard has recommended erection of city jail.

San José, Cal.—Citizens will vote in June on \$110,000 bonds for improvement of Alum Rock Park, \$2,000 for public comfort stations, \$50,000 for incinerator and \$60,000 for police and fire department.

Pueblo, Col.—Need of 50-hp. auto police patrol is being urged.

Washington, D. C.—Argentine budget for 1911 makes provision for expenditure of about \$42,500 on various public works, principal items with estimated cost being as follows: Purchase of two suction dredgers for port of Buenos Aires, \$580,000; purchase of dredging plant for certain rivers, \$550,000; building and furnishing of new Law Courts, \$2,550,000; construction of new General Post Office, \$430,000; new port at Mar del Plata, \$2,960,000; construction work on various railways and purchase of rolling stock, etc., \$19,325,000; construction of military barracks, \$850,000; construction of port of Quequen, \$775,000; extension of water supply and drainage works in Buenos Aires, \$3,830,000; water supply and sanitary works in several towns in Provinces, \$2,550,000; and construction of immigrants' hotels and homes, \$1,375,000. Address No. 6659 Bureau of Manufactures.

Jacksonville, Fla.—City Engineer Philip Prioleau has submitted detailed plans for proposed improvements in Ingleside Park, Riverside; \$2,500 available.

Freeport, Ill.—Chief of Police Root has asked for police telephone system and auto runabout.

Boston, Mass.—Council is considering \$50,000 appropriation for court house and police station for Charlestown and \$65,000 for court house for Boston.

Newark, N. J.—Upon recommendation of Finance Committee Council has voted to issue bonds to erect almshouse on a new site, building for the Board of Health, city dispensary and clinics, central fire station with accommodations for two companies housed at present in Branford place, police station in Sixth Precinct, fire truck house in the Sixteenth Ward, house for nurses of the City Hospital and public baths to cost \$125,000.

Trenton, N. J.—Council has adopted resolution permitting Harbor Board to issue \$50,000 bonds to carry out plans for acquiring land along Delaware River front for establishing docks and harbors.

Albany, N. Y.—Council is considering purchase of site for addition to Police Station No. 1, Arch and Broad sts.

New York, N. Y.—Plans have been filed by Architects Hoppin & Koen, 244 5th ave., for erection of four-story police station for Eighth Precinct at corner of Beach and Varick sts.

Philadelphia, Pa.—Mayor Reyburn has asked Councils to authorize him to engage an architect and execute contract for the erection of municipal convention hall in Fairmount Park.

Henning, Tenn.—City has decided to erect jail.

Omak, Wash.—Town is considering bond issue for public improvements.

CONTRACTS AWARDED

Waycross, Ga.—Erecting county jail, to Pauly Jail Co., St. Louis, about \$34,000.

Boston, Mass.—Building wooden landing piers in Charles River, Lower Basin, Boston, to Lawler Bros., Charlestown, \$7,380.

Bozeman, Mont.—Sprinkling Main st., to S. Collett, \$113.50 per month.

Hightstown, N. J.—Sprinkling streets for coming season, to J. Ely Robbins, 37c. per hour.

Cincinnati, O.—To C. F. Runck, Jr., for building Elm st. concrete steps, \$3,074.

Cincinnati, O.—Shelter house and comfort station, by the Board of Park Commissioners, to William Miller & Son, Pearl and Martin sts., city, \$9,373.

Reading, Pa.—By Board of Public Works, to John A. Rauhen to clean streets for five years.

Galveston, Tex.—Installation of a garbage crematory here, to the Speclalty Engineering Co., Houston, \$8,500.

Municipal Journal

VOLUME XXX

NEW YORK, MAY 17, 1911.

No. 20

MIXING WITH STANDARD CONCRETE MIXER, SECTION NO. 5

THE BRONX EXPERIMENTAL ROAD

Methods of Laying and Cost of Each of Eighteen Sections—Conditions after Six Months' Use—
Bituminous Pavements—Hand and Machine Mixing and Penetration Method

THE BRONX experimental road, laid by the Commissioner of Public Works, Borough of Bronx, New York City, a brief account of which was given in the MUNICIPAL JOURNAL, November 10, 1910, has now been subjected to traffic for about six months and some of the conclusions which it was the purpose of the construction to ascertain can already be drawn. The purpose of the laying of the eighteen kinds of pavement in a single continuous stretch was to ascertain what sort of construction would meet the needs of that part of the city and the cost of which would not bear so hard on property owners as would the standard types of pavement laid in the lower portions of the city. In fact, a legislative act was passed providing for the laying of pavements, temporary in character, the cost of which would be charged to property owners and credited to them later when a higher class pavement should be laid. In this respect the results were satisfactory and a

number of the types of pavement laid experimentally will be constructed, perhaps in large areas, during the coming season.

The experimental pavements were laid on the White Plains road, a suburban thoroughfare leading to Mount Vernon and other cities. Sections of about 325 feet were laid of each pavement, the total length of the 18 kinds being 4,120 feet. The road is a wide one with two car tracks and the paved strip on the east side of the road is about 20 feet wide. A traffic census taken under the direction of William H. Connell, assistant commissioner of public works, who also was responsible for the laying of this experimental road and had charge of its construction, shows that about 300 vehicles a day used the road. The figures were doubtless correct, but on the day that the accompanying photographs were taken the traffic appeared to be much greater than this. The number of heavy two- and even four-horse loads using the road at that time gave it the

appearance of carrying what would generally be considered as a fairly heavy traffic. At any rate, the number of automobiles and heavy steel tired trucks was sufficient to severely test the wearing qualities of any type of construction. (Mr. Connell stated to the writer, since the above was written, that the traffic is now three times as heavy as in the fall, when the census was taken.)

There has been sufficient traffic to develop faults, if any of the sections were actual failures, but the general surface of the paved sections throughout is good. In most instances the surface is closing up well, indicating that the pavements will withstand winter conditions. Whether any of them will form waves in summer cannot as yet be foretold.

As regards costs, not many conclusions can be drawn, although a close examination of the items, with consideration of all the conditions, furnishes some comparative cost data. In general, the opinion of assistant commissioner Connell may be quoted. He gives it as his opinion that in work of considerable extent the costs would be from 20 to 30 per cent less than the actual cost of the experimental sections. It would hardly be fair, though, to assume that the ratios between costs of large work would be the same as those between these sections. The items of chance and management figure very largely in small pieces of work. The question of thickness of bituminous material is of the utmost importance in controlling costs. In small areas of work done in cold weather the material is laid thicker than under ordinary conditions when things are moving smoothly on a large job. A bituminous stone mixture weighs about 110 pounds per square yard one inch thick. A bituminous sand mixture weighs about 100 pounds per square yard one inch thick. These figures should be born in mind when examining the cost details and thickness of material used.

As regards conclusions to be drawn later, it should be borne in mind that the possible inferiority of any one of these pavements need not necessarily condemn it, if evidence favorable to it can be found elsewhere; for the mixture might be out of balance, be too rich or too dry, or have too much or too little fine material. However, as the work was all carefully done under expert supervision the presumption will naturally be that tests are fairly representative.

Two kinds of foundations were used on the Bronx experimental road—cement concrete and bituminous concrete. Each of these has advantages and disadvantages peculiar to itself. The bituminous concrete foundation has a great advantage in cost. About four inches of bituminous concrete cost about 30 cents on the average and $4\frac{1}{2}$ inches of Portland cement concrete cost nearly 60 cents. On large work, with perhaps a half-inch reduction in thickness, it would seem that the concrete ought to be laid for about 40 or 45 cents, while the bituminous base could hardly be reduced below 25 cents even on a large job. As regards rigidity the concrete has the advantage. The pavements laid on the bituminous base in a number of instances show that the rolling settled the stone or pushed it out of place. This was partly due to an error in construction; a ten-ton tandem roller would have been better for this work than the heavier macadam rollers. This fact was appreciated at the time the work was going on, but it was impossible to obtain a tandem roller. The bituminous base, in spite of its cheapness, is, in the opinion of most asphalt experts, better in one respect than the concrete base (although the extent of the superiority has not been determined) in that the bitumen in the base stone acts as a reservoir of light bituminous oils, and as these disappear from the surface material by evaporation or disintegration their place is supplied by the oils from the base. This gives the surface coat a longer life than it has when laid on concrete. Moreover a surface might wave, due to lack of bond with the concrete, which would not slip on a bituminous base. On the other hand, when a pavement is cut into the repairs are most perfectly made if the base is of cement concrete. In this road, where both kinds of base are used, time may shed some light on this puzzling question.

The pavements of the experimental road can be classified into two general divisions according to the method of construction employed—the penetration and mixing methods. Three sections do not come in either class; they are cement concrete laid by the Hassam method, a section of plain water bound macadam and a strip of macadam with road oil poured over the surface. The sections of macadam, one treated with rod oil and the other not, are interesting as both of them at the present time show signs of disintegration, but each by different kinds of traffic. The difference in the wear caused by automobiles and by steel tires is coming to be clearly distinguished. Simple and economical methods of construction which will resist one kind of wear do not stand the other. Plain water bound macadam stands the wear of steel ties but ravel under automobile traffic. Macadam treated with oil will stand automobile traffic, but steel tired wheels cut it up. In the White Plains road, the plain macadam section shows signs of raveling; the oil treated section is badly cut up by steel tires.

The sections of pavement laid by the penetration method cost less than those laid by mixing methods. In general their appearance is excellent. In fact it is impossible to distinguish by superficial examination, with absolute certainty, between mixed and penetration pavements. Unquestionably, however, the difference is there, could be clearly seen by digging into the pavement, and will probably show in time in the lower cost of maintenance of the mixed materials. If there is any exception to this apparent equality it is in favor of the tar penetration pavements. On account of its slight viscosity when hot, tar mixes with the stone much better than does the more viscous asphalt. This makes it impossible to distinguish superficially between a tar penetration and a tar mixed roadway. As there is generally more tar in a poured than in a mixed pavement it is possible that this excess may outweigh in importance the imperfections in mixture of the former and that a tar penetration pavement may last as long as a tar mixed pavement. This is another undetermined factor which the Bronx experimental road may in time help to determine.

Among the samples of mixed bituminous pavements are some mixed by hand. The results both as regards cost and quality are such as almost to eliminate hand mixtures from practical consideration in work of any considerable extent. The ordinary plant charges on any piece of work of a mile or so in extent should not exceed 10 cents per square yard. The excess cost of hand mixtures over machine on this work was much more than that amount. In hand work the labor and fuel cost of heating is high and would not be reduced much on large work. Moreover an excess of asphalt is very apt to be used in hand work. If the stone is a little cold more asphalt has to be used to facilitate mixing, although there is probably no advantage in using the excessive quantity and there may be a disadvantage in that the mixture might be too soft in summer. At any rate machine mixed stuff is more uniform; whatever percentage of bitumen is believed to be desirable can be put in and properly mixed. Also more fine material can be used in machine mixed stuff and hence the pavement is firmer. These theoretical considerations can be confirmed by close inspection of the White Plains road on a hot day.

On one section of this road cold stone was used, the mixing being done by an ordinary concrete mixer. The economical results in this instance were very satisfactory. It was necessary, however, to omit the screenings from this mixture, but as a very viscous Texas asphalt was used, the result will very likely be satisfactory. Still it seems probable that somewhat better results might be obtained by heating the stone and adding some finer aggregate. Another section of the road was laid using the Sicilian Company's asphalts, which apparently is a sand mixture and looks very much like any asphalt pavement.

The pavement which is regarded by the city officials as the most satisfactory is No. 2, Bronx specifications for bituminous macadam mixture, laid on concrete, the surface mixture made in a plant. Owing to litigation over the Warren patents it is probable that this kind of pavement will not be laid during the coming season.

A considerable amount of pavement not exactly like any of the experimental sections probably will be laid to meet the requirements of the conditions created by the new law. This is simply a four-inch Portland cement foundation, over which will be laid 1½ or 2 inches of asphalt and sand mixed in accordance with ordinary specifications for standard asphalt pavements.

This leads up to a consideration of the merits of sand and stone for surface mixtures of bituminous pavements. It seems to be generally assumed that for road work stone is better than sand and doubtless it has advantages. There are however no published data proving that the stone mixture is more durable than the sand mixtures. As regards cost, the questions of thickness and percentages of bitumen, to say nothing of different relative costs of sand and stone in different localities, are so complicated that it cannot be stated definitely that one pavement is cheaper than the other. If it could be stated definitely what thickness of sand-bitumen mixture would wear as long, under the same traffic conditions, as a certain thickness of stone-bitumen mixture, then the problem could be answered for any locality. Reliable data regarding this, however, do

A detailed description of the 18 sections of the road and some of the items of cost follow.

Sections 1 to 10—Mixing Methods

SECTION 1

Bituminous Pavement Mixing Method Laid by the Barber Asphalt Company

Foundation Course—A concrete foundation was laid to a finished depth of 4½ inches in proportions of 1:3:6.

Surface Course of Paving Mixture—The paving mixture consists of the following mineral aggregate by weight: 73 per cent paving gravel, 10½ per cent sand, 1½ per cent dust and 5.4 per cent Bermudez asphalt, 55 penetration. The mixing was done at the Barber asphalt plant, then laid at a temperature of 220 degrees and rolled to a finished depth of 1¾ inches with a 10-ton roller.

Seal Coat—From 0 + 00 to 1 + 52, ¼ gallon of asphaltic cement to the square yard was applied, over which sand was spread.

Cost Per Square Yard

Concrete Foundation.....	\$0.639
Surface Course	0.715
Seal Coat	0.085

COMPLETED SECTION OF WHITE PLAINS EXPERIMENTAL ROAD
Section No. 8 in foreground

not exist. Perhaps the laying of experimental roads may in time supply the deficiency. If a bituminous stone base is sufficient to carry the traffic, the stone mixture has the advantage that it can be laid directly on the base and the result is a cheap pavement. If a concrete base is required, and an asphalt-stone binder used as in standard asphalt pavement, the cost runs up into high figures. If this binder be omitted, then the question as to durability of the pavement arises.

The photographs accompanying this article were taken of sections of the street located about 6 feet from the margin of the pavement. In all cases portions of the street were selected where no seal coat had been applied, as it is believed that the best idea of the texture of the pavement is obtained by photographing such sections. (In this connection it may be stated that, owing to the cold weather and high wind during construction the application of the seal coat was not as successful as it would have been in warm weather.) The method of taking the photographs was as follows: A 3-A folding pocket kodak was suspended between two tripods, resting firmly on the broad flat top of one of them. The lens of the camera was about 3½ feet from the pavement and a portrait lens was placed over the regular lens to secure proper focus. The opening in the lens was varied from 32 to 64 and the time of exposure was from a quarter of a second to a second, according to the varying light.

The surface was laid by the Barber Asphalt Paving Company at a price agreed on.

The gravel used in the mixture was of a siliceous nature. Most of the pebbles on the surface appear to have been crushed by the roller. In some spots the gravel appears to have separated from the bitumen and fine material, having an excess of gravel, which shows some signs of ravelling, or breaking up. The general surface, however, is excellent.

SECTION 2

Bituminous Pavement Mixing Method Laid in Accordance with Borough of The Bronx Specifications

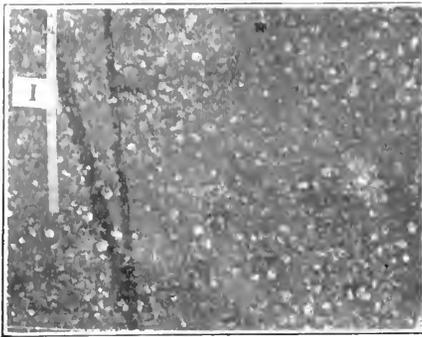

Foundation Course—1½-inch crushed trap rock was spread and thoroughly rolled with an 18-ton roller to a finished depth of about 3¾ inches.

Surface Course or Paving Mixture—The paving mixture is composed of two parts crushed trap rock passing through a 1¼-inch ring and not containing more than 5 per cent dust, 1 part sand and 7.4 per cent by weight of Bermudez asphalt, 55 penetration. The mixing was done at an asphalt plant and the paving mixture laid at a temperature of 220 degrees and rolled to a finished depth of 2½ inches with a 10-ton roller.

Seal Coat—From 3 + 25 to 4 + 78, ¼ gallon of asphaltic cement to the square yard was applied, over which chips were spread and rolled.

This is an excellent section, and much similar work would have been done this year if it were not for litigation over patent rights.

SECTION 3

Foundation Course—A concrete base was laid under the supervision of C. I. Williams, of Utica, N. Y., to a finished depth of 4 3/4 inches, 1 1/2-inch stone was spread to a depth of 6 inches; then screenings and cement mixed dry in proportions of 3-1 were spread, rolled, and sprinkled with water, the operation was repeated until the voids were filled. An eighteen-ton roller was used.

Paving Mixture or Surface Course—The paving mixture is composed of two (2) parts crushed trap rock passing through a 1 3/4-inch ring and not containing more than 5 per cent. dust, 1 part sand, and 8 per cent. Bermudez asphalt, 55 penetration. The mixing was done at an asphalt plant and the paving mixture was laid at a temperature of 220 degrees and rolled to a finished depth of 2 inches with a ten-ton roller.

SECTION 4

Bituminous Pavement Mixing Method Laid Under the Supervision of the Standard Oil Company

Foundation—1 1/2-inch crushed trap rock was spread and thoroughly rolled with an eighteen-ton roller to a finished depth of about 3 3/4 inches.

Surface Course or Paving Mixture—The paving mixture consists of the following mineral aggregate by weight: 58 per cent. 3/4-inch trap rock, 20 per cent. 3/8-inch chips, 15 per cent. sand and 7 per cent. Standard Oil Company special asphalt binder. The binder, trap rock and sand were heated on the ground and mixed by hand on mixing boards, the mixture was spread and rolled to a finished depth of 2 3/4 inches with an eighteen-ton roller.

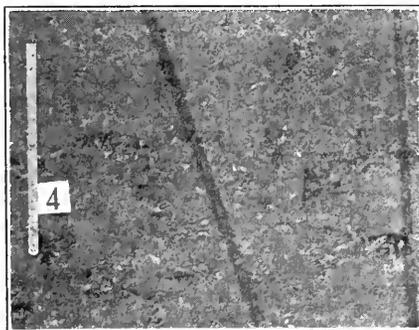

Seal Coat—From 9+95 to 10X66, 1/3 gallon to the square yard was applied, over which chips were spread and rolled.

SECTION 5

Bituminous Pavement Mixing Method Laid Under the Supervision of the Texas Co.

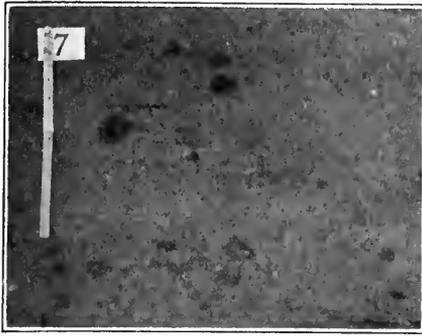

Foundation Course—1 1/2-inch crushed trap rock was spread and thoroughly rolled with an eighteen-ton roller to a finished depth of about 3 3/4 inches.

Surface Course or Paving Mixture—The paving mixture consists of 3/4-inch trap rock and 6.7 per cent by weight of Texas macadam binder. The binder was heated and mixed with the cold stone in a standard concrete mixer on the ground. The paving mixture was spread and rolled with an eighteen-ton roller to a finished depth of 2 3/4 inches.

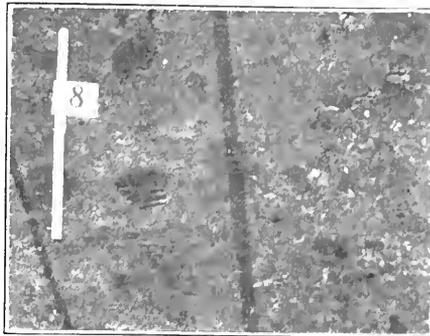

Seal Coat—From 12+36 to 13+03, a seal coat of Texas 55 special, about 1 1/4 gallons to the square yard, was applied, over which chips were spread and rolled.

ASPHALTO, PLANT MIXED

TARVIA X, HAND MIXED

BERMUDEZ ASPHALT, HAND MIXED

This is one of the most interesting sections in the whole work. The stone shows plainly, owing to lack of fine material. The surface is extremely uniform throughout. The feeling of the pavement under the feet is distinctly soft or rubber-like, in spite of the fact that the stone shows on the surface more plainly than in any other asphalt-mixed section. Signs of wrinkling and cracking under the roller, perhaps due to soft foundation, are evident in places. A slight tendency in this direction may be noted near the foot of the ruler in the illustration No. 5.

Cost of Surface Course

	Total.	Per Sq. Yd.
Labor	\$182.86	\$0.234
3/4-in. Trap Rock, 81 cu. yds., at \$1.80	145.80	0.186

Concrete Mixer (rent), 7 days, at \$1.00	28.00	0.036
782 sq. yds. at \$0.721	\$564.02	\$0.721
Weight of surface mixture per sq. yd.		300 pounds

SECTION 6

Amiesite Laid Under the Supervision of the Amiesite Co.

Foundation Course—1 1/2-inch crushed trap rock and sufficient screenings to fill the voids was spread and rolled with an eighteen-ton roller to a finished depth of 3 1/2 inches.

Surface Course of Paving Mixture—The paving mixture was shipped from the Amiesite plant and laid in two courses, the first course was composed of 1 1/2-inch stone with binder, etc., laid and rolled to a finished depth of 2 inches. The second or wearing course was composed of 5/8-inch trap rock, binder, etc., laid and rolled to a finished depth of 1 inch. The paving mixture therefore had a finished depth of three inches. An eighteen-ton roller was used.

Surface is very close, hardly distinguishable from a standard asphalt surface, especially where travel has been heaviest.

SECTION 7

Sicilian Asphalt Laid by the Sicilian Asphalt Co.

Foundation Course—Consists of 1 1/2-inch crushed trap rock laid and rolled with an eighteen-ton roller to a finished depth of 4 1/2 inches.

Surface Course of Paving Mixture—The paving mixture is called Asphalt and was mixed at the Sicilian Asphalt Company's plant and hauled to White Plains avenue and spread. The paving mixture was not rolled until comparatively cool with a Sicilian asphalt ten-ton grooved roller, to a finished depth of 1 1/2 inches. A light layer of cement was then sprinkled over the surface.

This is evidently a mixture containing sand and considerable fine dust. It is a secret but not a patented mixture. Spots in the illustration are oil dropped from automobiles.

SECTION 8

Bituminous Pavement Mixing Method Laid Under the Supervision of the Barrett Manufacturing Co.

Foundation Course—1 1/2-inch crushed trap rock and screenings was spread and rolled with an eighteen-ton roller to a finished depth of 3 3/4 inches.

Surface Course or Paving Mixture—The paving mixture consists of 3 parts 3/4-inch trap rock, 1 part chips and 6 1/2 per cent. by weight of Tarvia X. The trap rock and Tarvia X were heated on the ground and mixed by hand on mixing boards, spread and rolled with an eighteen-ton roller to a finished depth of 2 3/4 inches.

Seal Coat—About .6 of a gallon to the square yard of Tarvia X was applied, over which chips were spread and rolled.

HAND MIXING ON SECTION NO. 4 WHITE PLAINS EXPERIMENTAL ROAD.

SECTION 9

Bituminous Pavement Mixing Method

Foundation Course—1½-inch crushed trap rock and screenings were spread and rolled to a finished depth of 3¾ inches.

Surface Course or Paving Mixture—From 22+75 to 23+02, the binder consists of a mixture, tar and 10 per cent. of refined Bermudez asphalt. From 23+02 to 24+00, the binder consists of a mixture of tar and 15 per cent. of Bermudez asphalt of 60 penetration. From 24+00 to 24+40, the binder consists of a mixture of tar and 15 per cent. of Bermudez asphalt of 110 penetration. From 24+40 to 24+50, Bermudez asphalt of 110 degrees penetration was used for a binder. The paying mixture consists of 3 parts ¾-inch trap rock, 1 part chips and 7 per cent. by weight of bitumen. The stone and binder were heated on the ground, mixed by hand on mixing boards, spread and rolled with an eighteen-ton roller to a finished depth of 2¾ inches.

Seal Coat—About .6 of a gallon of asphalt per square yard was applied, over which chips were spread and rolled.

Sections 11-18 Penetration or Other Systems

SECTION 11

Barrett Manufacturing Co.'s "Modern Pavement"

Foundation Course—1½-inch crushed trap rock was spread and rolled to a finished depth of 3 inches.

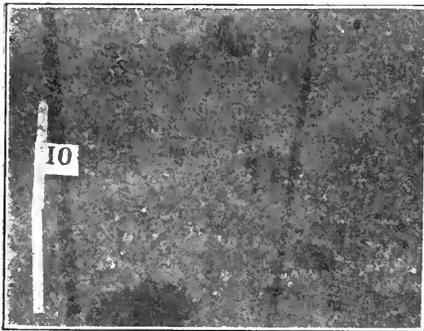

Surface Course or Paving Mixture.—A sufficient quantity of sand was spread to fill the voids and laid about ½ inch in thickness on top of the foundation course, over which about 1 gallon of Tarvia X to the square yard was applied. 1½-inch crushed trap rock was then spread and lightly rolled to a depth of 3 inches. About 2 gallons of Tarvia X to the square yard was then applied by the penetration method. A layer of ¾-inch stone was spread and rolled. An eighteen-ton roller was used.

Seal Coat—About 1 gallon to the square yard was applied, over which course sand was spread and rolled.

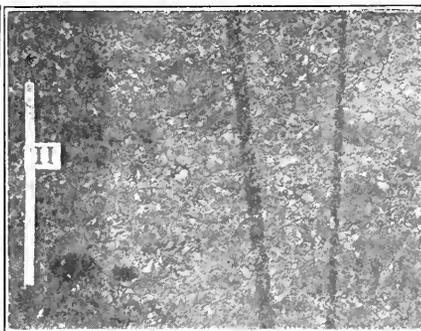

Cost Per Square Yard

Base Course	\$0.305
Surface Course	0.698

Marks of horse's shoes show plainly in the illustration. In the more heavily traveled portion of the road the bituminous layer has been picked up, rolled about and is a bad mess. Travel is too heavy for this class of work.

A comparison of the accompanying photographs with the reproductions of the surfaces of the Ohio experimental road published in the MUNICIPAL JOURNAL January 4, 1911, will show that the stone in the Bronx road is not so plainly evident. In the latter the large stones in those mixtures which contain them—many of the mixtures have no stones larger than ¾ inch—are more completely bound in with bitumen and fine material. This more complete binding is a merit in itself, if the pavements are not too soft in summer. An additional reason why the stone does not show so plainly in the Bronx work is that the color of the trap rock in this is dark gray, making it inconspicuous as compared with the light colored Ohio stones.

SPECIFICATIONS FOR MICHIGAN HIGHWAYS

Construction Necessary for Receiving State Reward—Specifications for Clay-Gravel, Gravel, Stone-Gravel, Gravel-Stone and Stone Roads—Why Gravel Roads Are Popular—Care of Clay and of Sand Roads

THE laws of 1909 of the state of Michigan provide for a payment or "reward" by the state to townships for roads built by them which conform to certain requirements. The state department has set forth plainly what these requirements are, and in its 1910 report has also given specifications for roads using the various local materials found within the state. It is required that roads to receive state reward should be well graded, that the steepest grade should not exceed 6 per cent and that the width should not be less than 18 feet between side ditches; that it shall be properly drained and have a wagonway or travel track not less than 9 feet wide. It is also provided that both shoulders and metaled track be properly crowned so as to shed water quickly to the side ditches. Such roads if of sand-clay and gravel receive a state reward of \$250 a mile. Two-layer gravel roads receive \$500 a mile. A layer of broken stone covered with a top course of gravel receives \$750 a mile. A bottom course of gravel or slag and a top course of crushed stone receives \$750 a mile. Two-course macadam received \$1,000 a mile. Not more than two miles in any one township will be granted a reward in one year.

The clauses of the specifications for grading, drainage and shoulders are common to all roads and provide that the finished road should be not less than 18 feet between side ditches and have a cross section oval in form, with an average rise of one inch to the foot from the inner edge of the ditch to the center line of the road. The Highway Department recommends that for heavily traveled roads the distance between ditches be made at least 20 feet. The side ditches are to have sufficient incline to cause a free and uniform flow of water to the nearest natural outlets, which outlets must be so improved, where necessary, as to carry the water quickly away from the highway.

Shoulders of suitable material are to be formed not less than nine feet apart and extend to the side ditches or gutters at the same grade and curvature as required for the finished road. Where the road grade is high the shoulders may be formed by moving earth from the center of the present road grade to the sides, or, if the grade is low, by crowning the present road grade by scraping earth from the sides toward the center; or, if sufficient suitable material cannot be had along the roadway, it can be brought from other places. The bed thus formed must be crowned to conform to the grade and section of the finished road and 8 inches below the finished surface.

CLAY-GRAVEL

A good quality of clay is then to be spread upon the road to a uniform depth of 3 inches and rolled sufficiently to crush the lumps, if there are any, and then harrowed until thoroughly pulverized. Immediately after harrowing, three inches of sand, which may be scraped from the sides with the scraping grader, should be spread upon the clay and carefully leveled. The road must then be harrowed again (a disc harrow is preferable) until the sand is uniformly covered with the clay, when the road will again be rolled until thoroughly compacted and hard, and everywhere five inches below the grade and section of the completed road. This mixing can be done much better when the clay is thoroughly wet.

The clay course is then covered with a layer of gravel of such thickness as will make a uniform depth of five inches after compacting, or six inches loose measure. The gravel must be clean bank gravel, not less than 60 per cent by weight of which should be pebbles retained on a screen of $\frac{1}{8}$ inch and passing a screen of $1\frac{1}{2}$ inch mesh. The gravel should contain not more than 20 per cent of clay, otherwise it will form mud. The gravel course is then harrowed with a spike-tooth harrow and rolled until no further compacting is possible; the final rolling being done while the road is well wet from sprinkling it after rains. Any hollows which may develop during rolling

must be filled with the same kind of gravel, and the road kept properly crowned with a grader or drag and the rolling continued until the entire surface is uniform and hard and everywhere conforms to the proposed grade and cross section.

Rolling must at all times begin at the sides of the road, rolling lengthwise but gradually working toward the center. The shoulders are to be smoothed where necessary so that the whole roadway shall be in good surface and so that water will flow from it into the side ditches without obstruction.

GRAVEL ROADS

The inner slope of the side ditches must be not steeper than 2 horizontal to one vertical and the outer slope not steeper than $1\frac{1}{2}$ horizontal to one vertical. In clay soils trenches must be cut through the shoulders to furnish outlets into the side ditches for water that may collect in the gravel bed during construction and afterward before the surface becomes hard and waterproof. These trenches must be not more than 100 feet apart, must be 8 inches or more in width and slightly deeper than the gravel bed, and filled with coarse gravel when the first layer of gravel is being applied.

The sub-grade and shoulders are to be formed as provided for clay gravel roads. The sub-grade is then to be rolled, any hollows developing being filled with suitable material and rolling continued until the sub-grade is firm and everywhere parallel to the finished roadway and eight inches lower. A layer of gravel is then spread 6 inches deep (compacting to five inches); this gravel being good, clean bank gravel, not less than 60 per cent by weight of which is pebbles retained on a screen of $\frac{1}{8}$ -inch mesh and passing a screen of $2\frac{1}{2}$ -inch mesh. There should be no more than enough clay to coat the pebbles—no free lumps. This gravel is to be harrowed with a spike-tooth harrow and rolled until no further compacting is possible; this rolling being done only when the gravel is thoroughly wet. Depressions should be filled with the same material and rolling continued until the surface is uniformly smooth and hard and three inches below the finished surface.

The top course consists of clean gravel 60 per cent of which is retained on a $\frac{1}{8}$ -inch mesh and passes a $1\frac{1}{2}$ -inch mesh screen. This is spread about four inches thick (compacting to three inches) and is harrowed and rolled to a smooth hard surface. The rolling is to be done as specified for clay-gravel roads. It may be done with a power roller, a heavy horse roller, a traction engine followed by a weighted field roller, or by a weighted field roller alone if one of suitable strength to bear weighting to three or more tons can be obtained.

STONE-GRAVEL ROADS

These are prepared as to grading, drainage and side shoulders as for gravel roads. Then crushed stone or slag is spread to a uniform thickness of five inches (compacting to four inches); this being either crushed clag, limestone, cobbles or trap rock which has passed over the $\frac{3}{4}$ -inch section and through the 3-inch section of the crusher screen. Care should be taken to prevent the stone segregating, but the different sizes should be kept well mixed.

The stone or slag is to be rolled two or three times with a roller weighing not less than ten tons, after which it is to be covered to a uniform depth of from $\frac{1}{2}$ to $\frac{3}{4}$ inch with stone screenings or bank gravel, the amount of this binder being somewhat less than enough to fill the voids. This is then to be rolled, water being used sparingly, if it seems desirable, and the rolling continued until the binder is worked into the crevices of the larger stones and the stones cease to sink or creep beneath the roller. Stone screenings, which are preferable to gravel, may be that part of the crusher-product passing through the $\frac{3}{4}$ -inch section of the crusher screen. The gravel, if used, should be similar to that specified for top course of gravel road.

On the lower course will then be placed a layer of gravel four inches thick, to compress to three inches, this being similar to the gravel specified for the top course of gravel roads. This course is to be floated until the surface is smooth and even, then sprinkled and rolled until no further contracting is possible. Any hollows that may develop in the gravel top during the process of rolling are to be filled with the same kind of gravel and the rolling continued until the surface is uniform and hard, and everywhere conforms to the proposed grade and cross section of the road. The manner of rolling is that prescribed for the top course of other roads.

GRAVEL-STONE ROADS

The grading, drainage, shoulders, sub-grade and lower course of gravel are as specified for gravel roads. Instead of gravel, slag may be used for the lower course, this consisting only of that part of the crusher product passing over the one-inch section and through the three-inch section of the crusher screen; the slag being bonded with gravel or stone screenings smaller than one inch, and then being sprinkled and rolled.

On this is to be placed a layer of crushed stone 4 inches thick, to compress to 3 inches, the stone being crushed limestone, cobbles or trap rock, using only that part of the crusher product which passes over the $\frac{3}{4}$ -inch section and through the 2-inch section of the crusher screen. This stone must be placed on the road uniformly mixed, with no patches of alternately large and small stones. After this has been spread and rolled two or three times with a roller weighing not less than ten tons it is to be covered with $\frac{3}{4}$ inch of stone screenings. Enough screenings which have passed the $\frac{3}{4}$ -inch section of the crusher screen should be used to slightly more than fill the voids in the larger stones. Water is then to be applied with a horse sprinkler and the road rolled and watered until it becomes so hard that a piece of rock will crush beneath the roller before penetrating the surface. If depressions are formed they should be filled with the smaller stones of suitable grade and not with screenings. More screenings must be added, however, wherever these disappear from the surface in the road.

STONE ROADS

After grading the road and preparing the ditches, shoulders and sub-grade as previously, the first course is composed of a layer of crushed stone $4\frac{1}{2}$ inches deep, loose measure, to compress to $3\frac{1}{2}$ inches; which stone may be crushed limestone, cobbles or trap which has passed over the $\frac{3}{4}$ -inch section and through the 3-inch section of the crusher screen. This is then to be rolled two or three times and covered to a uniform depth of $\frac{1}{2}$ to $\frac{3}{4}$ inch with stone screenings and re-rolled; the amount of screenings being somewhat less than enough to fill the voids in the stone. The rolling must continue until the binder is worked into the crevices of the larger stones and the stones cease to sink or creep beneath the roller. The top course will then be laid as specified for the top course of gravel-stone roads, except that the stone is placed $3\frac{1}{2}$ inches deep instead of 4 inches, and compressed to $2\frac{1}{2}$ inches instead of 3 inches. Binder is applied and the road rolled as previously specified.

About 7,000 miles, or approximately one-tenth of the total road mileage of Michigan, is surfaced with gravel. Since the state reward road law became operative there have been built about 350 miles of gravel roads approved by the Highway Department, which roads have cost ordinarily from \$1,000 to \$3,000 per mile. Gravel roads are popular in Michigan because they are durable and satisfactory; because they are easily built and easily repaired, requiring no expensive machinery; because the first cost is low; because they draw a relatively large state reward—frequently one-third or more of their cost; and because they are a labor proposition from start to finish and keep at home all the money spent in their construction.

In his annual report the highway commissioner gives instruction for the improvement or maintenance of unimproved sand roads, in which he states that moisture should be conserved in every way possible, especially by the liberal planting of shade trees, particularly on the south and west sides of the roadway. Temporary relief can be had by covering the roadway with

straw, sawdust, shavings, cedar bark, leaves or almost any kind of vegetable matter. Such material forms a temporary covering which wheels cannot easily cut through, and conserves the moisture. Frequent scraping of sand roads with a road grader or other scraper is not only a loss of time and money, but is a positive injury, as it only helps the wheels to cut into it that much deeper. In short, except for the application of vegetable matter, as above suggested, a sand road is best left to care for itself until it can be covered with clay, gravel or macadam.

In caring for clay roads or any soil which will pack under travel and become reasonably firm in dry weather, they should be properly crowned and thoroughly drained, even to the extent of using tile drains to remove ground water. After having been drained and graded and crowned, the log drag or plank float is sufficient to keep them in good condition. The drag should be used in the spring when the frost has left the ground and the road has begun to dry out but is still muddy. It should also be used after every prolonged rain throughout the season, and in the fall just before the ground freezes. Also if the frost should leave the ground at any time during the winter advantage should be taken of this to use the drag to smooth out the ruts.

ROAD WORK IN MASSACHUSETTS

Surface Treatment Recommended for Light Traffic—Heavy Oils Heated for Surface Preservation—Oil and Sand "Building-Up" Process

DURING the year 1910 the Massachusetts Highway Commission built 54.5 miles of road, 18 of which was waterbound macadam, about 15 was gravel with the top course bound with bituminous material, 7 was sand bound with oil, 6 was gravel, and $2\frac{1}{2}$ was bituminous macadam with a surface binder of asphaltic oil.

Nearly a half million dollars was spent in maintenance of roads, including oiling. Many miles of roads have been successfully maintained in the last two years by a surface treatment of tar or asphaltic oil and Commissioner Parker and Chief Engineer A. W. Dean believe that this method of treatment will keep the roads in good condition where traffic is light. But without some such treatment many of the macadam roads are found to go to pieces in less than a year. It is believed therefore that bituminous surface treatment will be necessary over a large percentage of the State roads. This treatment costs from \$500 to \$1,200 per mile, depending upon the width of roadway treated and the condition of the road, and the length of haul for both bituminous material and metal. During 1910 more than 1,300,000 gallons of various tars, tarvias and asphaltic oils were used in maintenance and construction on about 250 miles of road. Of this length 219 miles was given a bituminous surface coat, and a bituminous binder was used in the top surface of 30 miles.

One method adopted by the Commission for using asphaltic oils was to heat sand or gravel, mix it with the oil and spread it upon a road which had been prepared by shaping and rolling. In other cases the so-called "building up" process has been used, in which the oil is heated before being applied and then about $\frac{3}{4}$ -gallon per square yard is applied to the dressed surface of the road and is covered with as much sand as is required to absorb all the oil. Another coating of the same amount is then applied and this again covered with sand. It seems to be difficult to secure perfect uniformity in this work, probably because of uneven distribution of the oil, and holes or irregularities appear in the surface which make it necessary to reshape the road, in places adding more oil and sand and rolling the whole to a firm surface again. This reshaping is usually left for the second season. This method has enabled the commission to prepare a fairly satisfactory road at a much less cost than that of a stone or gravel road, especially where such materials are not to be found near by. Where travel is light and gravel or stone can be obtained only by long hauls, a

built-up road costs only one-half to one-third as much as a macadam, and can be shaped from time to time with less difficulty than can a clay road, and will give quite satisfactory service. The same method of construction has also been found to give excellent results where gravel which is obtainable is of a loose and sandy nature and does not cement together readily. The oldest road of this construction was one built in Eastham in 1905. Ruts have occasionally developed in this road and holes worn in the top surface, but it has been reshaped from time to time by harrowing, scraping and rolling and each year has improved in condition, the asphaltic oil seeming to retain its adhesiveness. The cost of this road for the five years has been about 17 cents for original construction and 19½ cents for maintenance, or a total cost of \$3,400 per mile 16 feet wide. The commission in its report pays special attention to this class of road because it will enable localities where either absence or suitable material or lightness of travel make a macadam road too expensive to provide a fairly satisfactory road at much less cost.

The commission believes from its experience that the surface application of oil is to be recommended for dust suppression, but that to preserve the surface from wear a heavy bituminous material should be used and heated before application. It is found that where this material contains a large percentage of asphalt all the dust and dirt should be thoroughly removed from the surface of the road before application and the stones should not be extremely dry but should be rather moist, otherwise the oil will not adhere to the road metal. Two coats of one-quarter gallon per square yard each will produce more uniform and durable results than one coat of one-half gallon. A few days should elapse between the two applications. The commission has tested some English machines for distributing oil under pressure and believes that, while the penetration is not increased to any great extent by their use, the distribution is much more uniform, and it prefers this method to allowing the oil to flow on by gravity.

Most of the oil used last year by the commission was purchased under the following specifications:

The oil should be of a uniform color, appearance, general character and viscosity and must fulfill the following requirements:

- a. It shall have a specific gravity of at least 0.97.
- b. It shall contain not over 0.5 per cent of dirt or adventitious mineral matter.
- c. It shall contain not over one per cent of matter insoluble in carbon bisulphide.
- d. It shall be of such viscosity that 60 c.c. measured at room temperature (78 deg. Fahr.) shall when at 100 deg. C. be not less than 250 seconds nor more than 500 seconds in passing a Lawrence viscosimeter, or 200 c.c. measured and tested at the same temperature shall not be less than 900 seconds nor more than 1800 seconds in passing the Engler viscosimeter.
- e. When 20 grams are heated in a flat-bottomed dish 3 inches in diameter for 21 hours in a well-ventilated oven kept at a temperature of 250 deg. C. the loss in weight shall not be greater than 15 per cent.
- f. When subjected to a number of heatings at 250 deg. C. in a well-ventilated oven with intermediate separations of asphaltine and matter insoluble in carbon bisulphide until the final petroleum ether extract is not more than 10 per cent by weight of the original sample, it shall show the following results, assuming also that this final 10 per cent has the same composition as the 90 per cent of the material examined:

The total loss shall not be more than 35 per cent by weight; the amount of asphaltine in the original sample shall not be greater than 6 per cent by weight, and the amount of asphaltine formed by this treatment plus that in the original samples shall be at least 58 per cent by weight of the original sample. The amount of matter insoluble in carbon bisulphide as a result of this treatment shall not be greater than 5 per cent.

In applying oil the commission always treats one side of the road, and leaves the other untreated and open for traffic until the first has absorbed the oil and been put in such shape for traffic that the oil will not track or be objectionable in any way. While this commission has been systematically experimenting and noting results for a number of years, it is not confident that it or any one else either in this country or abroad can state with certainty what the final results will be from the

adoption of these comparatively new methods of treatment. It appears probable, however, that the cost of maintenance where these bituminous methods are employed will be no greater with the heavy automobile traffic than is the cost of maintaining water-bound macadam. It has been found both in United States and in England and on the continent that it costs from \$250 to \$600 per mile per year to properly maintain a macadam road in country districts and considerably more where the traffic is heavy.

OHIO STATE ROAD LABORATORY

The State Highway Department of Ohio, James C. Wonders commissioner, has a laboratory for testing road building materials which, while it is hampered by a small appropriation, is still a very creditable one. The equipment of the laboratory comprises a standard brick rattler, a Deval abrasion machine of four cylinders, Case jaw crusher, Ilers disc pulverizer, each of the above with its own motor. Also a stone shaker; diamond core drill; Page diamond saw; carborundum wheel grinder, with motor; Dorry grinding machine for hardness, with motor; sifter, with motor; hydraulic briquette molding machine; standard impact testing machine for toughness; trip-hammer model motor machine for cementing value; drying oven; scales, etc. The apparatus for cement testing consists of Riehle briquette machine, Vicat needle, Gilmore needles, gang molds, damp closet, specific gravity flasks, sand scales, etc. That for bituminous materials: One analytical balance, one New York testing laboratory penetrometer, one Engler viscosimeter, one Westpals specific gravity balance, one electric oven, one sheet steel asphalt heater and mixer, brass mold and asphalt flow plates, one closed flash tester, three hydrometers, four thermometers, three dissicators, and accessories such as platinum and porcelain crucibles, flasks, graduates, funnels, piquettes, etc.

The tests made for brick are the abrasion or rattler test, and that for absorption. The stone is tested for abrasion, hardness, toughness, slaking, cementing value, absorption and specific gravity. In testing cement the specific gravity, fineness, setting qualities, soundness and tensile strength are ascertained. The tests for bituminous materials are for specific gravity, water-soluble material, viscosity at 25 degrees C. and 100 degrees C., loss on heating five hours at 170 degrees C., loss on heating five hours at 205 degrees C., penetration of residue (from above evaporations), melting point of normal material, melting point of residue (from above evaporations), fixed carbon, ash, solubility in carbon disulphide, solubility in carbon tetrachloride, solubility in naphtha, percentage of paraffine scale present, fire point, percentage of coke left upon distillation, and special tests.

MISSOURI'S DIVERSIFIED ROADS

While most of the roads in New England are of hard rock macadam, many of those in the Carolinas are of sand clay and most of the States or sections have their own peculiar kind of road, depending upon the geological features. Missouri, for the same reason, has adopted many kinds of roads in different sections of the State: sand, clay, gumbo, chert, gravel and different kinds of rock being the different materials available. Among the rocks used is the so-called "silica," which is a local name for a rotten rock running high in silica found in Cape Girardeau county and vicinity and which makes excellent roads for light or medium travel. Chert, gravel and rock are found in Green county, and each of these is used where most accessible. Convicts furnish the labor to a large extent, especially on the stone macadam roads. In St. Louis county most of the roads are macadam or Telford macadam. There are hundreds of miles of river bottom lands where sand and gumbo mixed seem to be the only practicable road material, and excellent roads for farm wagons have been constructed with them on the principle of the sand clay roads.

STREET WORK IN MADISON, WIS.

Tar Bound Macadam Petitioned for—Protecting Gutters while
Applying Oil—Oiling Lessens Cost of Cleaning
Catch Basins

DURING the year 1910, in the city of Madison, Wis., the citizens on at least two streets were so desirous of obtaining a street paving in front of their property which would be less dusty than the ordinary macadam, that they petitioned that the contracts for ordinary macadam, which had already been let, be changed so as to provide for using bituminous binder in the upper two inches, offering to stand the additional expense involved. In one of these, tar was used as a binder and in the other, asphalt. City Engineer John F. Icke says in his report: "The contractor took particular pains to get a good job and as a result we have the best tar-bound macadam thus far built in the city." The additional cost of the tar over the original contract price for water-bound macadam was about 28½ cents per square yard. We imagine that this would probably have been less if it had not been added as an extra to the original contract, this being the common experience as to extras in most cases.

The contracts for asphalt pavement last year provided for a five-year guarantee period and the retention of 10 per cent of the contract price as a guarantee, the company receiving 4 per cent interest on the money so retained. Concerning this Mr. Icke says, "I think the provision in the contract for the retention of a definite sum of money is a wholesome one and far superior to the guarantee of any surety company, especially in the matter of getting good results when it becomes necessary to make any repairs under the guarantee."

Street trees are now planted as a part of the permanent street work, in certain cases, at least. On West Washington Avenue are trees which have been in during three seasons, and owing to the efforts of the Park Department nearly all interfering trees on this street have been removed and in a few years the avenue will present an object lesson in the shape of a continuous arch of elm trees throughout the length so planted.

In 1910 oil was tried for the first time in Madison as a dust layer on macadam roads. It was purchased in tank-car lots at 4¼ cents per gallon, F. O. B. Madison. Any depressions were filled with crushed stone and rolled with the steam roller about a month before the oil was applied. The best results were obtained on streets where the macadam was in good condition or on those washed clean after a heavy rain. One idea which we believe is not common but which would seem worthy of trial elsewhere, was that of cleaning the surface of the macadam by sweeping all the dust into the gutter, where it was left until after the oil had been applied. The dust thus served to protect the curb from disfigurement by the oil and also to absorb that which flowed into the gutter, thus avoiding the unsightly and unpleasant pools of oil so frequently found along the sides of freshly oiled roads. In some cases the sweepings were thrown back onto the road, while in others they were removed from the gutters after the oil had stopped running off the surface. The tank cars were placed on a siding, which is on an embankment, thus making it possible to unload the oil from the tank cars into the oil sprinkling wagon by gravity. The oil was heated to about 150 degrees before being run out of the tank cars, this being effected by steam supplied by a traction engine owned by the city, which was run along side of the tank car and connected with it.

Concerning the use of oil the city engineer's annual report says:

"The short time that we have used oil on our macadam has shown how effective it is as a dust layer and as a protector to our macadam. One of the heaviest rains last season followed shortly after we had applied some of the oil. The rain did nothing more than to wash the oiled surface clean, but along the edges of the gutter and on the streets where no oil had been applied, the screenings were washed away, exposing the crushed stone.

"The cost of cleaning catch basins on the oiled streets has been materially lessened, as the rains no longer can erode the macadam and wash it into the basins. The heavy demand upon the water works system during the sprinkling season will be decreased materially, which in itself will be a great benefit.

"In order to get the best results we have learned that the macadam should be swept thoroughly, exposing the sharp edges of the stone; that the oil should be applied in warm weather; that traffic should be kept off from the streets until the oil has been practically all absorbed; that the gutters should be well covered with screenings to prevent the oil from spreading over them and soiling them."

ROAD IMPROVEMENTS IN WEST VIRGINIA

A State Department of Public Roads was created in West Virginia in 1909. The first work of the commissioner was to hold public meetings in order to inform the people concerning the aims of the department and to arouse interest in its work. It was also necessary to prepare standards for maps, plans, contracts and specifications; also to aid the county road engineers in systematizing their work and improving the standard of maintenance, at the same time reducing the cost. A meeting of the county road engineers was held in December, 1909, at which more than forty counties were represented. Previous to this it had been decided to establish the standard scale for county maps at 4,000 feet to the inch, these to show the districts, important towns, railroads, streams and all public roads. In addition standard plans are provided for having a scale of 100 feet to the inch for recording surveys of public roads.

OLD AND IMPROVED ROADS IN WEST VIRGINIA

The law of 1909 required each county to appoint a road engineer, and so far only one county has not met this requirement. By the end of 1910 2,454 miles of county roads had been surveyed, 12,371 miles had been measured, and maps had been made of 18 counties.

In addition to this preliminary work some actual road improvement has been performed. The accompanying illustration, showing a section of the original road running off to the left, gives a good idea of the necessity for improving both the grades of the roads and the general character of the same in many of the mountain districts of this State.

An idea of the preliminary construction work being done may be given by the report for Fayette county. This county has an area of 730 square miles and contains about 933 miles of public roads. "The roads in Fayette are being completely overhauled, consisting of cutting the brush and weeds, blasting out the ridges of rock that cross the roads in so many places, opening up good side ditches and crowning the roads well, so they can be maintained with the road drag. Seven miles radiating from Fayetteville are being worked with convicts at a cost of \$25 per mile, and 475 miles have been let by contract at an average cost of \$75 per mile. The remainder of the roads are being kept up by the supervisors working under the county road engineer. Three and a half miles of road will be constructed with convicts. The maximum grade of the present road is 16¾ per cent and the maximum grade of the new road will be 5 per cent."

OIL MACADAM SPECIFICATIONS

We have received from J. B. Marcellus, of Boise, Idaho, the tabulation given below of the principal items of the specifications for oil macadam pavement used by several California cities, the State of New Jersey and the City of Boise. In some respects the several specifications are seen to be very similar, but in others quite dissimilar. The placing of the pavement upon rolled earth as a foundation is quite common, and the use of a ten-ton roller for rolling. The thickness of the pave-

ment, however, varies from 3/4 inch to 7 inches. The size of material used in the top stone varies from between dust and 1/2 inch as a minimum, to from 1/2 to 1 1/2 inches as a maximum. The total amount of oil used per square yard also is quite variable, the maximum being 3/4 gallon and the minimum 3/8 gallons. Asphalt oil, 70% to 90%, is required by all except the New Jersey specifications. The other similarities and differences are quite apparent from an inspection of the table.

COMPARISON OF CERTAIN SPECIFICATIONS FOR OIL MACADAM PAVEMENT

City.	Foundation.	Roller.	Final Thickness of Pavement	FIRST COURSE.		SECOND COURSE.		TOP COURSE.	
				Size Stone.	Thickness.	Size Stone.	Thickness.	Size Stone.	Thickne s.
Long Beach.....	Rolled Earth	10 ton	5"	3/4" to 3"	2 1/2"	3/4" to 2"	2"	1/4" to 3/4"	1/2"
Los Angeles.....	Rolled Earth	10 ton	According to amount of traffic.	1 1/2" to 3"	..	3/4" to 1 1/2"	..	1/4" to 3/4"	..
San Monica.....	Earth mixed with oil—3 mixings.	250 lbs. per in.	2" to 4" of gravel	(See Foundation)		Dust to 1"	1 1/2"	Dust to 1/2"	1/2"
Berkerly.....	Rolled Earth	250 lbs. per in.	3/4"	Earth subgrade raveled with harrow then 3/4" layer of gravel.		0" to 1/2"	1/2"
Santa Barbara.....	Rolled Earth	10 ton	5" at gutter 7" at crown	1 1/2" to 2 1/2" with screenings	3" (gutter) 5" (crown)	1/2" to 1 1/2" and screenings	2" (gutter) 3" (crown)
Bakersfield.....	Rolled Earth	10 ton	2" at gutter 3 1/2" at crown	Earth pulverized for 6" below gravel.		1/2" to 3"	2" (gutter) 3 1/2" (crown)	1/2" pea gravel	..
Sacramento.....	Rolled Earth	300 lbs. per in.	6"	1 1/4"-2 1/2" with screening and water	4"	3/4"-1 1/2" with screenings and water	2"	Screenings and sand to fill voids.	
New Jersey (state)....	Rolled Earth	10 ton	..	2" to 3" with screenings	..	1" to 2" with sand to fill 50% of voids	..	3/4" 50% Dust 50%	..
Boise.....	Rolled Earth	10 ton	6"	1 1/4" to 2 1/2" with screenings and water	4"	3/4" to 1 1/4" with screenings and water	1 1/2"	1/4" to 3/4" with screenings and water	1/2"

COMPARISON OF CERTAIN SPECIFICATIONS FOR OIL MACADAM PAVEMENT—(Continued)

City.	OIL				Amount Rolling.	Remarks.
	Temp.	Character.	Total Amount.	How Applied.		
Long Beach.....	+175°	90% asphalt S.G. 10°-11° B.	1 1/2 gal. per sq. yd.	1 gal. on 2nd course 1/2 gal. on top course	Unyielding Sprinkle each course	Lay undisturbed 48 hrs. before top course is added

ROAD METHODS IN GREAT BRITAIN

Road Board "Directions and Specifications" for Surface Tarring, Tar Macadam and Pitch Grouted Macadam
—Specifications for Tars from Gas Works and Tar Distillers, Pitch and Tar Oils

THE ROAD Board of Great Britain has just made public "general directions and specifications" prepared for it by its advisory engineering committee, which probably contains the latest authoritative conclusions derived from several years' experience and experiments in that country. These are divided into six heads, the titles of which are: "General Directions for Surface Tarring," "General Directions for Surfacing with Tar Macadam," "General Directions for Surfacing with Pitch-Grouted Macadam," "Specifications for Tar No. 1," "Specifications for Tar No. 2," "Specifications for Pitch."

These specifications and directions are of such importance that, although in certain respects, chiefly that of climate, conditions are different in Great Britain from those in this country, it seems worth while to reproduce them; omitting certain sections which are of local application, which are duplicated in the several sections, or which are generally recognized in this country as common and desirable practice. In connection with differences of climate it may be mentioned that the differences between England and the north Atlantic sea board of this country is probably less than that between the eastern and the western or between the northern and the southern sections of the United States. The selected portions of the Road Board's Report are as follows:

NO. 1.—GENERAL DIRECTIONS FOR SURFACE TARRING

1. Surface tarring may be advantageously applied either to an old road surface in good condition or to a new surface after it has been consolidated and dried, but the tarring should never be carried out unless the road is thoroughly dry.

If there are any depressions, pot-holes, waves, grooves, or other irregularities, these should as far as practicable be made good before tarring is commenced, so as to provide an even surface.

2. Painting and spraying machines get through the work of tarring more rapidly than application by hand, and consequently are to be recommended; but hand work gives satisfactory results, and the selection of the method to be employed must be largely determined by the available supply of efficient labor.

3. If it is intended to tar an old surface it is advisable to take advantage of the early months of the year to scrape or brush the road during wet weather as a preparation for subsequent tarring, and especially to keep the road free from caked mud.

6. The road while being tarred should be closed to traffic over half its width, or, where practicable, over its whole width.

7. The road should be thoroughly brushed and cleaned before application of the tar. Wet brushing should be used some time previous to dry brushing, if there is any caked mud. Any method of brushing may be used which will scour and clean the road thoroughly, the best being horse brushing, followed by hand brushing.

9. The tar should be heated to its boiling point at convenient positions on the works, and should be applied as hot as possible, so that it may flow freely. The desired temperature will be generally found in practice to lie between 220 deg. and 240 deg. Fahr. for Tar No. 1 and between 260 deg. and 280 deg. Fahr. for Tar No. 2.

10. In order that the tar should be applied to the road as hot as possible, it is advisable, if the method of application is by hand, to use flexible pipes to convey the tar from the boiler to the point of application. If these are not available, it will be found convenient in case of hand-pouring to use 3-gallon cans specially constructed for the purpose, fitted with spouts leading direct from the bottom of the cans, and being not less than 1½ inches in diameter at the orifice.

11. Immediately on application the liquid tar should be brushed so far as necessary, to ensure regularity in thickness of the coating.

12. The quantity of tar required will vary according to the physical conditions of the road, but generally, in the case of a road to be treated with tar for the first time, the quantity should be one gallon to coat from 5 to 7 square yards.

13. If the road must be opened for traffic before the tar has set hard, grit should be spread on the surface to prevent the tar from adhering to the wheels of vehicles, but gritting should be delayed as long as possible, and the quantity of grit-

ting material to be spread should be no more than sufficient to prevent the tar from adhering to wheels. Stone chippings, crushed gravel, coarse sand, or other approved material (free from dust) not larger than will pass through a ¼-inch square mesh should be used for gritting, in quantity not exceeding one ton for 300 to 350 square yards if grit is used, and one ton for 200 to 250 square yards if coarse sand is used.

Caution—While Tarring in Progress Cyclists Advised to Walk

It is specially desirable to place warning notices at points in the neighborhood of the work where other roads join or cross the road being tarred, to enable motorists and cyclists to avoid the obstructed road by taking any available alternative route.

16. On heavily traveled roads it is advisable to apply a second coat to either the whole width, or from 9 to 12 ft. of the centre of the road, in quantity of one gallon to coat from 8 to 10 yards square about two to three months after the first application.

17. Surface tarring should be renewed annually on all important roads, and as required on roads with light traffic. On such recoatings the quantity of tar to be applied will vary with the extent to which the previous coating of tar has been removed by weather or by traffic.

18. Two or more samples of the tar used should in all cases be kept in quart tin cans, and be carefully labelled, including particulars fixing the locality or length of the road on which the tar was used. The Road Board will arrange with the National Physical Laboratory to submit a selection of these samples to a series of chemical and physical tests with a view to the results being recorded for future reference, and surveyors will from time to time be invited to send samples for the purpose.

19. In all cases careful record should be kept of the condition of the road surfaces in winter and summer, both before and after tarring, the quantity and quality of tar used, the superficial area covered, the state of the weather when the work is being done, the time occupied in actual work and in waiting while work is stopped owing to wet weather, the number of men employed, and full details of the cost of labor and material.

20. Surveyors are invited to send records to the Road Board to be classified and published for general information. Forms for these records will be supplied by the Board.

NO. 2.—GENERAL DIRECTIONS FOR SURFACING WITH TAR
MACADAM

1. Any road which is to be surfaced with tar macadam should have a proper foundation or sub-crust of adequate thickness to bear the traffic likely to use it.

2. Before laying a new surface of tar macadam the thickness of the old crust, including foundation, should be ascertained by opening trial trenches at intervals averaging about 150 yards, extending from the haunch of the road to the centre, such trenches to be made alternately on opposite sides of the road.

3. The thickness of the surface coating of tar macadam when consolidated by rolling should be from 2 to 3 inches, according to traffic requirements. For a greater thickness than 3 inches the material should be applied in two coats.

4. In the case of naturally hard sub-soils, not materially softened by infiltration of surface water, the total thickness of the road crust, including foundation, if any, after consolidation of the new surface of tar macadam by rolling, should not under ordinary circumstances be less than 6 inches, unless the sub-soil is so hard as in itself to act as a good foundation, in which case the thickness of the road crust may be reduced to 4 inches. In the case of clay or other yielding sub-soils the total thickness should not be less than 11 inches.

5. The finished surface should have a cross-fall of about 1 in 32.

If the crust is not sufficiently thick at the crown to enable this cross-fall to be obtained with a new coating of the thickness above mentioned, then the old surface should be left intact and unscarified and the thickness of the new coat of tar macadam increased as far as may be necessary.

If the crust is of sufficient thickness for the purpose, the regulation of the cross-fall should be carried out by scarifying the surface and removing material from the crown to the sides previous to the application of the new coating. The material loosened by scarifying should be screened and all finer material than ½ inch should be thrown aside.

6. The aggregate of the new surface of tar macadam should be composed of broken stone of approved quality, or selected slag of approved quality, and should contain at least 60 per cent. broken to the size of $2\frac{1}{2}$ inches, not more than 30 per cent. of from $2\frac{1}{2}$ to $1\frac{1}{4}$ inches, and 10 per cent. of $\frac{3}{4}$ to $\frac{1}{2}$ inches for closing. The last mentioned size should be kept separate and used as top dressing during rolling operations.

7. The stone used must be thoroughly dried before being coated with tar.

8. For making tar macadam, tar should be used which complies with Road Board Specification Tar No. 1, or Road Board Specification Tar No. 2, the choice being determined by the circumstances of each case.

If Tar No. 1 has been used for tarring the stone, care should be taken, especially in hot weather, that the tarred material has been allowed to stand for a sufficient length of time to allow the tarred surface of the stones to become partially hardened and in a tacky condition.

If Tar No. 2 has been used for tarring the stone, the macadam should be laid soon after being tarred, and if the tar be of the heavier grade of this quality, the stone coated with such tar should only be laid when the road is quite dry and in warm, sunny weather.

9. The quantity of tar used to coat one ton of stone should be approximately from 9 to 12 gallons, varying according to the sizes of the stone, the grade of tar used, the method of mixing and other conditions.

10. The tar-macadam, after having been spread and levelled, should be rolled into a smooth surface, but too much rolling should be avoided.

Less rolling is required than in the case of water-bound macadam.

A ten-ton roller is a suitable size for use in most cases, but good results can be obtained by using a six-ton roller and finishing with a ten-ton roller.

11. In order to get the best results from the use of tar macadam, it is advisable to apply a coating of tar to the surface after the road has been used by traffic for several weeks. This tar should comply with the provisions of Road Board Specification for Tar No. 2, and should be poured or sprayed on the surface at a temperature of about 270 deg. Fahr.

12. Stone chippings, crushed gravel, coarse sand, or other approved material (free from dust), not larger than will pass through a $\frac{1}{4}$ -inch square mesh, should be used for gritting in quantity not exceeding one ton for 350 to 400 square yards if grit is used and one ton for 200 to 250 square yards if coarse sand is used.

NOTE.—These general directions are not intended to displace or to discourage the use of proprietary articles, of which there are several of proved value.

No. 3.—GENERAL DIRECTIONS FOR SURFACING WITH PITCH-GROUTED MACADAM

3. The thickness of the surface coating of pitch-grouted macadam when finished and consolidated by rolling should be $2\frac{1}{2}$ to 3 inches (except on very light-traffic roads, when the thickness may be 2 inches) for single-pitch grouting, and from 4 to $4\frac{1}{2}$ inches for the double-pitch grouting hereafter described.

8. It is important that the pitch should not be poured if the surface of the stone is wet. The stone may be protected by tarpaulins, or, if wet, may be dried *in situ* by portable blowers, or other means.

9. The quantity of pitch required to grout a single coating is approximately, for a consolidated thickness of 2 inches, $1\frac{1}{4}$ gallons per yard square; for $2\frac{1}{2}$ inches, $1\frac{1}{2}$ gallons per yard square, and for 3 inches, 2 gallons per yard square; but these quantities may vary with different materials, and care must always be taken to fill the voids adequately.

10. The aggregate after having been spread must be rolled down dry until the surface is formed, but without the addition of any small material.

11. The pitch, after being carefully melted, as described in Clause 18, must be raised to a temperature of 300 deg. Fahr. Clean, sharp sand must be heated on sand heaters to a temperature of 400 deg. Fahr. A dandy, or portable mixing vessel, is then to be filled with equal parts, by measurement, of the heated pitch and the hot sand, and the mixture, hereafter called the matrix, is to be kept well stirred while it is being emptied from the dandy or portable mixing vessel into pouring cans of from 2 to 3 gallons capacity, which are used for pouring matrix onto the roadway. Not only during the process of mixing, but afterwards, right up to the time of actual pouring, the matrix must be kept well stirred. The matrix prepared with pitch in the quantities specified in Clause 9 should be sufficient to fill the voids of the aggregate.

12. The final rolling should be commenced immediately after pouring the pitch matrix, and carried on rapidly before the matrix has time to set. The 5 per cent. of graded chippings should be spread over the grouted surface in part pre-

viously to and the remainder during the process of rolling. The traffic may be allowed onto the finished surfaced as soon as the surface has cooled to the normal temperature.

Double Pitch-Grouting

13. When the traffic is so heavy that a consolidated thickness of from 4 to $4\frac{1}{2}$ inches of pitch-grouted macadam is required, it is desirable, in order to obtain the best and most economical results, to divide the coating into two layers, the bottom layer to be the thicker one and to consist of large stones, the two layers being rolled down and grouted separately. Any local stone which can be procured cheaply may, if suitable in quality for foundation work, be used for the bottom layer graded from 3-inch gauge down to 2-inch gauge. No chippings are required for finishing the rolling of the bottom layer. The aggregate for the upper layer should consist of hard road stone of approved wearing quality, broken to $1\frac{1}{2}$ -inch gauge, and 5 per cent. of chippings of the same stone used for the upper layer, graded from $\frac{1}{2}$ inch down to $\frac{3}{4}$ inch, should be added before and during the process of rolling, and rolled down so as to form the finished surface of the road.

14. In pouring the pitch on the bottom layer the surface of the pitch should not be brought to the surface of the stone, but should lie about $\frac{1}{2}$ inch below such surface, with the object of providing a key for the upper layer.

16. The quantity of pitch required for double pitch-grouting is approximately, for a considerable thickness of 4 inches, $3\frac{1}{4}$ gallons per yard square, and for $4\frac{1}{2}$, $3\frac{1}{2}$ gallons per yard square; but these quantities may vary with different materials, and care must always be taken to fill the voids in the surface coating adequately.

17. For the purpose of accurately ascertaining the proportions necessary for the matrix, it is essential that portable weights, scales and measures be provided, and all materials used in the preparation of the matrix should be accurately proportioned by weight or measurement.

Instructions for Melting the Pitch

18. The pitch boilers of from 2 to 3 tons capacity should be charged with pitch and about one-half of the proper proportion of tar oils. The fire should then be lighted, and thereafter a steady fire, with fire doors closed, should be maintained, when, in from four or five hours, the pitch should be thoroughly melted. A bright fire should be kept until the pitch reaches a temperature of 300 deg. Fahr., when the remainder of the oils should be added, and the mixture thoroughly stirred; the fire doors should then be opened and the temperature of the melted pitch permitted to fall to 250 deg., or 270 deg. Fahr. The pitch should then be ready for use, and in all cases should be thoroughly well stirred before being drawn off.

In the event of bad weather stopping the work of grouting, the fire door should be left open, the damper closed and the temperature of the pitch allowed to fall to 200 deg. Fahr. It can be kept at this temperature for long periods with banked fires consuming 7 lbs. of coke per hour.

It is recommended that a suitable Fahrenheit thermometer with metal protection should be at hand to indicate the temperature of the melted pitch. Whenever the weather is favorable for the recommencement of the work the pitch must be again raised to 270 deg. Fahr. by closing the doors and sharp firing.

It is desirable that the boiler should be kept air-tight when the pitch is being melted, by the use of air-tight covers properly packed, so as to make an air-tight joint.

NOTE.—These general directions are not intended to displace or to discourage the use of proprietary articles, of which there are several of proved value.

No. 4.—SPECIFICATIONS FOR TAR NO. 1

1. *General*—This tar is suitable for the surface tarring of roads.

As to the use of this tar for making tar macadam, see "Road Board's General Directions for Surfacing with Tar macadam."

2. *Boiling*. The tar should be applied as soon as the boiling point is reached, and over-boiling should be avoided. The desired temperature will be generally found in practice to lie between 220 deg. and 240 deg. Fahr. in the boiler.

3. *Source of Tar*. The tar shall be derived wholly from the carbonization of bituminous coal, except that it may contain not more than 10 per cent. of its volume of the tar (or distillates or pitch therefrom) produced in the manufacture of carburetted water gas.

4. *Specific Gravity*. The specific gravity of the tar at 15 deg. C. (59 deg. Fahr.) shall be as nearly as possible 1.19, but in view of the great variation in specific gravity of the tars produced in various parts of the country, the specific gravity may be as low as 1.16, or as high as 1.22, provided that in other respects it complies with the provisions of the specification.

5. *Freedom from Water*. The tar shall be commercially free from water—i. e., it shall not contain more than one per

cent. by volume of water or ammoniacal liquor, which water or liquor (if present) shall not contain more ammonia, free or combined, than corresponds to 5 grains of ammonia per gallon (= 70 milligrammes per litre) of the tar.

6. *Phenols.* On vigorous agitation for a quarter of an hour with twenty times its volume of water at 21 deg. C. (70 deg. Fahr.), the tar shall not impart to the water more than 5 grains of phenoloid bodies, reckoned as phenol, per gallon of water (= 70 milligrammes per litre).

Tar from Gasworks

The provisions in the following Clause 7, 8 and 9 apply to tar supplied direct from gasworks.

7. *Source of Tar.* The tar shall be solely the natural by-product of the manufacture of illuminating gas (coal-gas with or without admixture of carburetted water gas), and shall have been subjected to no other or further treatment than may be necessary for the abstraction of water or ammoniacal liquor and light oils.

8. *Fractionation.* On distillation the tar must yield, below 170 deg. C., not more than one per cent, and between 170 deg. C. and 270 deg. C., not less than 16 per cent and not more than 26 per cent of distillate (exclusive of water).

9. *Free Carbon.* The free carbon shall not exceed 16 per cent of the weight of the tar.

Tar from Tar Distilleries

The provisions in the following Clauses 10 and 11 apply to tar supplied from tar distilleries.

10. *Fractionation.* On distillation the tar must yield, below 170 deg. C., not more than one per cent, and between 170 deg. C. and 270 deg. C. not more than 26 per cent of distillate (exclusive of water). The distillate shall remain clear and free from solid matter (crystals of naphthalene, etc.) when maintained at a temperature of 30 deg. C. for half an hour. The distillation shall be continued to 300 deg. C. and the residual pitch thus obtained shall not amount to more than 73 per cent of the weight of the tar.

11. *Free Carbon.* The free carbon shall not exceed 16 per cent of the weight of the tar.

12. *Taking of Temperatures.* The temperature during distillation shall be taken by a thermometer of which the bulb shall be opposite the opening to the side tube of the distillation flask, and the quantities of distillates and free carbon shall be stated in percentages by weight of the portion of tar submitted to distillation.

13. *Dehydrated Tar.* A tar prepared by simple dehydration fulfilling the provisions of this specification may be used with satisfactory results in most cases, but tars from which the naphthalene has been extracted are superior for the purposes of surface tarring.

Note.—This specification is not intended to displace or to discourage the use of proprietary articles, of which there are several of proved value.

SPECIFICATION FOR TAR NO. 2

1. *General.* This tar is suitable for surface tarring, and is specially recommended for re-tarring; but if the heavier grades of the tar are used, care should be taken to apply it only when the road is dry and well warmed by the sun's rays, otherwise it will not flow freely.

As to the use of this tar for making tar macadam, see "Road Board General Directors for Surfacing with Tar Macadam."

2. *Boiling.* The tar is to be applied as soon as the boiling point is reached, and over-boiling should be avoided. The desired temperature will be generally found in practice to lie between 260 deg. and 280 deg. Fahr. in the boiler.

3. *Source of Tar.* The tar shall be derived wholly from the carbonization of bituminous coal, except that it may contain not more than 10 per cent of its volume of the tar (or distillates or pitch therefrom) produced in the manufacture of carburetted water gas.

If pitch be added to the tar in order to secure the specific gravity and proportion of residual pitch referred to below, the pitch so added must also have been derived from tar of the foregoing description.

If oil be added to heavy tar or pitch in order to secure the specific gravity and proportion of residue referred to below, the oil so added must be derived from tar of the foregoing description and must be practically free from naphthalene and tar acids or phenols.

4. *Specific Gravity.* The specific gravity of the tar at 15 deg. C. shall be as nearly as possible 1.21, and in no case shall it be lower than 1.18 or higher than 1.24.

5. *Phenols.* (Same as 6 of Specification for Tar No. 1.)

6. *Fractionation.* The tar shall be free from water and on distillation shall yield no distillate below 140 deg. C., nor more than 3 per cent of distillate up to 220 deg. C., which distillate shall remain clear and free from solid matter (crystals of naphthalene, etc.), when maintained at a temperature of 30 deg. C. for half an hour.

Between 140 deg. and 300 deg. C. it shall yield not less than 15 per cent, nor more than 21 per cent of the weight of the tar.

7. *Free Carbon.* The free carbon shall not exceed 18 per cent of the weight of the tar.

8. *Taking of Temperatures.* (Same as 12 of Specifications for Tar No. 1.)

Note.—This specification is not intended to displace or to discourage the use of proprietary articles, of which there are several of proved value.

SPECIFICATION FOR PITCH

1. *General.* This pitch is suitable for pitch-grouting. See "Road Board's General Directions for Pitch-grouting."

2. *Preparation.* The pitch is obtained by softening the material known as commercial soft pitch, as specified below, by the addition of tar oils, also specified below.

COMMERCIAL SOFT PITCH

3. *Source of Pitch.* The pitch shall be derived wholly from tar produced in the carbonization of bituminous coal, except that it may contain not more than 10 per cent of pitch derived from tar produced in the manufacture of carburetted water gas.

4. *Fractionation.* On distillation the pitch shall yield, below 270 deg. C., not more than one per cent of distillate; between 270 deg. C. and 315 deg. C., not less than 2 per cent and not more than 5 per cent of distillate.

5. *Free Carbon.* The free carbon should not exceed 22 per cent of the weight of the pitch, but if it be found difficult or unduly expensive to obtain this quality of pitch, a quality containing as much as 28 per cent of free carbon may be used with a reduced proportion of sand as filler.

6. *Taking of Temperatures.* (Same as 12 of Specifications for Tar No. 1.)

TAR OILS

7. *General.* The tar oils to be used shall be derived wholly from tar produced in the carbonization of bituminous coal, or from such tar mixed with not more than 10 per cent of its volume of tar produced in the manufacture of carburetted water gas.

8. *Specific Gravity.* The specific gravity of the tar oil at 20 deg. C. shall lie between 1.065 and 1.075.

9. *Freedom from Naphthalene.* The tar oils after standing for half an hour at 20 deg. C. shall remain clear and free from solid matter (crystals of naphthalene, etc.).

10. *Fractionation.* The tar oils shall be commercially free from light oils and water—i. e., on distillation shall yield not more than one per cent of distillate below 140 deg. C.

The amount of distillate between 140 deg. C. and 270 deg. C. shall lie between 30 per cent and 50 per cent.

11. *Taking of Temperatures.* (Same as 12 of Specifications for Tar No. 1.)

12. *Proportions.* The proportions by weight in which the pitch and tar oils are to be mixed shall be as follows:

Pitch 88 per cent to 90 per cent.

Tar oils 10 per cent to 12 per cent.

Note.—This specification is not intended to displace or to discourage the use of proprietary articles, of which there are several of proved value.

ROAD IMPROVEMENT IN NOVA SCOTIA

NOVA SCOTIA possesses, according to official figures, some 18,000 miles of highways, divided into road districts much as in the United States, and under the superintendence of the road commissioner of the Province. Of this total it is estimated that 10,000 miles are fairly good road for driving and automobiling, and every year many miles of graveled road are being added. During the year ended September 30, 1910, work to the amount of \$163,512 was done, and other work undertaken or mapped out, calling for an additional expenditure of \$21,951. This aggregated an outlay of approximately \$185,463 per county, which is about the usual average in this Province.

The revenue for road repair in Nova Scotia is derived from taxes upon property (a certain per cent of the whole going to the road fund) and from a poll tax, these being paid either in cash or labor at the prevailing wage rate per diem. The property tax for the fiscal year 1910 amounted to about \$95,000 in the 18 counties of the Province, and the poll tax to more than \$80,000, making a total of \$175,000, and this was pro rated among the several counties according to their requirements. Of this sum 70 per cent was paid in labor—"worked out." as it is called.

During the year 25 road machines were imported from the United States at a cost of \$5,375; one grader, also from the United States, and some other machinery were likewise pur-

chased, a total of nearly \$10,000 having been expended for new machinery. There are now about 75 road machines and 20 graders in the Province. During the last five or six years road machinery to the value of over \$20,000 has been purchased, much of it from the United States.

It is estimated that there are 72,000 culverts in Nova Scotia, ranging from 6 feet in width down to one foot. Practically all of the culverts constructed up to a short time ago were of wood, costing on an average \$7 each, but some concrete, hard or vitrified brick, and stone culverts have been built in the last few years. Concrete culverts can be put in for an average cost of \$20 or \$25. They last several times longer than a wooden structure and require less attention and repair.

ROAD BRIDGES IN COLORADO

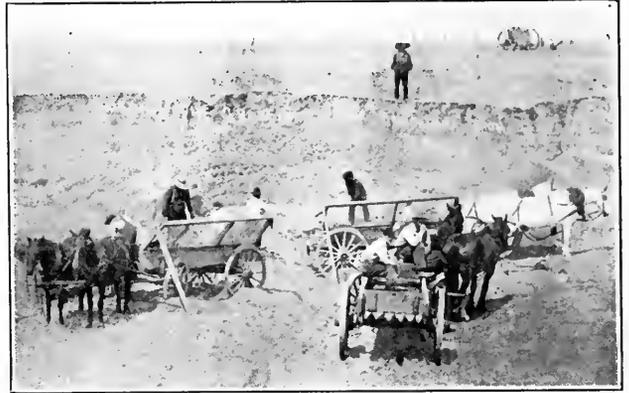

A PECULIAR style of bridge called a "flush" bridge has been built by the Colorado State Highway Commission, which is certainly unusual in that it is laid on the bed of the creek rather than spanning it. This creek is one of those which are more or less numerous in that section of the country, which seldom contain any water (visible upon the surface at least), but are subject to heavy floods. The creek is of a sand which it was impossible to haul a heavy load through, but an ordinary road constructed on it would have been washed away by the first flood. Under these conditions this so called flush bridge was built, being anchored to piles driven into the bed of the creek. These piles were built in sets of three across the roadway, which was 13 feet wide, the sets or bents being spaced 12 feet between centers. The heads of the piles were cut off a little below water level in the bed of the creek and capped with reinforced concrete sills whose top surfaces were brought up about flush with the surface of the sand. These sills support reinforced concrete slabs which are anchored to them by the reinforcement. There are two of these bridges or roadways, each of them about 400 feet long. The entire structure has sufficient strength to carry a 15-ton road roller or traction engine without receiving any support from the sand under the slabs.

At another creek crossing a reinforced concrete slab floor is supported upon reinforced concrete piles; the use of wooden piles being considered objectionable in that "wooden piling would not endure above water level." The longest of the piles are 54 feet in length.

HOME-MADE ROAD APPLIANCES

THE third biennial report of the State Highway Commissioner of Michigan for the years 1909 and 1910 contains descriptions of simple devices which can be cheaply manufactured by road commissioners or others for use in making gravel roads; together with instructions for constructing such roads. One of these is a contrivance for screening gravel at the bank. This consists of a screen so attached to the side of the cart which is to haul the gravel that the gravel is screened and deposited in the cart without any rehandling. This wagon screen is described as follows:

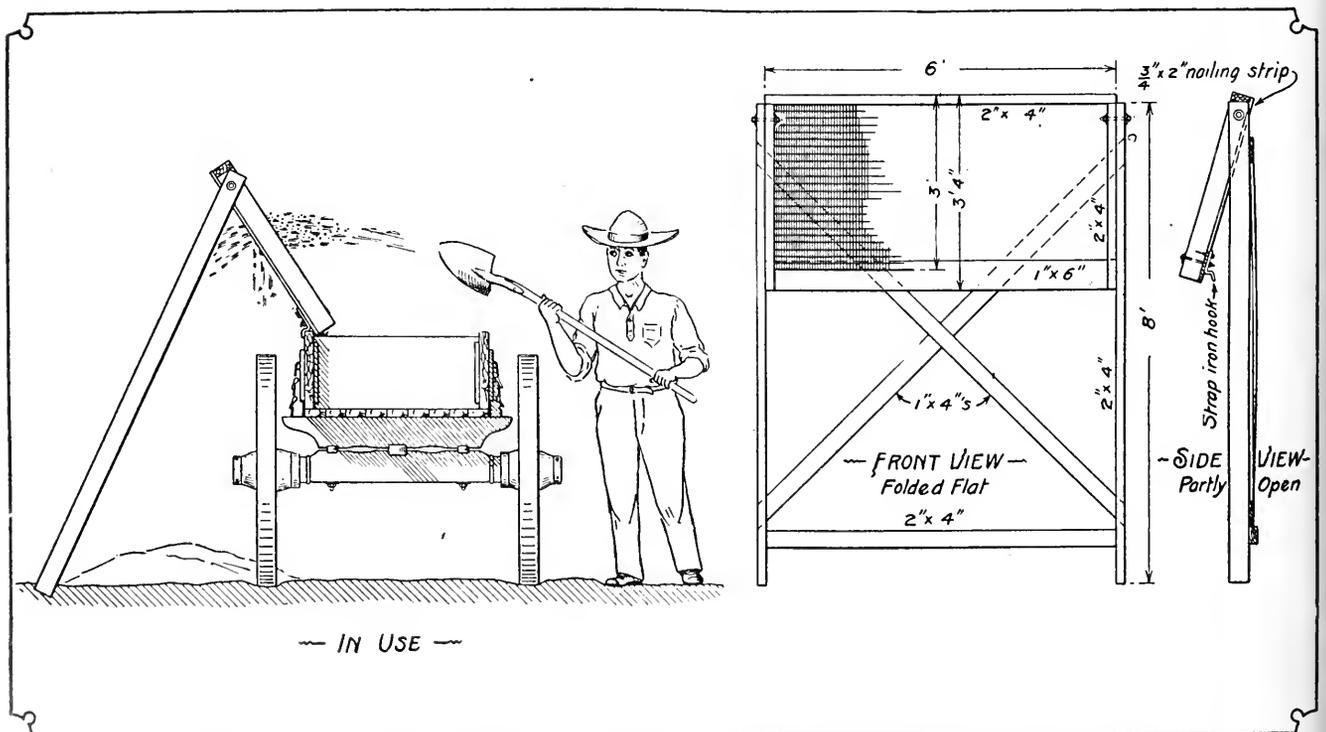

This is a long screen about the length of the wagon box and three feet wide, which is attached to the far side of the box. The gravel is shoveled over the box against the screen, allowing the pebbles to slide back into the wagon while the sand falls through the screen onto the ground on the opposite side.

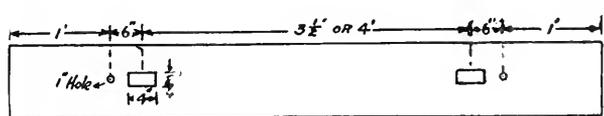

WAGON SCREENING DEVICE IN USE

Hand screening is more expensive [than portable power screening plants], frequently costing as much as 40 cents per cubic yard for the screened product. Wherever the screening of sandy gravel has been tried the quality of the roads has been so much improved that the people are satisfied that the extra cost is a good investment.

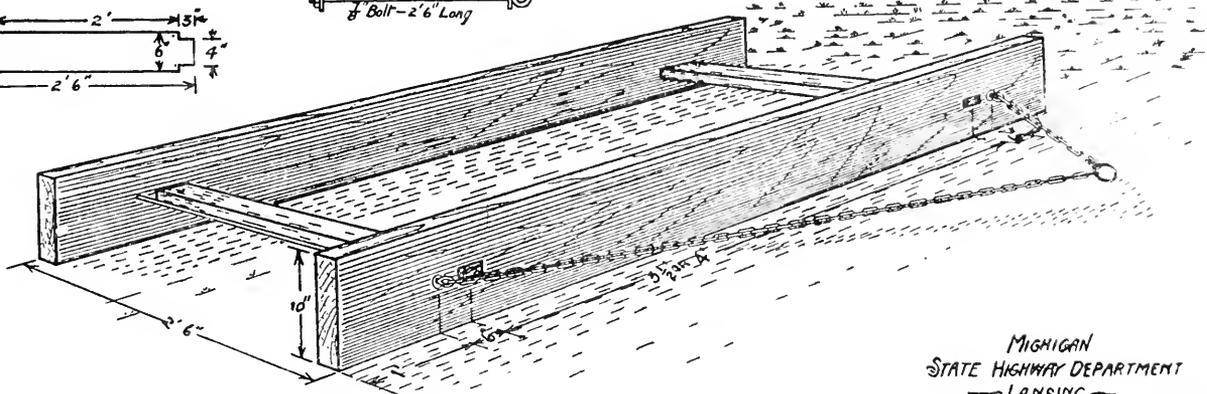

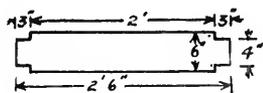

For rolling either gravel or dirt roads the commissioner suggests a method of constructing a five-ton roller at a cost of about \$50. "Purchase a boiler shell 4 ft. 6 in. long and 3 ft. 9 in. in diameter. Set it upon end, put a shaft in the center

WAGON SIDE GRAVEL SCREENING DEVICE, MICHIGAN STATE HIGHWAY DEPARTMENT.

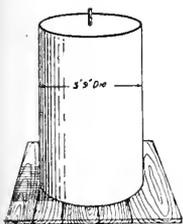

PLANK ROAD FLOAT

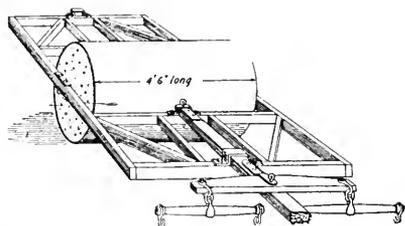

MICHIGAN STATE HIGHWAY DEPARTMENT - LANSING.

DETAILS OF PLANK ROAD FLOAT.

and fill the shell with concrete. Make a frame like the one illustrated and you will have a five-ton road roller at a cost of about \$50."

CONCRETE ROAD ROLLER

is not so well known and is described in this report as follows:

The plank float can be made from an ordinary bridge plank by sawing it in two in the middle. The two planks forming the sides should be at least 2 inches thick, preferably 2 1/2 or 3 inches, from 10 to 12 inches wide and 6 1/2 or 7 feet long, and of hard wood. A platform of inch boards, loosely nailed to the cross pieces allows the driver to ride whenever the float does not move enough earth. He also varies the weight on different parts of the float, as may be required, by shifting his position.

The float is made more lasting by bolting a steel plate 1/4-inch thick and 3 inches wide on the front of each plank. However, if this is not done, the float can be used, both sides forward and both sides up, thus wearing off all four edges of each plank before it has to be thrown away.

The ring or eye in the long bolt should be large enough to readily permit a log chain to slip through. A 3/4-inch or 5/8-inch bolt will usually be large enough. The cost of these floats, lumber and labor, all told, should not exceed \$2.50 or \$3 each.

SPECIFICATIONS FOR MACADAM ROADS

Bituminous Macadam and Bituminous Concrete Paving—Complete Standard Specifications of the Association for Standardizing Paving Specifications—Asphalt and Coal Tar Cements—Mixing and Laying

The specifications given below are those adopted by the Association for Standardizing Paving Specifications at their meeting in January of this year. These cover macadam with a bituminous binder and bituminous concrete, which latter the committee defined as "Any mixture suitable for paving purposes composed of broken stone, sand and bituminous cement, mixed together before being laid, and which is laid while in a plastic condition. If the stone is spread in place and the bituminous cement or binder applied afterward, the resulting product is bituminous macadam." Strictly speaking the so-called specifications for the bituminous concrete pavement are not specifications but rather a description of the method recommended for constructing such a pavement. These recommendations, however, can be used as the basis for formal specifications. On a number of points the committee presents alternative methods depending upon conditions of traffic, materials available, etc.

Concerning the use of bituminous concrete the committee stated in their report: "It is the belief of your committee that bituminous concrete may be successfully used as a paving mate-

rial under a great variety of conditions and traffic; that it is especially adapted to use on a well constructed macadam base, either new or old, plain or bituminous, and finds an especial field in providing a permanent wearing surface on old macadam."

The committee decided to recommend only methods, proportions and materials which had been tried successfully and considered only the bituminous cements which retained their original consistency for mixing and laying, excluding from consideration emulsions, oils volatile in character and cements softened with light fluxes so that they can be worked cold or at low temperatures. The cements specified are practically solid at ordinary atmospheric temperatures and required to be hot while being mixed with the stone and sand.

Concerning the range of penetration for asphaltic cements the committee stated: "A penetration of 40 will give a hard and stable pavement, while 100 will give a pavement too soft for heavily traveled streets. The choice should be made to meet conditions and the specifications applying to any particular case

drawn closer within the limits named for penetration, working temperatures, etc."

The committee which prepared the specifications for macadam pavement consisted of J. L. Darnell, chairman, consulting engineer, Kansas City, Mo.; E. H. Thomes, vice-chairman, assistant engineer Bureau of Highways, Borough of Queens, New York City; W. G. Leininger, assistant superintendent of street, Department of Public Works, Chicago, Ill.; A. C. Schrader, superintendent and engineer, West Park Commissioners, Chicago, Ill.; C. L. Hutchinson, member Board of Public Works, Indianapolis, Ind.; W. T. Brooke, city engineer, Norfolk, Va.

That which prepared the specifications for bituminous concrete pavement was as follows:

Linn White, chairman, engineer South Park Commissioners, Chicago; J. M. Burrows, assistant civil engineer in charge of street construction, Des Moines; Henry M. Milburn, city asphalt chemist, Omaha; G. F. McGonagle, city engineer, Salt Lake City; L. W. Rundlett, commissioner of public works, St. Paul; W. J. Hardec, city engineer, New Orleans; J. C. Ely, director of public service, Dayton; W. H. Connell, assistant commissioner of public works, Borough of Bronx; James A. Hooke, assistant sewer commissioner, St. Louis; M. R. Shererd, chief engineer Department of Public Works, Newark.

"By permission of the association these extracts are reprinted from the copyrighted Proceedings of the Association for Standardizing Paving Specifications. John B. Hittell, secretary-treasurer, 5917 Winthrop avenue, Chicago."

MACADAM PAVEMENT

ROADBED SUB-GRADE

The full width of the roadbed shall be brought to the proper line, grades and cross section indicated on the plans by excavating, filling and thoroughly rolling with an approved road roller weighing at least ten tons; all soft or spongy ground shall be removed and refilled with gravel or other approved material which will pack, and the rolling shall be continued until the roadbed is thoroughly consolidated and shaped to the satisfaction of the engineer. A wooden templet, shaped to the proper size and crown of —inch per foot from center to side, or other equally satisfactory methods shall be used to obtain the required contours of all the courses.

Note.—The crown may be from $\frac{3}{8}$ to $\frac{3}{4}$ inch per foot, to be determined by the engineer for each particular case.

DRAINAGE

(Insert specifications for transverse and longitudinal pipe or stone drains and Telford or large size stone macadam foundation to meet local conditions.)

Upon the properly prepared foundation shall be placed the specified crushed stone macadam laid in two courses.

STONE

(Insert specifications for character and quality of stone to best meet local requirements.)

The product of the stone crusher shall be separated into three grades or sizes by any satisfactory method or by means of a stone screen having circular openings of the following diameters: $\frac{3}{8}$ of an inch, one (1) inch, and three (3) inches. These grades shall be hereinafter designated as screenings, $\frac{3}{8}$ -inch stone and 2-inch stone respectively.

The above specification is designed to utilize all the product of the rock crusher; the 2-inch stone to be used for both the top and bottom courses, the screenings to fill the voids in the lower course and the $\frac{3}{8}$ -inch stone to fill the interstices in the top course and form part of the wearing surface.

This clause is open to suggestions, criticisms and further modifications. At the present time, stone is specified by a minimum and maximum length, by a maximum diameter in passing through the circular openings of a revolving stone screen, by an average of the diameters of the openings of the screens and by arbitrary designation of sizes or numbers; also by variable combinations and percentages of the above, and by proportions between the maximum, minimum and average length. It is recommended that this Committee confer with the committees of this Convention on Concrete and Bituminous Concrete and later take up the matter with committees of similar organizations and with quarrymen and manufacturers of stone crushing and screening machinery, with a view of standardizing the grades and sizes of crushed stone. By such standardization along practicable commercial lines, stone plants can be operated more advantageously, the stock sizes can be prepared and stored in slack times, orders can be filled quicker, competition will be encouraged and the price of stone will be reduced, together with other advantages.

LOWER COURSE

The lower course shall consist of run of crushed stone, which shall pass a three (3) inch and be retained on a one (1) inch screen. The stone shall be laid upon the properly prepared foundation to a depth of four (4) inches when compacted. The depth of the loose stone in all cases shall be fixed by laying upon the sub-grade cubical blocks of wood of the proper size and spreading the stone evenly to conform thereto. This course shall be thoroughly rolled until the stone does not creep or wave ahead of the roller. Stone screenings or sand shall then be uniformly spread over the surface in small quantities by shovels from carts or piles of filler alongside the road and the rolling continued, sweeping in the screenings meanwhile until no more will go in dry, when the surface shall be well sprinkled by an approved sprinkler to fill the voids, screenings being added where necessary and the rolling continued until the surface is satisfactory finished. No filler shall be left on the surface, but the surface shall be left with the clean stone projecting for a bond, leaving the lower voids thoroughly filled.

NOTE.—Upon a poor foundation or where a finished depth of stone of more than 4 inches is deemed advisable, the stone shall be laid in two layers and treated as above described. Good results may be obtained without filling the voids in the lower course, but upon a sandy soil or a well-drained roadbed better results seem to be obtained by thoroughly filling the voids in the stone. Stone screenings, sand, or other suitable material may be used as a filler. Good results may be obtained by a sand filler, and results are also obtained when a small quantity of stone screening dust is used on top of the sand to fill the voids in the sand. The voids may be filled without application of water if all the materials are dry; but a firmer foundation seems to be secured when the course is well puddled with water. In some cases properly screened gravel may be used as a bottom course and as a filler in the top and bottom courses.

TOP OR WEARING SURFACE COURSE

Upon the bottom course shall be evenly spread crusher-run stone which shall pass a three (3) inch ring and be retained upon a one-inch screen, to a finished depth of two and one-half (2½) inches. This course shall be dry rolled with the steam roller hereinbefore mentioned only until the individual fragments have keyed together; the surface, while even and conforming to the required crown, being left open or porous in order to allow the penetration of the hot bituminous binder.

BITUMINOUS BINDER

The bituminous binder shall comply with the following requirements:

NOTE.—Insert specifications for binder best suited to meet the local conditions.

The binder shall be heated in an approved heater equipped with a fixed or portable thermometer which will clearly and accurately indicate the temperature of the binder. The bituminous binder shall be heated to a temperature of not less than 250 degrees Fahr., nor more than 350 degrees Fahr., and shall be uniformly distributed over the macadam by suitable appliances at a rate of not less than one and seven-tenths (1.7) gallons to the square yard. Directly after application, clean trap rock or equally satisfactory stone chips, free from dust and consisting of fragments which will pass a one-inch ring, but be retained upon a three-eighth ($\frac{3}{8}$) inch screen shall be spread over the surface in sufficient quantities to fill the surface voids and prevent the binder from sticking to the wheels of the roller. Care shall be exercised not to apply more stone chips than will just fill the interstices, and any surplus material shall be swept from the surface as directed. The road shall then be rolled until solid, more stone chips or screenings being applied as required in order to maintain satisfactory conditions.

A seal, flush, paint or squeegee coat of the hot binder shall be uniformly distributed over the surface at a rate of at least one-half ($\frac{1}{2}$) gallon to the square yard. Clean stone chips or screenings such as previously described shall then be spread over this seal coat in just sufficient quantity to take up all excess of binder and form a smooth, well-bonded surface when rolled. The road shall be rolled until smooth and firm and to the proper lines and grades.

The stone must be dry and free from dirt or dust at the time of applying the bituminous binder. The application of binder shall not be made when the atmospheric temperature is below 50 degrees Fahr., unless specially permitted by the Engineer.

BITUMINOUS CONCRETE PAVEMENT

NEW MACADAM FOUNDATION

If the pavement is to be laid on a new macadam foundation it shall be built according to the standard specifications for macadam, as follows:

Construct the first course of macadam about 1½ inches less

in thickness than the intended thickness of the completed foundation, thoroughly rolling and bonding the stone by the use of screenings or screenings and coarse sand and water. When this is done spread the second course, consisting of an even layer of about 1½-inch stone without screenings or other fine bonding material, and roll until the particles of stone lie firm and even. If the second course is applied before the first is completely dried out, the layer of 1½-inch stone will be partially imbedded, some of the fine material working up from below and holding it in place. Care should be taken, however, to see that the first course is not soft enough, either from lack of sufficient rolling or excess of water, to completely imbed or fill the second course of stone.

When the bituminous concrete wearing surface is applied to a base thus prepared, it will, under the roller, enter the interstices of the upper layer of stone, completely filling them and bonding the foundation and wearing surface together. This condition is necessary to secure the best results in a bituminous concrete pavement, the base and wearing surface acting together as one homogeneous structure, and not as a pavement made up of foundation and wearing surface acting as two separate layers.

The thickness of the macadam base should vary somewhat, according to the traffic and character of subgrade.

On a well-drained and firm subgrade eight inches of macadam is sufficient for a foundation under any but the very heaviest of city traffic. For streets or roads of medium traffic and good subgrade conditions four to six inches is sufficient.

As an alternate form of construction, when desired, the second course of 1½-inch macadam stone may be poured with a bituminous filler, using not quite enough to fill the voids. Over this there should be spread a light layer of ¾-inch stone, using enough to about half cover the surface, and then giving it a light rolling. This is necessary to put the foundation in a condition to be worked over, as the base thus treated should be disturbed as little as possible.

The bituminous filler used for pouring the base should be of the same character as the bituminous cement in the wearing surface, but in consistency it may be somewhat softer and lighter for the purpose of securing better penetration. Thus when asphaltic cement is used in the surface the base should be poured with a filler or binder of asphaltic origin, and when tar cement is used in the surface a tar should be used for pouring the base. If, however, the asphaltic cement has an original penetration as low as 60 the binder for the base should have 60 or higher. With asphaltic cements higher than 60 penetration the same material may be used as binder for the poured base.

On a foundation thus prepared a somewhat thinner layer of bituminous concrete may be used with safety, though the economy of this construction is somewhat doubtful unless the expected traffic is light, in which case the wearing surface of bituminous concrete may be made quite thin, composed of a fine aggregate, as hereinafter specified, and the pavement be considered finished without a seal coat.

OLD MACADAM FOUNDATION

If the pavement is to be laid on an old macadam, base the surface shall be thoroughly swept and cleaned of all fine material that may be caked upon the surface of the stone or lying loose as dust, thereby exposing the clean, coarse stone for the reception of the bituminous concrete.

If the old macadam does not present the desired coarse, grainy surface, or is not at proper and satisfactory grade after cleaning, it shall be spiked up and redressed to the desired crown and grade, the coarse stone being brought to the top by harrowing or otherwise, or new stone added when in the opinion of the engineer in charge it is needed to give the necessary grainy surface or thickness of foundation. It shall then be thoroughly rolled with the use of as little water as possible, so the surface of the macadam does not flush up smooth.

It is not practicable to pour an old macadam base with a bituminous filler unless a complete new surface of stone is provided, in which case it may be treated as specified for new macadam.

CONCRETE FOUNDATION.

If a hydraulic concrete foundation is desired it should be laid according to the standard specifications for concrete foundation.

CURB

If a curb or curb and gutter is used, the face against which the paving material will be laid shall be painted with a coat of the hot bituminous cement in advance of the pavement.

A curb or curb and gutter should be used in all cases of a street devoted to miscellaneous uses and where there is occasion for many vehicles to stop at the curb line, but in the case of a park driveway or a suburban highway a bituminous concrete pavement may be successfully used without a curb. No other protection for the edge of the pavement is required except to provide a coarse, grainy base into which the paving material is rolled.

WEARING SURFACE

On the foundation, as heretofore specified, shall be laid the bituminous concrete wearing surface, which shall consist of a mineral aggregate mixed with bituminous cement and laid as hereinafter specified.

This wearing surface shall have a thickness of inches after thorough compression with a roller.

For heavy traffic a thickness of two inches is sufficient for all practical purposes, and in some cases will afford greater stability than a greater thickness.

For moderate and light traffic one and one-half inches, or for light traffic one inch will be sufficient thickness for the wearing surface when laid on a well-constructed macadam base, as specified above.

MINERAL AGGREGATE.

The mineral aggregate shall consist of a mixture of broken stone and sand, to which in some cases may be added a small quantity of stone dust or Portland cement.

Any sound, durable stone, either trap rock, limestone or granite, usually considered suitable for macadam, may be used. It should be broken as nearly cubical as practicable. It should not show distinct planes of cleavage or crystalline faces, and should not readily crush or split under the roller when being rolled in the pavement. Between two kinds of stone, choice should generally be made of the one showing the greatest toughness, rather than hardness. A certain percentage of absorption, such as is shown by the better grades of limestones, is a desirable quality, as the bonding strength of the cement is somewhat improved thereby.

The stone shall vary in size from a maximum of about half the thickness of the wearing surface to the smallest particle retained on the finest mesh screen commonly used on crushing plants. That is, the minimum screen should be one-fourth inch for dry stone and one-half inch for wet stone. For a two-inch wearing surface the stone would vary in size from that passing a one and one-fourth-inch screen to as small as that held on a one-fourth-inch screen, and for one-inch wearing surface from that passing a three-fourth-inch screen down to the same minimum.

The dust or fine screenings should be removed from the stone, as it usually is excessive and irregular in quantity and necessitates the use of a greater amount of cement.

The sand shall be similar in character to that commonly used in sheet asphalt mixtures. It shall be hard-grained, moderately sharp, free from loam or other foreign material and varying in size from that passing a ¼-inch screen to dust passing a 200-mesh screen. There shall not be over 5 per cent passing the 200-mesh screen and there should not be over 30 per cent held on the 10-mesh screen.

The dust which may be added to the mixture shall be either a Portland cement or ground limestone. Its purpose is to act as a filler and stiffen or harden up the paving mixture to meet conditions of heavy traffic or to add stability to a tar cement or an asphaltic cement having high ductility and readily affected by change of temperature.

Its use lessens the resiliency of most bituminous concretes, and should be used with discretion. Not over 4 per cent by weight should be added to any bituminous concrete mixture and a screening of the combined aggregate should show not over 6 per cent of 200-mesh material. If an asphaltic cement is used having finely divided mineral matter self-contained this should be taken into consideration in the determination of total dust.

BITUMINOUS CEMENT

The bituminous cement may be either asphaltic cement or refined coal tar.

Asphaltic Cement

The asphaltic cement may be prepared from the following asphalts, combined with flux as hereinafter specified if flux is necessary: (1) From refined natural asphalt; (2) from the residue obtained in the careful distillation, either with or without oxidation, of asphaltic or semi-asphaltic petroleum; (3) from any uniform combination of the preceding materials, together with a suitable flux, if flux be necessary, such combination being subject to the approval of the engineer.

Each bidder must state the nature and origin of the bitumen to be used by him, and, further, shall submit samples of the bitumen with his proposal.

The asphaltic cement shall pass the requirements designated below:

(1) It shall have a penetration of from 40 to 65 at 77 degrees Fahr. for use on streets where there is much heavy traffic and where it is desired to have a hard, exceedingly stable pavement. The penetration shall be from 50 to 100 at 77 degrees Fahr. for use on streets or roadways where the traffic is medium and where a resilient, non-slippery pavement is an important consideration. (The above penetrations are measured in hundredth centimeters with a No. 2 needle weighted with 100 grams acting for 5 sec.)

(2) When 20 grams of the cement are maintained at a temperature of 325 degrees Fahr., for five hours in a tin box 2½

inches in diameter, there must not be volatilization of more than 3 per cent by weight of the bitumen present, nor shall the original penetration be reduced thereby over one-half.

(3) The bitumen of the asphaltic cement shall give upon ignition not more than 15 per cent of fixed carbon for asphaltic cement of penetration between 65 and 100, and not more than 16½ per cent for asphaltic cement between 40 and 65.

The method of test employed is that recommended by the committee on coal analysis of the American Chemical Society.

(4) Of the bitumen of the asphaltic cement which is soluble in carbon disulphide, 0.8½ per cent shall be soluble in carbon tetrachloride. In this test for carbones the asphaltic cement to be tested should be allowed to stand over night covered with purified carbon tetrachloride. The test to be performed in subdued light.

(5) At 32 degrees Fahr. the bitumen of the cement shall have a penetration of not less than 8 when tested one minute with the needle weighted to 200 grams.

(6) The cement shall not flash at a less temperature than 350 degrees Fahr., New York State closed oil tester.

Flux

The fluxing material may be a paraffine, a semi-asphaltic, or an asphaltic residuum which shall be tested with and found suitable to the asphalt to be used.

The residuum must have a penetration greater than 350 degrees with a No. 2 needle at 77 degrees Fahr. under fifty grams weight for one second.

A natural maltha may be used if it passes the heat and flash tests specified under "a."

(a) The paraffine residuum shall have a specific gravity of 0.92 to 0.94 at 77 degrees Fahr. It shall not flash below 350 degrees Fahr. when tested in the New York State closed oil tester, and shall not volatilize more than 5 per cent of material when heated five hours at 325 degrees Fahr. in a tin box 2½ inches in diameter, as officially prescribed.

(b) Semi-asphaltic residuum shall have the same general characteristics as paraffine residuum except that it shall have a specific gravity of 0.94 to 0.98 at 77 degrees Fahr.

(c) Asphaltic residuum shall have the same general characteristics as paraffine residuum except that the specific gravity shall be not less than 0.98 nor more than 1.04 at 77 degrees Fahr.

Coal Tar Cement

The coal tar cement shall be residue of the distillation of coal tar only, and shall be refined for the special purpose of making a paving cement.

No mixture of hard pitch with the lighter oils of coal tar will be permitted.

Its specific gravity shall be not less than 1.20 nor more than 1.20 at 60 degrees Fahr.

It shall contain not less than 20 per cent nor more than 35 per cent of free carbon insoluble in benzol.

It shall be free from water as determined by distillation and shall show upon ignition not more than ½ per cent of inorganic matter.

No distillate shall be obtained lower than 338 degrees Fahr. and up to 600 degrees, not less than 10 per cent and not more than 25 per cent of distillate shall be obtained. The distillate shall be of a gravity of not less than 1.03 at 60 degrees Fahr.

The residue shall have a melting point of about 165 to 170 degrees Fahr. In making this distillation an 8-ounce glass retort shall be used and the thermometer suspended so that before applying the heat the bulb of the thermometer is ½ inch above the surface of the liquid. The melting point of the pitch shall be determined by suspending a ½-inch cube in a beaker 1 inch above the bottom. The temperature shall be raised 9 degrees per minute from 60 degrees Fahr. The temperature recorded the instant the pitch touches the bottom shall be considered the melting point of the pitch.

PROPORTIONS

The proportions of the various ingredients composing the bituminous concrete shall be approximately three parts of stone to two parts of sand, to which shall be added from 7 per cent to 10 per cent by weight of the bitumen. If stone dust or Portland cement is added to the mixture it shall be in such quantities that a screening of the whole aggregate shall not show more than 6 per cent by weight passing a 200-mesh screen.

The dust or Portland cement should be used only in the following cases: (1) When the traffic is heavy and it is desired to harden and stiffen up the paving mixture, in which case the percentage of bitumen should be increased to about 9 to 10 per cent by weight of the whole mixture; and (2) when a bituminous cement of great ductility and short range of temperature is used, in which case the percentage of bituminous cement should not exceed 9 per cent.

In general, the percentage of bituminous cement used should be varied according to the varying characteristics of the mineral aggregate—the more fine material there is in the mixture the greater the percentage of bituminous cement—and the resulting product should be a tough, pliable, well-filled and waterproof mixture.

METHOD OF MIXING

The aggregate shall be dried and heated in properly designed driers before mixing with the bituminous cement. The driers shall be of the revolving type, thoroughly agitating and turning the materials during the process of drying. When the aggregate is thoroughly dried and heated to a temperature of from 200 to 350 degrees Fahr., depending upon the bituminous cement used, it shall be immediately, before cooling or exposing to moisture, mixed with the hot bituminous cement as hereinafter specified. If stone dust is used it shall be introduced directly into the mixer without passing through the drier.

The bituminous cement shall be melted in a tank arranged so the heat can be properly and easily controlled and regulated. When melted and raised to a temperature of from 200 to 350 degrees Fahr., depending on the bituminous cement used, it shall be combined in the proper proportions with the hot aggregate and immediately mixed in a properly designed mixer with revolving blades until a thorough and intimate mixture of the ingredients has been accomplished, and the particles composing the aggregate evenly and thoroughly coated with the bituminous cement. The mixer shall not be exposed directly to the action of fire.

METHOD OF LAYING

While still hot from the mixer the paving mixture shall be spread evenly on the foundation with hot iron rakes and shovels, so that when compressed with the roller it shall have the thickness specified, with the surface even and true to grade. Along the curb and around manholes, catch basins and other obstructions in the street, where the roller cannot reach, the compression shall be secured by the use of hot iron tampers. The rolling and tamping shall be done as quickly as possible after the material is spread, while still hot and pliable. When the paving mixture is hauled on the street in dump wagons it shall be, when ordered by the Engineer, kept covered with canvas to retain heat, dumped on platforms and shoveled into place and raked to the proper grade. As soon as spread the paving mixture shall be rolled with a tandem steam roller weighing at least five tons and the rolling continued, working lengthwise and diagonally of the street. When the pavement is to be subjected to heavy traffic additional compression in the wearing surface should be secured by the use of a 10-ton roller. Rolling must be steadily kept up and continued until all roller marks shall disappear, and the surface gives indications of no further compressibility.

The paving shall be done continuously, so the number of joints between the hot and cold material may be reduced to the minimum. When it is not practicable to lay it continuously and a joint is unavoidable, the edge of the cold material shall be trimmed down to a rough feather edge, and the surface, where the joint is to be made, painted over with bituminous cement, the hot material raked over the feathered edge and thoroughly rolled. Instead of trimming the cold material, joint strips may be used consisting of strips of canvas about 18 inches wide, with three parallel lines of ¾-inch ropes sewed on the under side about 3 inches apart. The joint strips shall be laid on the feather edge of the freshly raked material with the upper rope at the line where the thickness begins to decrease and the rolling completed on top of the canvas as for finished pavement. A square faced may be used when in the opinion of the engineer it is desirable. The faces of the curb and gutter, iron castings, etc., shall be painted with the bituminous cement before the paving mixture is laid.

SURFACE FINISH

As soon as possible after the rolling of the mixture is finished, and while the surface is still fresh and clean, and, if possible, while warm, a seal coat of bituminous cement of proper consistency to be flexible when cold shall be spread over the surface. It shall be applied while at a temperature of from 200 degrees to 350 degrees Fahr., depending on the bituminous cement used, and evenly spread with rubber squeegees. Only a sufficient coat shall be spread to flush the surface voids without leaving an excess. Immediately over this a top dressing of torpedo sand, fine gravel or stone chips free from dust, which must be thoroughly dry and heated in cold weather, shall be spread and thoroughly rolled into the surface. A small surplus shall be left to be worn in or worn away by the traffic.

In the case of park drives and roadways not subjected to heavy, constant traffic, and where a more grainy and coarse surface is desired, the surface finish specified above may be omitted and the following method of finishing adopted:

As the bituminous concrete is raked to grade and just before the roller comes on it, spread dry stone chips evenly with swinging motions of a shovel, until the surface is barely covered one stone chip deep. Then roll thoroughly as specified in the preceding paragraph relating to method of laying. If bare spots appear under the roller, sprinkle more chips and continue the rolling until the whole surface is fairly covered.

After the sand or stone chips have worn into the surface the street shall be swept, all excess of surfacing material removed and the street left clean.

Modern Road Experiments

During the past year the systematic study of the various new methods of building roads and a comparison of these with the better grades of water-bound macadam, have been carried on very generally in all parts of this country as well as in Europe. On January 4th we described experiments which are being conducted by the State of Ohio, and from time to time we have referred to those being carried on by the general government in several parts of the country. This week we give at some length the conclusions which may be drawn from a few months' experience on an experimental road in Greater New York.

Possibly of even more value than special experimental roads is the collection of accurate data concerning roads built in the ordinary run of department work, but concerning the construction of which a careful record was kept, and whose durability and serviceability are noted by frequent inspection. Some of the

features of experimental roads which are apt to be misleading are referred to in the article concerning the Bronx road; these including a tendency to excessive use of bituminous material and unreliability of cost figures. An excellent idea is that of the Road Board of Great Britain, (see page 703) which requests road engineers to keep careful record of construction methods and conditions of surfaces, details of construction, etc., offering to test bituminous materials used in their construction and submit analyses of them to be recorded as a part of the data for each road.

Association for Highway Improvement

An organization known as the "American Association for Highway Improvement" was organized at Washington, D. C., Nov. 22, 1910, and the headquarters of the society are in that city. The purposes of the organization are stated to be:

To correlate and harmonize the efforts of all existing organizations working for road improvement.

To arouse and stimulate sentiment for road improvement.

To strive for wise, equitable and uniform road legislation in every State.

To aid in bringing about efficient road administration in the States and their sub-divisions, involving the introduction of skilled supervision and the elimination of politics from the management of the public roads.

To seek continuous and systematic maintenance of all roads, and classification of all roads according to traffic requirements, payment of road taxes in cash, and adoption of the principle of State aid and State supervision.

To advocate the correlation of all road construction so that the important roads of each county shall connect with those of the adjoining counties and the important roads of each State shall connect with those of adjoining States.

The Association is not designed to supplant any existing meritorious organizations, but it desires to be looked upon as the clearing-house wherein every organization, from the village improvement club to associations national in their scope, may give each of the others the benefit of their experience, their ability and all the facilities at their command.

Road Building in Delaware

Road work in Delaware is under county supervision, but of the three counties most of the work has been done in New Castle county. During the past two years there has been built 37.94 miles of improved roads in this county. About one mile of these was Amiesite; about one-fourth mile was limestone with a top course bound with heavy asphaltum residuum applied by the penetration method, and about 700 feet was the same with Tarvia X substituted for asphaltum. The first named is reported by Commissioner Francis A. Price to have been satisfactory, and the other two to have only one fault—that in places the material comes to the top too freely and makes the surface slippery. Asphaltum oil has been applied to the surface of some roads and allowed to penetrate as it would, and has produced good results in some cases, while in others the road went to pieces under traffic. Calcium chloride applied experimentally to a limestone road was very satisfactory for several months after application.

South Carolina Roads

There are about 46,000 miles of public highways in South Carolina, of which nearly 150 are surfaced with stone, about 3,100 with gravel and about 4,000 with sand-clay. In addition there are a few miles of shell roads. During 1909 and 1910 most of the work was done by convict labor under the direct control of county supervisors. The state makes no direct appropriation whatever for highways.

Sand-clay roads 30 feet wide can be constructed at a maximum cost of about \$450 per mile, and are maintained by a floating gang of five convicts going over the roads once a month, making the monthly cost of up-keep per mile about \$10.00.

DATA CONCERNING STATE AID

The above table has been compiled from the latest data obtained directly from the road officials of the several States. In many of the States the appropriations for 1911 have not yet been made, although such delay is adverse to effective and economical work by a highway department. Of the 49 States and Territories, 13 neither give aid to or exercise control over any roads; two aid only by giving services of convicts, and one by giving convict broken-stone; 5 give nothing but engineering services or advice. The other 28 give more or less direct aid; New York State gives almost as much as all the others combined. In 1910 State aid and State construction totaled about \$17,000,000, the mileage being 4,278. The work so aided varied from mere grading to bituminous macadam and brick pavements.

PARK ROADS

Construction and Maintenance of Park Roads by Metropolitan Park Commission of Massachusetts—Detail Costs

The work of road construction and maintenance by the Metropolitan Park Commission, which has charge of the State park system in the vicinity of Boston, Mass., is of special interest because the commission was one of the first municipal bodies to adopt treatment of roads with tar and asphalt. In respect to the mileage of roads under its charge the work compares in extent with that of an ordinary city. The problem differs, however, from that of a city in that the work is spread over a wide area. Altogether the commission has 80 miles of formal roadways open to automobiles and other classes of pleasure travel. In addition, there are within the woods reservations almost as many more miles of roadways which are restricted to use by horse-drawn vehicles.

In his annual report for 1910 Chairman William B. de las Casas says that for mere reasons of economy it is necessary to keep the roads in as nearly perfect condition as possible. The increased use of automobiles has so changed the character of

the wear and tear upon road surfaces that those rebuilt a few years ago have required entire resurfacing. On account of a public demand the commission withdrew, from November 15 to March 31, its prohibition of the use of roadways by automobiles with chains, and in consequence has made an increased allowance of \$14,000 for road repairs.

Chief Engineer John R. Rablin, in his report states that the work of reconstruction, repairs and maintenance of roadways has been carried on upon the same general lines as hitherto by the use of refined tars, residual asphalts and asphaltic oils. The results, he says, have been generally satisfactory.

Some of the items in the accompanying table, taken from the annual report, require a little explanation. Calcium chloride was used for the most part on roads that were shaded by trees. Item No. 30, cost \$0.931, is a section of Revere Beach Parkway where the subgrade was very spongy. It was excavated, underdrained and reconstructed with 12 inches of gravel screenings under the macadam surfacing.

Item 22, cost \$0.287, is a portion of Middlesex Falls Parkway. The old macadam was scarified, covered with 2 inches of gravel and treated with asphaltic oil, 3/4 gallon to the yard, the work being done by direct employment of labor.

Item No. 2, Blue Hills Parkway, cost \$0.511, an old macadam roadway; it was scarified and new stone added to crown and shape the surface. Tar was applied by a gravity distributor attached to the rear of a tank wagon; temperature of tar 175° F.; work done by the commission by day labor.

CONCRETE ROADS IN MICHIGAN

Concrete macadam roads have been built in Wayne and Saginaw counties in an attempt to secure roadways which will not ravel under automobile travel nor rut under heavy trucking. The former county has been building these for two years and now has nearly eight miles of two-course concrete

macadam roadways. The bottom course or layer is made of limestone concrete mixed one Portland cement, two sand and five broken limestone; the top layer being one Portland cement, two sand and three of crushed cobbles. The combined depth of the two courses is 6½ inches when compacted. The roads are made 15 to 19 feet wide. Saginaw county is constructing several miles of similar roads in which the bottom layer of concrete is mixed 1:2:5, and the top layer 1:2:4, with limestone used in both layers.

Wayne county has built more than five miles of gravel concrete roads laid in one course, the concrete being mixed one cement, two sand and four of gravel.

Included in labor. †Includes hauling away dead material and rolling subgrade, and laying 712 feet of 6-inch underdrain. ‡Includes excavation and filling for subgrade.

NEWS OF THE MUNICIPALITIES

Current Subjects of General Interest, Under Consideration by City Councils and Department Heads—Streets, Water Works, Lighting and Sanitary Matters—Fire and Police Items—Government and Finance

ROADS AND PAVEMENTS

Will Oil Roads Next Month

Pittsburg, Pa.—The dry and summer-like weather of the past few days has made the macadamized county roads unpleasantly dusty, and as the roads are used by many autoists, homes fronting on these highways are coated inside and out with pulverized limestone. The nuisance was unusually pronounced on Washington and Shannon roads in the Mount Lebanon district, where these roads are lined with fine homes. County Engineer S. D. Foster says that in a few days a carload of calcium chloride will be delivered at Castle Shannon, to be used in front of homes along the county roads in the Mount Lebanon district. Mr. Foster says that will overcome the dust until next month, when a general road-oiling campaign is to be inaugurated. The oiling cannot be started earlier because to make it successful warm days and nights are needed to keep the oil from lumping.

Street Oiling to Stop Dust

Waterbury, Conn.—The first oiling of the streets of Waterbury for the present year will probably be done next week when those in the high service will be treated by the Street Department. The lack of rain has placed many city streets in bad condition, dust an inch thick prevailing on some streets, and a high wind causes much discomfort.

Oiling of City Streets Begun

Providence, R. I.—The work of oiling the macadam streets upon which the street cars operate has been started by the Daniels Road Oiling Company, of East Providence, which secured the contract for the work at a recent session of the Board of Contract and Supply.

Property Owner Objects to Narrowing Street

Atlantic City, N. J.—City Council's recent action in reducing the width of Maine avenue has been taken into court under certiorari proceedings brought by Watson R. Lewis, owner of a large-sized property in the square where the avenue has been vacated or narrowed. Mr. Lewis wants to have the ordinance, which cuts off 40 feet from the east side of Maine avenue between Madison and Melrose avenues, set aside on several grounds, one of which is that real estate owned by him on the west side of the particular square involved will be depreciated in value by making the avenue narrower. Mr. Lewis contends that one of the chief features of the attractiveness of his property was the 100-foot wide avenue in front of it and that there was no necessity for reducing the width.

Street Must Be Raised to Make Sewer Possible

McKeesport, Pa.—In planning for sewers for the East End district, especially between Riverton and Lincoln Way, City Engineer Smith finds that the city is up against a proposition, and to overcome it the city will sooner or later be compelled to expend between \$300,000 and \$400,000. Fifth avenue, between the points mentioned, is so low that the usual high waters of the Monongahela River flood it. To overcome this is the problem that now confronts the city. Engineer Smith, reporting to the Street Committee of Councils, says it will be a useless expenditure of money to put down a main sewer in Fifth avenue between these two points, and to repave the thoroughfare as is contemplated. He says the sewer can be put down, but that it will be flooded, and of little use, every time there is a high river. He believes the city should arrange to overcome this. In order to give the committee and Councils something to work on the engineer has prepared a plan, showing Fifth avenue, between Riverton and No. 2 fire station, elevated above the flood stage. At some points the street is shown 13 feet above the present grade, but the engineer says this is necessary. He predicts that sooner or later the city will be compelled to make this improvement.

Oil Sprinkling Given Test

Texarkana, Ark.—The combination oil and water sprinkler recently purchased by philanthropic citizens and business men of the East Side has been used for several days and is giving entire satisfaction. A tank car of heavy oil, purchased by the same men, has been spread over portions of the different streets, furnishing Texarkanians with ample evidence that oiling the streets is one sure way of abolishing the dust nuisance and at the same time improving the road.

Paving Pointers for Fort Smith

Fort Smith, Ark.—Mayor Bourland, City Engineer Reed and Aldermen Howell and Blocker have returned from a trip to Little Rock, Memphis, Shreveport and Dallas to inspect the paving, gather data on the cost and durability of the various kinds of paving and also get data upon municipal government. In describing the different pavements inspected, Mayor Bourland said: "In three of the four cities they are using creosote block to the exclusion of all other kinds of paving material. We were taken over Dallas by the Commissioner of Lights and Water, and find they are giving more attention to their highways in the suburbs than any of the cities we visited. They are tearing up asphalt to put down creosote blocks. Shreveport and Dallas are both using creosote blocks. We saw some that had been down many years, and they were in better shape than the new. The unevenness of the surface of new paving had worn away and the paving was as smooth as the floor of my office. Little Rock is using an asphalt combination they call cement-asphalt, that makes a pretty street, and they say it is very durable. We had a block of it shipped here. I like it equally as well as the creosote block, and it has the additional feature of costing only about one-half as much as the blocks."

Demand for Paving Embarrasses City

Indianapolis, Ind.—"Never before has the demand for street improvements been what it is this year," says City Civil Engineer Henry W. Klausmann. "There may be necessary a special levy, provided for by the new street intersection law, to pay for intersections before the year ends. If not, many of the petitioned improvements cannot be made, because the city treasury will not withstand the cost of all the intersections involved. Several years ago the city government practically had to force street improvements upon the people affected, but now the value of the improvements is realized and they are being demanded faster than the city can supply them." For several months petitions have been pouring into the office of the Board of Public Works for improvements of various kinds in all parts of the city, and it has been found difficult to obtain sufficient money to pay for the street intersections, \$25,000 appropriated a few weeks ago already being exhausted, and another \$25,000 will be necessary. Mr. Klausmann deplored the passage of the law requiring that street intersections be paid out of the general fund of the city, insofar as it applies to Indianapolis. "For fourteen or fifteen years property owners within half a block of each street intersection have had the cost of that intersection assessed among them," he said, "and now through the new law they are being required to help pay for street intersections throughout the entire city. It is not equitable. Had the city always paid the cost of intersections it would be a different matter; but now property owners who already have paid for all street intersections affecting their property directly must contribute to the cost of street intersections in all parts of the city. Of course the city will not always be so greatly hampered in making street improvements because of lack of funds for street intersections as it is this year, for hereafter a special levy can be made to provide sufficient funds for this expense. But this year the law caught the city without any provision for this additional expense and with considerable more than \$100,000 to be spent for street intersections."

New York's Street Commissioner Speaks in Minneapolis

Minneapolis, Minn.—That the condition of a city's streets were of its own making—clean or dirty according to the co-operation of its citizens, and that no cleaning system in the world was efficient unless the people themselves made it possible, was declared by William Edwards, Street Commissioner of New York City, at a luncheon of Publicity Club members at Hotel Radisson.

There was no trace of the "Billy" Edwards, football hero of the nineties, in the serious and dignified consideration of an important municipal subject in his address.

It was a city official speaking whereof he knew, from an experience of ten years in the active service of giving clean streets to the 4,500,000 people of New York.

"Clean streets are like clean houses," said Mr. Edwards; "they depend upon the people themselves. If people are public-spirited enough not to throw rubbish about, the acquiring of clean thoroughfares is not difficult, but it does necessitate a system.

"To my mind the best system in the world is the flushing system, such as I am told prevails here and which is impossible in New York.

"In the early morning hours street litter should be swept into the gutters. Hand labor is necessary, of course, to arrange the litter into piles for carting away. This hand labor should continue through the day in the busier sections. Of course the rotary or revolving broom is of little use, unless the streets are wet before it is used. The Board of Estimate in New York is at present considering the installation of a vacuum cleaner or pickup, such as is now used in some cities of Germany.

"Litter pails or deposit boxes in every block are necessary if one would have a clean residence district. People would soon learn to use these and refrain from throwing things on the streets, and pride in the neighborhood would result."

City Makes Fine Showing in Paving

Galveston, Tex.—Nothing adds to the general appearance of a city more than clean, well-lighted and paved streets, good drainage, well-kept and uniform sidewalks.

The improved condition of the streets in Galveston during the past few years is remarked on by almost every visitor. The home people, who witness the changes as gradually made, fail, as a rule, to observe anything out of the ordinary.

The City Engineer's Department has just completed a statement showing the expenditures by the city for public improvements from Jan. 1, 1903, to Feb. 28, 1911, as follows:

Jan. 1, 1903, to Feb. 29, 1904.....\$115,277.53
Year ending Feb. 28, 1905..... 88,088.77
Year ending Feb. 28, 1906..... 123,892.52
Year ending Feb. 29, 1908..... 156,170.56
Year ending Feb. 28, 1909..... 222,441.08
Year ending Feb. 28, 1910..... 333,553.48
Year ending Feb. 28, 1911..... 331,357.17

Total\$1,491,961.40

Of this sum \$251,970.65 was expended for vitrified brick pavement and \$297,243.51 for mudshell and crushed rock roadways.

Over 6¼ miles of brick paving was laid and 40 miles of mudshell streets. For concrete and vitrified drains \$228,897.58 was expended. Grade raising and filling in addition to Goedhart & Bates contract called for \$300,122.61. Creosoted wooden box drains in the west end cost \$25,699.02. Of the above \$563,433.37 was paid out of the current revenues.

Commissioner Makes Tour Inspecting Roads

Syracuse, N. Y.—"There has been a marvelous improvement in the highways of the State since a year ago, and they were never in nearly as good condition as they are today," declared Deputy Commissioner Frank D. Lyon, of the State Department of Highways, last week. Mr. Lyon is traveling through the State by automobile making an inspection of road work, giving inspection to highways that are being cared for by the towns. He has been from Buffalo through the southern tier of counties, from Albany to Binghamton and from Binghamton to Syracuse, by way of Ithaca and Cortland. About 1,000 miles were covered.

SEWERAGE AND SANITATION

Drinking Fountains for School

Bay City, Tex.—The Civic Club recently made formal presentation to the high school of the sanitary drinking fountains, which have been installed for some time. These fountains are handsome fixtures.

Will Enforce Sanitary Provisions Regarding Cold Storage

Indianapolis, Ind.—Pure milk, pure cream, pure butter, pure cheese and pure cold storage products will be insured to the people of Indiana hereafter if the stringent rules adopted by the State Board of Health at a recent meeting at the State House are enforced to the letter, as the Board contemplates they shall be. The Board adopted three rules which bear on the enforcement of the cold storage law passed by the last Legislature. One of the most important acts of the Board was the defining of a cold storage or refrigerating warehouse, to which the terms of the new cold storage law shall apply. By the ruling of the Board the law will apply to all hotels, restaurants and other places of business employing refrigerating machinery or ice for the purpose of preserving food. In regard to all food kept in cold storage and the length of time it may be kept, it was decided that all such food shall be marked; all marking and stamping or tagging shall be plainly legible and shall show the day, month and year of the date of entrance and removal, in letters and figures not less than three-eighths of an inch in height and of a style known as 36-point Gothic No. 8. The letters or figures shall be in black or purple ink, and if the goods are tagged the tag shall be securely fastened on the package by tacks, nails, strings or glue in such fashion that it cannot be detached. All goods on hand at the end of nine months shall be reported to the State Board of Health and inspected and passed as suitable for food in accordance with the provisions of the pure food law before being withdrawn. Such inspection shall be made by the inspectors of the State Board of Health or by other persons designated by the State Food and Drug Commissioner to make such inspection.

Will Inspect a Sewage Plant

McKeesport, Pa.—Arrangements are being made by President Lysle, of Common Council, to take a party of city officials and Councilmen to Washington, Pa., to inspect the sewage disposal plant at that place. This is to be done so that the city fathers will be able to get some idea as to what will be necessary here when the city builds disposal plants, which will be within the next few years. City Engineer Smith has had designed a disposal plant, the work having been done by Leo Hutson, who is drafting plans of the city's sewage system, and the Councilmen will see how these compare with the Washington plant. The trip planned by Mr. Lysle will be made in automobiles and at no expense to the city.

Sanitary Expert Is Probing Rochester

Rochester, N. Y.—Caroline Bartlett Crane, of Kalamazoo, Mich., a sanitary expert, is visiting the city. The primary object of Mrs. Crane's visit is to make what she terms a "sanitary survey of the city." She will also study various phases of life and habits in Rochester.

When interviewed Mrs. Crane said she was not sure she would find anything to criticize there, adding: "Rochester has the reputation of being a very fine city, well conducted and well groomed. If everything is like the little I have seen, there will not be much to comment upon adversely."

Mrs. Crane will remain about 10 days and an informal report of her findings here will be made at a mass meeting to be held in Convention Hall next week. Later she intends making a written report, in which the minutest details will be covered, to the Women's Educational and Industrial Union, upon whose invitation she is in the city.

A Correction

Oil City, Pa.—We desire to apologize to Oil City, Pa., for a statement which appeared in our issue of May 3. The State referred to was Louisiana, but the "La." was changed to "Pa." by the printer, and the mistake escaped our attention.

WATER SUPPLY

Prepares Chart of the Water Supply

Dayton, O.—Consummating a great deal of tedious technical research and figuring, Charles K. Kline, of the City Engineer's Department, has turned over to Service Director Ely a chart of Dayton's water pressures at all of the local elevation points. The chart, or scale, is based upon the unit of 60 pounds pressure at the altitude at which this pressure was found to be nothing at all. This is an elevation of 159 feet. According to these figures, which have been worked out with scientific accuracy, it is found that numerous parts of the city are inaccessible to water service without auxiliary boosters. This situation will be entirely remedied when the new reservoir is placed in operation. Engineer Kline's chart can then be used by simply taking cognizance of the additional pressure which the new supply will afford. The chart was prepared at Director Ely's request to assist builders in making their calculations for water service.

Municipal Water Works Makes Good Showing

Montgomery, Ala.—The Water Works Department, of which Commissioner E. B. Joseph is at the head, announces a collection of nearly \$18,000 for the month of April from consumers, which is the biggest showing ever made by the department in a single month since the municipal plant was erected. Commissioner Joseph also announces a cut in expenses of the monthly payroll of this department. The office of superintendent was abolished a short time ago, but the Commission retained his services for a short time until the new order of things is straightened out. When the Superintendent retires from service this will mean a reduction of another \$200 a month for the department, bringing the grand total up to \$625 per month.

Pure Water by First of June

Montpelier, Ind.—People of this city are delighted that the drilling on the first well put down by the light and water company is coming on so rapidly. The first well is completed. The second one has been begun and the work on both it and the third will be rushed, and it is hoped that by the first of June the pure water can be turned into the mains, and Montpelier for the first time in years have pure water for domestic purposes.

Site Selected for Big Reservoir

Fort Worth, Tex.—The city's big surface reservoir with a capacity of 10,000,000 gallons, will be located on the west fork of the Trinity, one mile above Morgan's bridge and about six miles west of the heart of the city. This recommendation of J. D. Trammell and Dr. T. U. Taylor, of the board of expert engineers appointed to investigate and select a site, was unanimously adopted by the City Commission. The city will at once begin condemnation proceedings to obtain possession of about 3,000 acres of land for the basin itself and the drainage area.

Will Employ Expert for Water Improvements

South Bend, Ind.—Clinton S. Burns, of Burns & McDonald, consulting engineers, of Kansas City, Mo., is expected to return to South Bend soon with a report on water works conditions in the city.

Although all but minor improvements have been held up awaiting a report from the Kansas City man, there is little doubt but that another water works plant will be added to the equipment of the department in the near future. A plot of ground in Portage Park, the property of the city, has been mentioned as a probable site for the new station. Plans for preliminary improvements to north and central pumping stations have already been put into effect in an effort to give the city a sufficient supply of water during the approaching dry season.

Probably the most important improvement expected to result from Mr. Burns' investigations is the building of a thoroughly modern pumping station. The long contemplated improvement was discussed several months ago by the Board of Public Works, but plans were halted when it was decided to allow the Kansas City man to investigate the needs of the system before further action was taken.

Money Received for Filtration Plant Construction

Minneapolis, Minn.—Drafts for \$504,015, the proceeds of the sale of water works bonds, have been received by C. A. Bloomquist, City Treasurer. The total represents \$500,000, the par value of the bonds, a premium of \$15, and \$4,000 interest accrued from February 1 to April 13. The buyers were allowed \$2,500 to defray the costs of issuing the bonds. The receipt of the money has eased the situation in financing the filtration plant construction and permits of immediate progress in the big construction undertaking.

Big Increase Shown in Water Plant Earning

Knoxville, Tenn.—The books of the Knoxville Water Works Commission show that the net earnings of the plant have increased and the expenses of operating the plant have been reduced. The earnings and expenses for the first four months of 1910 and that of 1911 were compared by William Marfield, treasurer of the commission, so the taxpayers of the city could know whether the plant is a paying proposition to the city. The net income for the first four months of 1911 shows an increase over that of 1910 of nearly \$5,000, and the decrease in expenditures during the same period of 1911 and same under 1910 period is \$2,866.98.

Given Five Years to Remove Pipes

Columbia, S. C.—The city of Columbia will be given five years to remove the pipes across the Columbia canal, as a result of a resolution passed by the last General Assembly and consented to by Attorney General Lyon. The Attorney General brought action against the city of Columbia to require that the pipes which convey the city water be removed from across the canal. He secured an order in the Supreme Court. Upon petition, the time for removing the pipes was placed at seven months. Appearing before the court, Attorney General Lyon stated that he had consented to the order as provided for by the concurrent resolution. He called the attention of the court to the fact that obstructions across the streams of the State were forbidden by the constitution.

Special Rate in Water

Hutchinson, Kan.—It has been announced at the office of the water company that special reduced rates will be allowed patrons for four months beginning June 1 for sprinkling purposes. It has been the custom of the company to allow special rates during the hottest summer months for the benefit of patrons who want to do a great deal of sprinkling on their lawns. However, heretofore the rate has been regulated so that only the users of a great deal of water are benefited by it, while the majority of the patrons are comparatively small users. It is probable that the company will submit for the approval of the commission a rate that will give a benefit of the reduced rate to the small water user.

To Read Meters Monthly

Denison, Texas.—With a view of eliminating numerous complaints from water consumers and promoting co-operation between the Water Department and the consumers in the city, Superintendent Berry, of the Water Department, is making arrangements to have his men read every water meter in the city every month beginning this month. Heretofore meters have been read quarterly and water bills have been paid quarterly. The bills will continue the same as in the past, but the readings will be made every 30 days. Superintendent Berry has also devised a plan whereby each consumer will know the exact amount of water consumed each month. After the meter reader finishes his work he will fill out a card for the consumer containing a regular form. This card will show exactly how much water has passed through the meter during the month just closed and also the amount consumed during the month previous. At the third reading, or end of the quarter, different colored cards from the two previous months will be given the consumer and the key on the card will allow him to figure just how much his quarterly bill will amount to. It is the belief of Superintendent Berry that this system will in time lessen the number of complaints of overcharge that are made each month to the Council.

LIGHTING AND POWER

Gas Rates Lowered by Ordinance

Jackson, Tenn.—Right to charge consumers a maximum of \$1.50 per 1,000 cubic feet for gas for illuminating and fuel purposes, provided a 10 per cent cash discount is allowed the consumer on cash payment of bills at the gas company office on or before the 10th of the month, was granted the Citizens' Gas Light Company by the City Council at its regular monthly meeting. The privilege was conferred by a unanimous passage of an ordinance containing the required provisions. The cost of illuminating gas to the consumer is reduced by the new ordinance from a maximum charge of \$2 per 1,000 cubic feet to \$1.50. The maximum cost of fuel gas is increased 15 cents per 1,000 feet, but this increase is counteracted by the 10 per cent cash discount clause. The object of the gas company in inaugurating the new policy is to discontinue the two-meter system. A decrease in the cost of operating the plant is realized, and the consumer is thus made to share in the economy plan.

Ornamental Lights for City Park

New Britain, Conn.—The Housatonic Power Company has men at work drawing cables through the underground pipes in Walnut Hill Park to connect up the new lights on the ornamental iron poles which have been placed about the park. The poles are the same design which is used in Bushnell Park at Hartford, and they will work in well with the Park Commissioners' plan to beautify and improve the park each year. Eight of the iron poles have been erected at various locations on the park lawn. Seventy-five watt incandescent lights will be suspended from the poles. The current for the lights will be supplied from the high potential street lighting circuit, which is supplied to New Britain and adjacent towns.

Engineer to Estimate Cost of City Electric Plant

Shreveport, La.—The City Council last week, through recommendation of Commissioner John McCullough, of the Department of Public Utilities, selected Anderson Offutt, electrical engineer, of New Orleans, to make a thorough investigation and estimate the cost of establishing a municipally owned light plant here. He is expected to begin work immediately. The filing of his report will likely result in an election on the question of issuing bonds to build the city a plant as suggested by the citizens' committee, which demanded the employment of an expert to prepare an estimate of the cost.

FIRE AND POLICE

Councils Equip City Auto School for Firemen and Police

Wilkes-Barre, Pa.—Members of the Police and Fire Committees of Councils are to open an automobile school. This decision was arrived at last week when the members of the latter committee agreed to defray half of the expenses incident to purchasing a second-hand auto to be used for instruction purposes in the Police and Fire Departments. In addition to this, the Fire Committee reported favorably the measure recently introduced in Councils by A. C. Laning, requiring that in the future all buildings within the fire limits of the city be erected of either brick, stone or concrete.

Work on Pressure Mains Will Start at Once

Toledo, O.—Service Director Cowell and the Waters & Tansey Company have signed the contract for the high pressure service for fire mains. Piping has been ordered by the contractors and work on the power plant will be started as soon as it arrives.

Fire Department Makes Good Showing

Butte, Mont.—Many interesting and important figures about the Butte Fire Department are contained in the report of Fire Chief Peter Sanger, which was made public last week. The loss by fire during the past year was \$35,816, while the amount of property involved was \$2,226,460. The cost of maintaining the department during the year was \$71,500, just \$35.93 more than the appropriation made by the Council.

New Auto Engine Will Be Put Through Trial Tests

Macon, Ga.—The new automobile fire engine has arrived in the city. The car containing the apparatus was placed as soon as possible and unloaded. It is a very fine machine, something like the one now used by the department, with additional improvements. The new engine will be kept at headquarters and the old one sent to the new fire station in Vineville.

Life Saving Squad New Advance Step

Springfield, Mass.—A squad of fire fighters to be known as the life saving crew, which will be sent to fires in the fastest piece of apparatus in the department, was decided upon by the Fire Commission last week. A new car, equipped with three scaling ladders and a life net, will be obtained by an exchange of apparatus and a money consideration from the Knox Automobile Company. The machine will be a "Model M" 50-horsepower, with dual pneumatic tires, in appearance much like the Squad B car, and will be able to carry a squad of 12 men. These men, Chief Daggett said, would be picked especially for the work for which the new machine is designed. It will be stationed at the Chestnut street house, and, with its speed in excess of any other in the department, will be expected to reach fires in its territory in advance of any other apparatus. Its speed will make it possible for the squad to be on hand ready for life saving work if that is found necessary, and also, the men will be expected to do the regular firemen's work if the saving of lives is not required. The Commission considers the move in keeping with its policy to be not only up to date in its fire fighting methods, but ahead of the times as well. The new piece of apparatus will be the only thing of its kind in existence, and is expected to more than prove its value once it goes into commission.

Police Will Help City Beautifiers

Houston, Tex.—Chief of Police Duff Voss has announced the inauguration of a police campaign to enforce the city's ordinances requiring proper disposition of trash and garbage, the maintenance of clean walks and premises, and the ordinance governing the placing of signs in and over the public streets. The order was passed around among the officers at police headquarters and the police have been notified to warn all violators of the law and to arrest where citizens persist in violations. It is the intention of the department to force the cleaning up of the streets and alleys, and to help officially in the "beautifying" campaign inaugurated by public-spirited citizens.

Prevention of Fire Booklet

Rochester, N. Y.—The first edition of 3,000 copies of the booklet on the Prevention of Fire, gotten up by Assistant Secretary Ralph Barstow, of the Chamber of Commerce, has been received at the chamber. The booklets are for free distribution, and will be sent to members of the chamber, the public schools, churches, retail stores, manufacturing and wholesalers.

Mine Rescue Men to Drill Firemen

Birmingham, Ala.—With the official announcement that the firemen of Birmingham would be drilled free by the Bureau of Mines Rescue Corps in their smoke rooms is indicated an entirely new benefit that will probably be derived from the location of that institution in this city. A. R. Brown, foreman of the rescue station, announced that he would make an offer to Chief Bennett soon, and that he hoped the firemen would be permitted to take advantage of it. "We drill classes in smoke-filled rooms about once every week," said Mr. Brown. "If the firemen care to, we will drill them free in the work of entering smoke-charged rooms equipped with Government rescue helmets. This service would be beneficial for the reason that at almost any time the firemen may be called upon to enter buildings so filled with smoke as to suffocate them if they are unprotected. If, on the other hand, they are equipped with smoke-proof helmets with air sufficient to last two hours, they can fight fire without danger, and at the same time rescue any persons who may be unconscious from smoke and bring them to fresh air and safety." Mr. Brown said that absolutely no expense would be attached to the drilling, as the Government was interested in drilling firemen the same as miners.

GOVERNMENT AND FINANCE

Progress in Work for Equal Suffrage

Pasadena, Cal.—To some citizens by far the most important results of last week's election was the test vote, or rather expression of opinion on the suffrage question—extending the franchise to include women. It was the first and only opportunity afforded voters of the State to indicate probable action in the pending constitutional amendment known as Senate Bill No. 8, introduced by Senator Charles W. Bell and pushed vigorously and persistently by Assemblyman H. G. Cattell. To say the advocates of equal suffrage are pleased with the result would hardly express the situation; they are more than gratified and surprised that nearly 1,000 voters of this city under trying circumstances freely and enthusiastically signed a pledge to work and vote for success October 10.

Mayor Will Investigate Charter Conditions

Schenectady, N. Y.—Mayor Duryee has concluded that the city charter question needs very thorough investigation, and he has decided to appoint a commission of citizens to investigate the question and to report its conclusions and recommendations to him. Mayor Duryee will appoint a committee of possibly 10 citizens to make a thorough investigation, so that intelligent action can be taken at the proper time. While this committee will be unofficial in character, its recommendations will undoubtedly attract attention both here and in other cities throughout the State. All forms of charters, including the commission plan, will be discussed at the coming conference of Mayors to be held at Poughkeepsie May 25, 26 and 27, and Mayor Duryee is of the opinion that much valuable information will be the result.

STREET CLEANING AND REFUSE DISPOSAL

Would Sprinkle Streets with Disinfectants

Atlanta, Ga.—That disinfectants be used in the big street sprinklers, which both clean the streets and flush the gutters, was the suggestion made at a recent meeting of the Second Ward Civic Improvement Club. They all thought so well of the idea that the resolution will be sent to Council with an urgent request that it be carried out.

Cistern Water for Streets

Beverly, Mass.—The Beverly Street Department, in order to conserve the water supply in Wenham Lake, which furnishes Beverly and Salem with water, pumped water from the old fire cisterns last week to water the streets. An engine from the central fire station was put in commission, and after all the water from the cistern at the Town Hall had been drawn into the watering carts the water in the cistern near the depot was used. As soon as possible a power plant will be installed at Bass River to furnish the water for the Street Department.

Gets Complaints About Street Sprinkling

Syracuse, N. Y.—Complaints have already been made as to the manner in which sprinkling is being done in a number of the streets, and after a conference with some of the Aldermen, Commissioner of Public Works Frank M. Westcott stated that the contracts would be rescinded unless the work is done properly.

To Provide for Disposal of Refuse

Indianapolis, Ind.—Dr. C. S. Woods, secretary of the City Board of Health, and C. A. Schrader, president of the Board of Public Works, have taken up the question of controlling the dumping of waste material and rubbish in the city. It is likely an ordinance will be drawn designating public dumping grounds and providing when waste is to be dumped on private property that a permit must first be obtained, and stipulating that only certain kinds of material may be used. The Board of Public Works has ordered dumping in Fall Creek at Indiana avenue to be stopped, and has ordered Gemmer & Henry, city ash contractors, to remove any ashes they may have dumped at that point. The channel of the stream threatens to be narrowed at that point, but the city is having difficulty in handling the situation, owing to the absence of a law on the subject.

Officials Getting Ready to Take Over Street Cleaning

Washington, D. C.—Preparations for a dustless city are being made as rapidly as possible at the District Building, where J. W. Paxton, Superintendent of Street Cleaning, and Captain Mark Broke, Assistant Engineer Commissioner, are getting ready to take over, as a part of the municipal activities, the entire system of street cleaning now in the hands of contractors. Already the white wing section of the city—that is, the downtown district—is being washed and "squeegeed" just twice as often as it was formerly, and when the District does its own cleaning, without the aid of contractors, it is believed that the entire city will have its streets washed. The appropriation, which becomes available July 1, has an item of a quarter of a million dollars for the cleaning work, and authorizes the Commissioners to do without contractors. As the work will have to continue July 1 right where it left off the night before, horses and apparatus are being bought now. With some of the horses now on hand the "squeegee" machines are being worked in double shifts, while the downtown streets are getting the benefit. District officials believe that the washing and scrubbing treatment is the best thing for asphalt streets and believe that the city will be much better cleaned when the entire District can be treated in that way than it has been by the rotary brush treatment.

Montclair to Install New Garbage System

Montclair, N. J.—A sanitary concrete garbage receptacle is being erected under the direction of Engineer Gerardo Immediato on the Garretson farm in Upper Montclair, which it is thought will, when completed, prevent the escape of all disagreeable odors. It is expected that the improvement will be ready for use within 10 days or two weeks. A water pipe is being laid to the new dump. It is proposed that after the last load is brought to the place each night, whatever residue is left in the tank, not taken by the farmers, will be removed and buried in trenches. The tank and platform will then be washed and covered with a sprinkling of quicklime. It is believed that in this way there will be no possibility of either foul odors or flies. For several years the Montclair officials have contemplated the erection of a garbage incinerating plant. A plot of ground near the center of the town has been secured and may eventually be used for the purpose.

Salt Water to Lay Dust

Atlantic City, N. J.—Salt water taken from the meadow streams will be used by the County Board of Freeholders to rid the county roads of the dust nuisance. The efficacy of salt water was discovered after they had expended thousands of dollars in experiments with oily concoctions. It is said the water from certain sections of the meadows has a hardening effect on the road surface.

Municipal Housecleaning Day at Saratoga

Saratoga Springs, N. Y.—Municipal housecleaning days in Saratoga Springs this year are May 26 and 27. On these days the citizens of Saratoga Springs, in fact, each individual who owns property or occupies it, must have his gutter, lawn, yard and surroundings in general in a neat appearance and in harmony with the laws of cleanliness and decency. By having a municipal housecleaning day Saratoga Springs is taking its place beside the long list of cities, towns and villages that have already established this system and are working it to such a degree of perfection as is largely responsible for the good condition and neat appearance of their streets.

Want Streets Cleaned at Night

Chester, Pa.—Committees representing the Edgmont Avenue Business Men's Association, the West Third Street Business Men's Association and the Board of Trade held a joint meet last week for the purpose of forming a joint committee with instructions to confer with Mayor Johnson relative to the project of having the principal streets flushed at midnight. It was stated that in Baltimore, Scranton and a number of other cities the streets were flushed from the fire hydrants at midnight every night, and as a consequence the highways always presented a strikingly neat appearance and were always in a sanitary condition.

RAPID TRANSIT

School Children May Take Two Rides for Five Cents

Shreveport, La.—President W. F. Dillon, of the Shreveport Traction Company, has announced voluntarily that street car tickets hereafter would be sold to school children at the rate of 2½ cents instead of 3 cents each as heretofore. This reduction was one of the concessions mentioned in the company's transfer proposition, which was defeated at the polls recently.

Trolley Line Gets Franchise Over Mayor's Veto

Chattanooga, Tenn.—An ordinance granting to C. E. James and associates and to his and their heirs, executors, administrators and assigns, the right and privilege to construct, equip and maintain street railway tracks and to run and operate by electricity cars thereon on certain streets in the city of Chattanooga, was passed by the City Council last week over the Mayor's veto. The Mayor's message of veto contained five objections, the first of which was to placing a third track on Walnut street. He says that granting the right for a third track on this street is practically abandoning the street to street car lines. The second objection of the Mayor to the ordinance was the placing of a third track on Market street. The third objection stated was that all franchises for the use of streets should provide that the wires be placed underground. The fourth ground of objection was that the ordinance failed to contain a provision against sale or consolidation and to reserve the right to the city to hereafter grant a franchise for a competing line to operate over the tracks provided for in the ordinance, upon the payment of reasonable charges for such service. The fifth objection was that the ordinance does not guarantee to the city interurban lines.

MISCELLANEOUS

Board Urges Five Playgrounds

Syracuse, N. Y.—Action to facilitate the purchase of sites for five playgrounds was taken by the Board of Education at its meeting last week. It is estimated that about \$30,000 will be required to purchase the required properties, and Mayor Edward Schoeneck has declared that he will support any reasonable outlay. In urging the passage of the resolution asking the city to buy the properties on which options have been obtained, or are needed, President Church said that a child had recently been killed near one of the schools where pupils were compelled to play in the streets. This, he declared, was a strong argument for providing playgrounds without further delay.

To Rebuild Famous Bridge

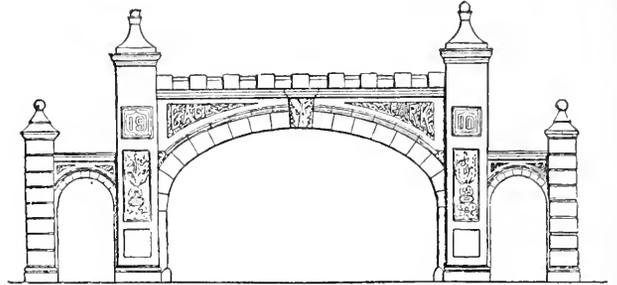

Tarrytown, N. Y.—William Rockefeller has proposed to the taxpayers of North Tarrytown that if they will vote to improve North Broadway he will give \$10,000 to pay part of the expense, and will also give \$10,000 for rebuilding the famous Pocantico Bridge, known all over the world as the "headless horseman's bridge," made famous by Washington Irving. Mr. Rockefeller has long lived in Irving's country—Sleepy Hollow—and he believes that something should be done in his memory. Next year is the hundredth anniversary of Irving's birth.

City Officials Plan an Exhibit

New Orleans, La.—A conference of the heads of various city departments and organizations was held in the big committee room at the City Hall recently regarding the representation of the city at the Chicago International Municipal Congress to be held in the fall at Chicago. Mayor Behrman had been invited to have the city represented and would have acted on the matter sooner if he had not been ill. However, the various heads had been notified and had the matter in their minds. Mayor Behrman explained the idea of the exhibit that is to be given at Chicago, saying that the various cities will have displays that will represent the different phases of municipal progress. The City Council has authorized Mayor Behrman to arrange for an exhibit from this city, and the meeting was for the purpose of arranging details.

Stone Gateway to Park Completed

Topeka, Kan.—The last stone in the construction of the new \$5,000 entrance to Gage Park was laid last week and the archway and mammoth pillars are now ready for public approval. The side wings are yet to be erected. When these are completed the entrance to Gage Park, it is claimed, will surpass that of any park in the West. Even in Chicago the park entrances are inferior when compared to Topeka's new Gage Park structure. In the construction of the new entrance seven cars of cut Bedford stone were used. Some of the massive stones weigh several tons.

NEW STONE GATE FOR TOPEKA PARK

The architecture of the new entrance is beautiful and the high class of workmanship and the finish of the stone gives the entrance a most attractive appearance. The big arch has a 30-foot opening for a driveway, and between the great stone pillars at either side are to be built five-foot arches for the walks. To the east of the entrance is to be built a wing wall of masonry 140 feet in length. This wing will be of Bedford cut stone five feet above a 30-inch concrete foundation. To the west of the entrance will be a shorter wing, but larger stone will be used here. The west wing has a semi-circular effect.

Municipal Ownership of Telephones Endorsed

Ogden, Utah.—At a meeting of the Ogden Chamber of Commerce a unanimous vote was taken in favor of the municipal ownership of local telephones, and a resolution was adopted requesting the City Council to compel the Utah Independent Telephone Company to live up to its franchise, recommending that a copy of the franchise be published in the local papers that subscribers might know to what they are entitled. Another resolution adopted by unanimous vote was in favor of legislative enactment making telephone companies common carriers in Utah.

Boston-1915 Launches Project to Make Civic Center

Boston, Mass.—Boston-1915 has taken up the project of the erection of a building or group of buildings to be centrally located in the city as headquarters for organizations engaged in civic, philanthropic, social or fraternal work. In a letter on this subject that has been issued by James P. Munroe, executive director of Boston-1915, he states that there is a widespread call in Boston for such a building to contain offices, committee rooms, halls and luncheon and dining facilities. Among the organizations interested in such a project he mentions those devoted to business, to civic work and labor interests, improvement associations, fraternal orders, mutual benefit societies, charities, correctional agencies, educational institutions and medical, legal, scientific, engineering and other professional organizations.

Official Gazette Costs City Dear

Spokane, Wash.—The City Commissioners have approved a recommendation for an appropriation of \$5,200 for getting out the official gazette for the remainder of 1911. On this basis the gazette will cost the city about \$7,000 a year if its circulation does not increase, and in addition the city will have to provide for advertising in newspapers as formerly. Much of the advertising must still be printed in newspapers under the State law. The \$5,200 authorized for the gazette includes a salary of \$110 a month for nine months for the editor and for 36 issues of the publication at a total cost of \$4,210.

LEGAL NEWS

A Summary and Notes of Recent Decisions—Rulings of Interest to Municipalities

Contracts—Performance—Extras

Douglas & Varnum vs. Village of Morrisville.—In assumpsit for extras under a dam construction contract in filling a fissure in the bed of the stream, the declaration sufficiently pleaded waiver of a provision of the contract requiring a written order for extras, where it alleged that the extra work was not contemplated when the contract was made and was treated by the parties as an independent undertaking, and that the owner knew of such extra work while it was being done and when the dam was accepted, etc. If one party to a contract knowingly leads the other, even by silence, to believe when he executes the agreement that a certain construction will be put upon it, he is estopped thereby from gainsaying that construction to the prejudice of the other party. A village could waive a provision in a construction contract requiring a written order for extras. A declaration in assumpsit for extras in building a dam is not bad for failing to show compliance with a provision of the contract that disputes should be referred to the owner's engineer, whose decision should be final, where the contractor counts on a subsequent independent verbal agreement concerning the extras. A provision in a construction contract for submission of disputes to the owner's engineer for final decision does not cover disputes not concerning the work itself, but only whether the owner is bound to pay for the work after having received and accepted it. A declaration, under a construction contract, declaring upon an independent subsequent agreement for extra work in consideration of a reasonable price to be paid plaintiffs by defendant is equivalent to an allegation of express promise to pay.—Supreme Court of Vermont, 79 A. R., 391.

Fiscal Management—Warrants—Action

First National Bank of Central City vs. City of Port Townsend, Wash.—The Washington rule that in case of refusal of the treasurer of a municipal corporation to pay a municipal warrant the holder may not maintain an action to recover a judgment on the warrant, but is limited to mandamus to compel the levy of a tax sufficient to pay his claim, is not binding on the federal courts sitting in that State, in which the holder, if entitled to sue therein, may recover a judgment at law as preliminary to enforcement of its warrants by mandamus. A complaint on certain municipal warrants alleged their issuance and the city's refusal to pay the same for lack of funds and averred that the city had neglected to levy in any year since the warrants were issued more than a small fraction of the tax which it was authorized to levy to supply the indebtedness fund with money to pay the warrants and had neglected to levy any tax whatever for that fund in 1909. It did not allege, however, what amount of tax had been collected nor the amount uncollected. Held, that since, under Code, all moneys collected on and after February 1, 1908, for taxes for 1896 and prior years, together with the penalty and interest thereon, were required to be paid into the indebtedness fund, the complaint did not show that the city had broken its contract, or that plaintiff was entitled to mandamus to compel a higher levy to pay the warrants.—United States Circuit Court of Appeals, 184 F. R. 573.

Telephone Franchise—Acceptance

Cumberland Telephone & Telegraph Company vs. City of Mount Vernon.—A city granted to a telephone company a franchise imposing sundry obligations, but for about seven years the company made no attempt to construct or operate a telephone system in the city. An agent was present at the meeting of the City Council which adopted the ordinance, and he requested that it should pass, but it was not shown that he was authorized by the company to accept the conditions of the ordinance. Held, that the company did not accept the ordinance, and an assignment of its franchise passed no rights to the assignee.—Supreme Court of Indiana, 94 N. E. R., 714.

Nuisance—Charcoal Kiln—Abatement

Richards vs. City of Seattle.—That officers of defendant city's health department notified plaintiff that he must cease operating his charcoal kilns unless he installed condensers or retorts within a certain time and posted on the kilns notices to the effect that they were unsanitary, and unless put in a sanitary condition would be destroyed, whereupon plaintiff ceased to use the kilns, did not give him a cause of action for damages, it not appearing that the kilns were destroyed, since if the kilns were not a nuisance the notices were of no effect, and if they were defendant would not be liable for abating them. That charcoal kilns located in a city gave off quantities of smoke and at times poisonous gases of itself established prima facie that the kilns were a nuisance. That there were other nuisances or mills located in the same vicinity in a city which gave off the same gases as, and more smoke than, certain charcoal kilns, did not prevent the city from proceeding to abate such kilns.—Supreme Court of Washington, 114 P. R., 896.

Ordinance Regarding Obstruction of Sidewalks

City of New York vs. Leef et al.—New York City Code of Ordinances, enacted by the Board of Aldermen under Greater New York Charter, prohibits any person from obstructing a sidewalk, except as provided in section 262, without written permission from the Borough President; and section 262 prohibits the placing of merchandise, etc., at a greater distance than three feet in front of a store, except goods being loaded or unloaded, and requires a free passageway for pedestrians. Held, that obstructions must be reasonable with reference to the rights of the public, as well as necessary to the business of the person maintaining them, to be justified under the ordinances.—Supreme Court of New York, 128 N. Y. S., 676.

Restraining Diversion of Water—Laches

Wilson, Attorney General, vs. East Jersey Water Company.—Where municipalities have the right to divert the waters of the streams of the State for municipal purposes, the State is not barred by laches from restraining diversion of water of a stream merely because it stood by for many years and allowed a corporation without objection to acquire riparian lands, establish a filter plant and reservoirs, and lay pipes to supply water to municipalities and to divert the water for the municipalities under contracts to supply them with water; the State not having notice of the contents of unrecorded contracts between the municipalities and the corporation.—Court of Chancery of New Jersey, 79 A. R., 441.

Defective Streets—Definition of Negligence

Stokes vs. Sac City.—An instruction that negligence is the doing of an act which an ordinarily prudent person would not do in like circumstances is erroneous, as ignoring the fact that negligence may consist in careless omission to act.—Supreme Court of Iowa, 130 N. W. R., 787.

Interference with Access to Street

Webb et al. vs. Baltimore & Ohio Railroad Company.—Municipal authorities must preserve to abutting land owners as a constituent part of the general public the beneficial enjoyment of streets by access thereto. An abutter suing for interference with access to his property caused by occupation of a street by a railway company must show the extent of his loss as a basis for assessing damages beyond nominal damages. The right of access is the test of an abutter's right of action for occupation of a street by a railroad. A proper method of ascertaining damage resulting to abutters by obstruction of access to their property through occupation of a street by a railroad was to ascertain what it would cost to restore the means of access by devoting part of the property to that purpose.—Court of Appeals of Maryland, 79 A. R., 193.

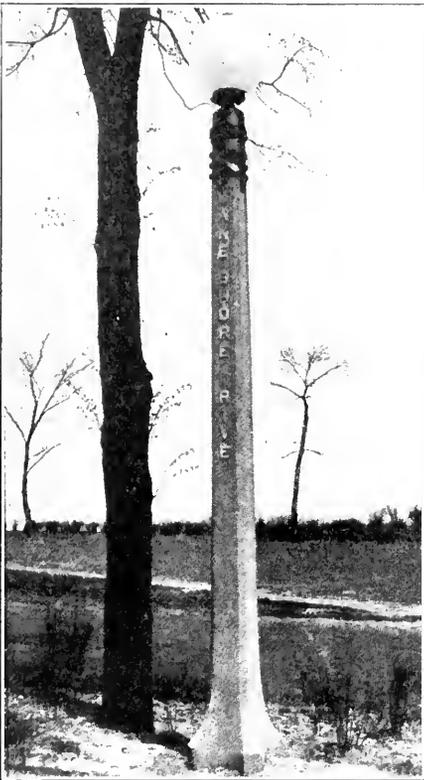

Special Assessment—Installment

Cooney vs. City of Atlanta et al.—An abutting land owner, upon whose property a street assessment is made, is not entitled as a matter of right, under section 150 of the Code of Atlanta, to have his assessment divided into installments, unless the same has been transferred to the contractor doing the work.—Supreme Court of Georgia, 70 S. E. R., 950.

MUNICIPAL APPLIANCES

Concrete Electrolier

M. H. West has recently resigned the position of General Superintendent of the Lincoln Parks System, Chicago, Ill., and has placed on the market through the Western Gardening and Forestry Company, Steinway Hall, Chicago, Ill., a concrete electrolier which he designed. This electrolier, shown in the cut, is artistic, practical and comparatively inexpensive. It has a pleasing, stone-like finish which is permanently retained without the expense of painting. The danger from electrically charged metal is eliminated and the street-marking problem is effectively solved. In parkways especially attractive effects are secured by allowing vines to climb on the posts. The post measures 14 feet from the ground line to the base of

ELECTROLIER AND STREET SIGN

the 20-inch globe, is 9 inches square at the top and 22 inches at the bottom. Aside from the 2-inch pipe conduit, reinforcement is furnished by longitudinal rods conforming with the contour of the post. The globe holder and street-sign letters are of bronze. Either are lamps or incandescent clusters may be used, the special opalescent globe effectually obscuring the mechanism of the lamp, without perceptibly diminishing the lighting efficiency.

Perfection Oil Distributor

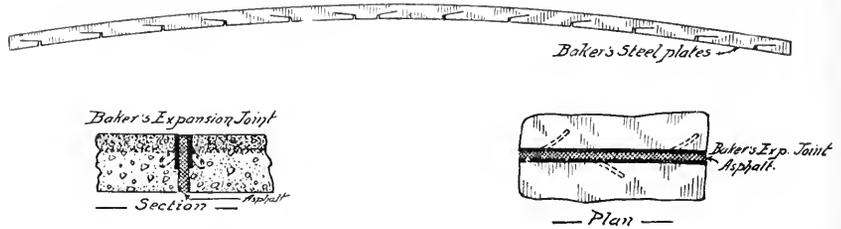

The Perfection oil distributor, placed on the market by the Good Roads Machinery Company, Marathon, N. Y., consists of an inner tank made of heavy boiler plate, enclosed in an outer case. Between the tank and the outer case on all sides and ends there is a fire space varying from 2 inches to 12 inches. All the distributing pipes and

aprons are enclosed in a case and surrounded by heat which keeps up the temperature until the material strikes the stone. Wheels and channels are of iron. The rear wheels have an 8-inch and the front wheels a 6-inch tire, thus affording a rolling surface of 28 inches on the road, which enables carrying the load over the work without tearing up

and forming a bond with it. Asphalt is poured between the plate and the edge of the blocks of concrete on both sides. The result is that expansion is provided for and the steel prevents chipping.

Harrow and Scraper for Roads

The Root Combination Spring Harrow and Scraper, manufactured by the Root Spring Scraper Co., Kalamazoo, Mich., is a device for leveling and smoothing roads. It is especially valuable for use on roads which it is de-

DETAILS OF BAKER ARMORED JOINT FOR CONCRETE PAVEMENTS

the stone and causing ruts. The manufacturers state that by actual test this machine will distribute 300 gallons of material in 30 seconds. The fuel cost of operation per day is about one dollar. The distributor can be regulated for covering any width roadway and for distributing from 1/2 to 2 gallons of material per square yard. Weight of machine, about 2,400 pounds.

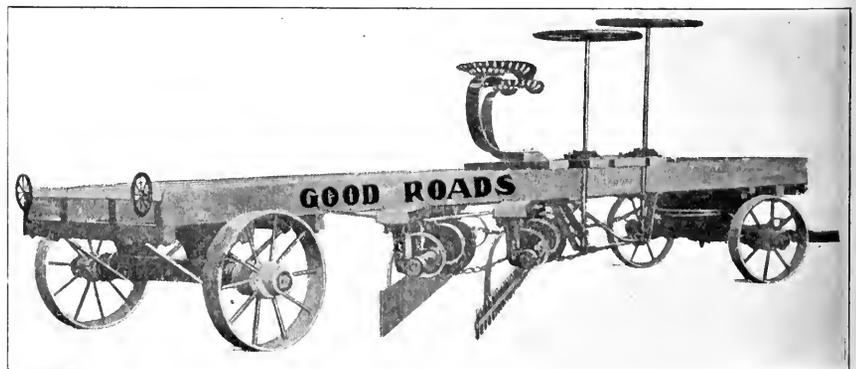

Armored Concrete Pavement

The Thomas Steel Reinforcement Company, Majestic Building, Detroit, Mich., construct a reinforced concrete pavement with specially protected joints which are designed to avoid cracking of the general surface by frost or other causes and prevent chipping from the effects of traffic at the joints that are made to take up expansion. The reinforcing bars of the system are placed at 2-ft. centers at the top of the pavement and at 4-ft. centers at the bottom. At the junction of the 4-ft. spaced rods is a device called the Thomas support and fastener. These supports and fasteners hold the bars firmly in their proper positions.

At the expansion joints are placed Baker armored joints, shown in the illustration, made by the R. D. Baker Company, 73 Home Bank Building, Detroit, Mich. The Baker armored joints may also be used without the reinforcement. The armor plate consists of a band of steel, the upper edge of which conforms to the contour of the street. Narrow strips or tongues are cut from plate, the free ends being bent alternately to right and left, extending into the concrete on both sides of the joint

sired to keep up to a high standard of excellence, for it smoothes out the short waves in the roadway. For such work it is said to be very economical, the claim being made by the manufacturers and confirmed by people who have used it that it saves half of the ordinary labor. The illustration shows the general outlines of the machine. The frame carrying the scraper and harrow is 20 feet long. The wheel base is about 18 feet. The scraper blade is 9 feet long, set on an angle of 45 degrees and held in position by springs. The pressure on the springs forcing the blade down is regulated by chains and a wheel in easy reach of the driver. The harrow is operated in the same way. Both can be used together or separately. For light work on ordinary roads one team and a man are all that are required to operate the machine. Where both scraper and harrow are needed at the same time four horses should be used. The hand wheels at the rear of the machine are attached to truss rods and are used for raising or lowering the same and for holding the frame rigid and level. The hand wheels for operating the harrow and scraper are 24 inches in diameter. Any pressure required can be applied to either, as desired, according to the condition of the road.

These machines are used by the cities of Kalamazoo, Mich., Dayton, O., the Detroit Driving Club, Detroit Mich.; Troy Driving and Speedway Association, Troy, N. Y.; the Orange County Driving Park Association, N. Y.; Michigan United Railway Company, Jackson, Mich., and others.

HARROW AND SCRAPER FOR HIGH-CLASS WORK

Signalphone Fire and Police Alarm System

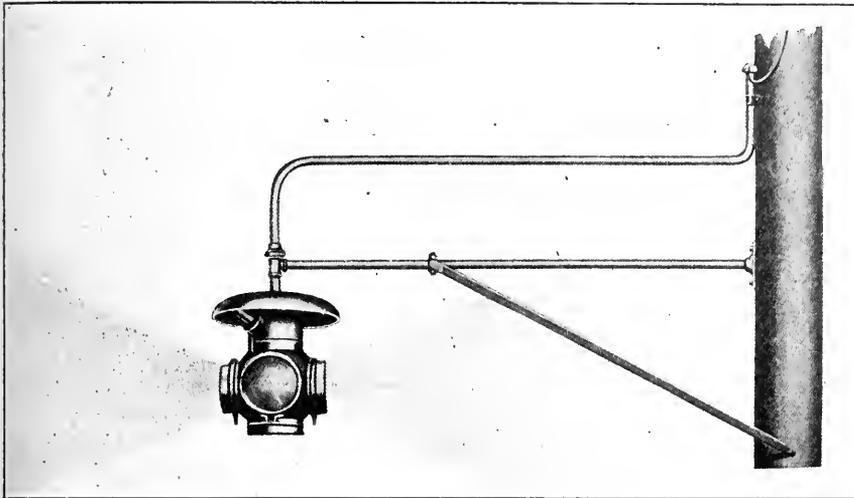

The Signalphone Alarm Company, Milwaukee, Wis., manufacture and install separate or combined fire and police alarm systems. Their Bell-light is a device shown in the illustration to provide means for getting into quick communication with patrolmen on their beats, without waiting for them to make their regular hourly or semi-hourly reports. The Bell-light consists of a four way target signal lamp, in

door hinges; heavy solid brass clock work mechanism, of material which will not deteriorate from the effects of heat, cold or dampness and treated with a coat of finish to prevent corrosion; electro-mechanism protected by a separate dustproof inner case, the face of which is covered with heavy plate glass; mechanism protected against injury from abnormal currents or lightning; means for preventing dangerous electric currents from penetrating exposed metal parts of the in-

Hydraulic Press for Crushing Tests

The Watson-Stillman Company has placed on the market a hydraulic press suitable for testing construction materials, such as hydraulic cement concrete and bituminous concrete, for crushing strength.

This new machine, which we illustrate, is of a common type of hydraulic press, and weighs only 425 pounds, as compared with 3,400 pounds, the weight of material necessary to build the common beam type of machines of equal capacity. The base measures 12 in. by 16 in. and the press is 27 in. high. The cylinder is a steel forging machined to fit down into the reservoir and the pump cylinder is of bronze. This type of testing machine can be carted from place to place on a truck and is also superior to the ordinary compression machines in that all observations can be made by the operator of the pump. He can watch the compression specimen, the pressure gauge and handle the pump simultaneously. This permits rapid work and no waste of time. The operator can also apply the load as rapidly or as slowly as he wishes by corresponding manipulation of the lever. The gauge is graduated to give both the fluid pressure in pounds per square inch and the pressure of the ram on the specimen in tons. A feature of the machine is the ease and quickness with which the ram can be moved to and from the work by means of the lever and connecting links at the left. The small handle at the right furnishes sufficient power where only light pressures are required, while the extension lever applied to this same arm develops pressures up to 30 tons. The platen face is 8 in. square; the platens are 8 in. apart at maximum opening, and the ram movement is 4 in. The machine will therefore accommodate compression cubes or cylinders varying from 4 in. to 8 in. The size to be tested must be left to the discretion of the testing engineer, as it depends upon his estimate of the strength of the mix. A 4-inch cube, which would have to hold 3750 pounds per square inch under a load of 30 tons, is a convenient size for cement and concrete mixtures. The same size would be suitable for asphalt paving mixtures in which sand is the aggregate.

BELL-LIGHT FOR CALLING POLICE OFFICERS

which is located a powerful incandescent light which is controlled from police headquarters. The Bell-lights are also provided with gongs to be sounded in the daytime or foggy weather. The bell serves as a rain-protector for the instrument. The lenses of the light may be green or red; they are 4½ in. in diameter and are located in reflectors on the four sides of the signal lamp. These lights can be installed without a complete police alarm system.

The specifications for the Type 102C fire and police alarm box, shown in the illustration, are as follows: Alarm boxes capable of being used for both departments, each equipped with one headquarters telephone; boxes equipped with trap lock, two keys furnished with each box. All keys uniform; box shells of heavy cast iron, coated with weather-proof enamel paint, having solid brass

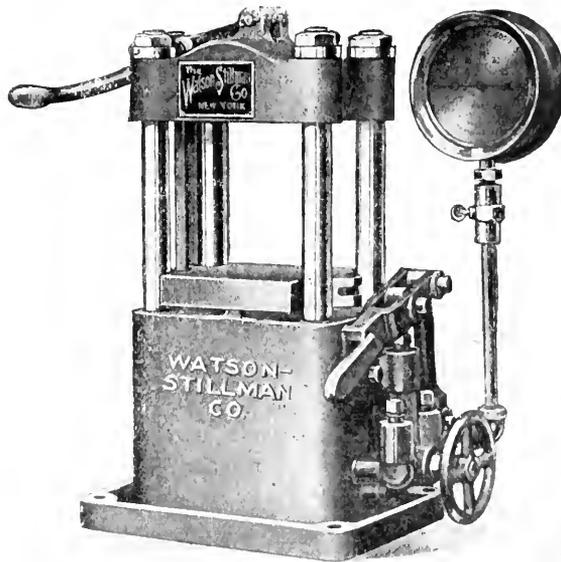

instrument with which users may come in contact; instruments to have a high current carrying capacity; means for obtaining instant telephone communication, without depending upon the signaling mechanism; instruments provided with a trip pull hook, encased in a glass covered compartment, and signaling arrangement which can be operated from the outside of the box, without opening the door, which signal is known as the emergency or patrol wagon call; means for transmitting a signal to distinguish the emergency call from other signals; instruments, equipped with a variable speed changer and regulator, so that transmission of fire alarms may be timed to conform with the receiving capacity of such instruments as may be used in connection with the service. Boxes arranged so that means at headquarters may be operated to automatically record fire alarms at both fire and police stations simultaneously.

The register indicator for engine house service made by this company is a fine instrument. Fire alarm signals are plainly indicated in Morse characters by ¼-inch holes punched in register paper two inches wide. A permanent record of alarms is thus preserved for future reference.

The register is enclosed in a mahogany case with glass front.

COMBINATION ALARM BOX

PRESS FOR CRUSHING TESTS

NEWS OF THE SOCIETIES

National Conference on City Planning.—A booklet was issued describing the leading points of interest along the route of the automobile tour of Philadelphia which took place May 15, the first of the three days' session of the third national conference. The booklet is printed with alternate blank pages on the right-hand side for the convenience of the members in jotting down memoranda. A list of the officers of the conference is printed first, then the members of the local committee on entertainment. Then, in addition to city officials, are representatives of the various civic societies. Automobiles for the tour assembled at the Bellevue-Stratford at 9 a. m. The Parkway, from City Hall to Fairmount Park, already in course of construction, was first visited. Other points of interest were visited in order, as follows: Reading Railroad Tunnel, by which grade crossings on 17 streets were eliminated, and other structures eliminating grade crossings; Fairmount Park; Wissahickon Valley; Walnut Lane Bridge; Cresheim Valley; Main Street, Germantown; Pelham; the Chew House; Wyck; Germantown Academy; Happy Hollow Playground; attention will be called to the prevailing type of two-story house which gives Philadelphia the name of "city of homes"; Torresdale Boulevard.

Intermountain Good Roads Association.—The annual convention will be held in Pocatello, Ida., June 22-24. A conference of the State board of road commissioners, in conjunction with the good roads committee of the Salt Lake Commercial Club and representatives of the Utah Development League, was recently held in the offices of Governor William Spry. The following members of the State board are in charge of the campaign for good roads: Governor William Spry, chairman; Caleb Tanner, state engineer, secretary; R. R. Lyman, vice-chairman; J. W. Jensen of Logan and David Mattson of Ogden.

International Firemen's Tournament. The Department of State is in receipt of a dispatch from the American ambassador at Rome, dated April 5, 1911, transmitting a translation of a letter to him from the mayor of Turin inviting American firemen to take part in the international contest to be held in Turin in the Summer during the exposition. In transmitting this communication the ambassador expresses the opinion that possibly some enterprising manufacturer of fire engines may be induced to send over a modern fire engine with a competent force to work it, which might lead to an extensive and profitable foreign trade.

The letter from Senator Theophile Rossi, mayor of Turin, to Ambassador Leishman follows:

"On my last visit to Rome I had the honor of explaining to your secretary the desire of our municipality to have at Turin American firemen on the occasion of the International Fireman's Tournament, which will take place during our exposition.

"For this tournament we are already assured the participation, among others, of French, English and German firemen, and we should be delighted to admire among them firemen of your nation, whose courage and modern system have such a brilliant reputation among us."

Massachusetts Highway Association.—Engineers and superintendents of street construction and maintenance from all sections of the State gathered in Springfield, Mass., May 11 on the occasion of the quarterly meeting of the association. The session was held in the Hotel Kimball, where dinner was served at 1.30 o'clock, followed by a paper and discussion, after which the members were given automobile trips about the city. About 150 members of the association were in attendance. It had been planned to have the meeting in connection with the annual New England conference on street cleaning that is to be held here this month, but the date of the latter was postponed until May 17.

The highway association members convened in Worcester during the morning and made the trip from Worcester to this city in automobiles. About a dozen autos from Springfield were taken to Worcester in the morning to meet the guests and 15 or more cars were provided there, all coming through without mishap. They left Worcester just before 10 o'clock and the advance guard arrived at Springfield about 12:30 o'clock, all being accounted for by 1 o'clock.

Members of the State Highway Commission were in the party and all viewed with satisfaction the good work that has been done the last year on the State roads between Worcester and this city. In Palmer a stop was made to witness a demonstration of an oil distributor on the State highway easterly of the railroad station.

The affair was limited to members of the association, the only guests at the dinner being Alderman Edward S. Goldthwaite and Councilman Edward T. Broadhurst, representing the local board of supervisors. Arthur A. Adams, until recently superintendent of streets, has been a prominent member of the association and was instrumental in having the quarterly gathering held in Springfield, for which he made the arrangements.

Harold Parker, of Lancaster, president of the association, presided at the dinner. The program which followed consisted of a paper by James H. Sullivan, superintendent of streets of Boston.

Halifax County, N. C., Good Roads Association.—At the recent meeting at Weldon the following officers were re-elected: President, John L. Patterson, Roanoke Rapids, N. C.; vice-president, Geo. C. Green, Weldon, N. C. The president outlined the work the association had accomplished during the past year in part as follows: The holding of several meetings, changing the road law, securing a law authorizing a bond issue of \$300,000, securing lecturers for three addresses on road building, personal work in creating interest in good roads. The president suggested that a map of the county be made, of the expense of which the State and Federal governments will each bear one-quarter.

Natural Gas Association.—The seventh annual convention will be held in Pittsburg, May 16-18. The National Tube Company has arranged for an excursion for the members, May 18, on the steamer Sunshine, visiting the plant at McKeesport. The party will return in the evening so as to give the guests an opportunity of seeing the illuminations from the furnaces and mills along the banks of the river.

Playground Association of America.—The fifth annual meeting was held in Washington, D. C., May 11-13. Playgrounds experts from cities in all parts of the country are gathered to attend the meeting. The secretary's report indicated that playgrounds generally from one end of the country to the other had attracted more attention and received more financial backing than during any previous year of the association's existence. Thirty-two cities now employing 643 workers are actively engaged in playgrounds work. In the past twelve months about \$3,000,000 was spent in 184 cities for the improvement and establishment of playgrounds.

The name of the association was changed by a unanimous vote of the attending delegates to the Playground and Recreation Association of America. The change in title was brought about through the efforts of the association's officers for the reason that simply as the Playground Association the organization has outgrown its sphere of work. The association's work now embraces everything pertaining to recreation, in addition to the control and establishment of playgrounds.

The following officers and directors were elected for the ensuing year:

Honorary president, Theodore Roosevelt; president, Joseph Lee; first vice-president, Harold F. McCormick; second vice-presidents, Mrs. Lovell White and William D. Kent; third vice-president, Robert Garrett; treasurer, Gustavus T. Kirby. Directors—Mrs. Caroline B. Alexander, Hoboken, N. J.; Mrs. Samuel A. Ammon, Pittsburg, Pa.; Otto T. Bannard, New York City; Mrs. Emmons Blaine, Chicago, Ill.; Thomas F. Cooke, Buffalo, N. Y.; George W. Ehler, Madison, Wis.; Lee F. Hanmer, New York City; George E. Johnson, Pittsburg, Pa.; Representative William D. Kent, Kentfield, Cal.; Joseph Lee, Boston, Mass.; T. S. Lippy, Seattle, Wash.; Joseph E. Raycroft, Chicago, Ill.; Myron T. Scudder, New Brunswick, N. J.; Seth T. Stewart, Brooklyn, N. Y.; John Wanamaker, Philadelphia, Pa.; Edward J. Ward, Madison, Wis.

International Municipal Congress and Exposition.—An event of interest to officials of cities, contractors and manufacturers who sell goods to cities and citizens who are interested in the way their municipalities are run is promised in the Congress and Exposition in Chicago September 18-30 next. Enterprising citizens of that progressive city have issued a call for all students of city government to assemble at the congress for full discussion of the problems with which cities find themselves confronted. In connection with this the exposition has been arranged at which the foremost cities of the world will exhibit features of their administration and at which equally important exhibits will be shown by manufacturers of every variety of article used in the government of a municipality.

Chicago itself will have an important exhibit. New York will display its budget exhibit. There will be stereopticon views of Berlin. Paris and London will exhibit. Boston, Philadelphia, Cleveland, Toledo and Detroit have arranged to take space. Des Moines will have stucco models of its civic center and river front. Denver, Memphis and New Orleans will be represented. The California League of Municipalities will give a demonstration of what its cities are doing. Spokane and Seattle will exhibit. Moving pictures of Winnipeg will be shown.

Calendar of Meetings

- May 18-19.**
Ohio Society of Mechanical Steam and Electrical Engineers.—Annual Convention, Youngstown.—F. E. Sanborn, Secretary, Ohio State University, Columbus.
- May 23-25.**
National Fire Protection Association.—Annual Meeting, New York City.—F. H. Wentworth, Secretary, 87 Milk St., Boston.
- May 23-26.**
National Good Roads Association.—Fourth National Good Roads Congress, Birmingham, Ala.—J. A. Rountree, Secretary, Birmingham, Ala.
- May 25-26.**
League of Second and Third Class Cities of New York.—Poughkeepsie, N. Y.
- May 29-June 2.**
National Electric Light Association.—New York City.—T. C. Martin, Secretary, 31 West 39th St.
- June 5-14.**
National Probation Officers' Association.—Boston, Mass.—Roger N. Baldwin, Secretary, 903 Security Building, St. Louis, Mo.
- June 6-8.**
Engineers' Society of Pennsylvania.—Annual Meeting at State College, Pa.—E. R. Dasher, Secy., P. O. Box 704, Harrisburg, Pa.
- June 6-10.**
American Water Works Association.—Thirty-first Annual Convention, Powers Hotel, Rochester, N. Y.—John M. Diven, Secretary, 14 George street, Charleston, S. C.
- June 7-14.**
National Conference of Charities and Correction.—Boston, Mass.—Alexander Johnson, Secretary, Ft. Wayne, Ind.
- June 7.**
National Association for the Study and Prevention of Tuberculosis.—Denver, Col.—Dr. Livingston Farrand, Executive Secretary, 105 East Twenty-second street, New York City.
- June 11-16.**
International Association of Chiefs of Police.—Eighteenth Annual Convention, Rochester, N. Y.—Major Richard Sylvester, Superintendent of Police, Washington, D. C., President.
- June 13-18.**
New York State Association of Chiefs of Police.—Annual Convention, Rochester, N. Y.
- June 13-16.**
American Society of Civil Engineers.—Annual Convention, Chattanooga, Tennessee.—Charles Warren Hunt, Secretary, 220 West 57th St., New York.
- June 21-22.**
National Conference of Poor Law Officials.—Boston, Mass.—Dr. Robert W. Hill, President State Board of Charities, 105 East Twenty-second street, New York City.
- June 22-24.**
Intermountain Good Roads Association.—Annual Convention, Pocatello, Ida.—Caleb Tanner, State Engineer.
- August 15-18.**
Firemen's Association of the State of New York.—Watertown, N. Y.—A. H. Otto, Secretary.
- September 12-15.**
International Association of Municipal Electricians.—Annual Convention, St. Paul, Minn.—Clarence R. George, Secretary, Houston, Tex.
- September 18-30.**
International Municipal Congress and Exposition.—Chicago, Ill.
- September 19-22.**
International Association of Fire Engineers.—Annual Convention, Racine, Wis.
- September 19-22.**
American Hospital Association.—New York City. J. N. E. Brown, M.D., Secretary, Toronto General Hospital, Can.
- September 24-30.**
International Congress on Tuberculosis.—Rome, Italy.—Professor Ascoli, Secretary-General, Via Lucina, Rome, Italy.
- September 26-29.**
American Society of Municipal Improvements.—Grand Rapids, Mich.—A. Prescott Folwell, Secretary, 239 West Thirty-ninth street, New York City.
- October 4-6.**
League of American Municipalities.—Annual Convention, Atlanta, Ga.—John MacVicar, Secretary, Des Moines, Ia.

PERSONALS

BEDFORD, L. A., has been elected Mayor of Eastland, Tex.

BRANCH, D. E., was re-elected Mayor of Franklinton, La.

CATLIN, F. M., has been appointed a member of the Board of Police Commissioners of St. Paul, Minn., succeeding Fred N. Dickson, resigned.

CHRISTY, LLOYD B., is the new Mayor of Phoenix, Ariz.

ECKLEY, SHERMAN, has been appointed commissioner of public works of Peoria, Ill. He succeeds George F. Simmons.

EDMUNDSON, C. L., Mayor of Bisbee, Ariz., has resigned.

FIELDS, W. E., has been elected Mayor of Lockhart, Tex.

FREELAND, JOSEPH H., is the new Mayor of Burlington, N. C.

GUNN, SELSKAR M., instructor of bacteriology and public health, Massachusetts Institute of Technology, has been secured by the Milwaukee Bureau of Economy and Efficiency to take charge of the investigation of present health conditions and to work out a final reorganization of the health department. Mr. Gunn is a graduate of the department of biology and public health, Massachusetts Institute of Technology.

HARDING, COLLIN H., was elected Mayor of Washington, N. C., as a result of a very quiet election, there being no contesting candidates.

HUMBER, GEO. H., is the new Mayor of Carthage, N. C.

JOHNSON, JAMES, has been elected Mayor of Raleigh, N. C.

JORDAN, W. S., is the new Mayor of Jacksonville, Fla.

LEDWICH, JAS., has been elected Mayor of Broken Bow, Neb.

KERCH, C. V., has been reappointed City Engineer of Janesville, Wis.

KEYSER, D. S., has been elected Mayor of Napa, Cal.

MCALLISTER, A., Democratic mayoralty candidate of San Luis Obispo, was elected.

MCCARTY, MAJ. JAMES, has been employed as consulting engineer by the Hudson Falls, N. Y., board to report on a new water system.

MATTHEWS, LEE R., is the new Mayor of Pomona, Cal.

MEGUIRE, E. N., was elected Mayor of Portland, Tenn.

MORGAN, W. L., was elected Mayor of Black Mountain, N. C., by a majority of one vote. The voters of that township found that he was a non-resident and the office of Mayor passed to Mr. Morgan's opponent, Mr. W. C. Hall. Morgan's exact status was determined when he went to the polls to vote, the registrar refusing him the privilege to vote on the ground that he was not a resident of Black Mountain township. Subsequent investigation revealed the fact that three months ago Mr. Morgan moved across the corporate limits while his old residence was being torn down to make place for a new one.

MURDOCK, ALLEN C., was elected Mayor of Parkersburg, W. Va.

POUJADE, J., has been elected Mayor of Carson, Nev.

RUARK, J. W., is the new Mayor of Sanford, N. C.

SANDERSON, FRED T., was elected Mayor of Klamath Falls, Ore.

TORNEY, WM. J., is the new Mayor of Vallejo, Cal.

TURBITTIN, R. C., has been elected Mayor of Reno, Nev.

WISE, JOHN W., is the new Mayor of Chester, S. C.

American Museum of Natural History.—A special exhibition of apparatus, models, charts and diagrams illustrating the work of the Metropolitan Sewerage Commission and signaling the inauguration of the Department of Public Health of the American Museum was opened at the Museum, 77th Street and Central Park West, New York City, May 15. Addresses were made by President Osborn, Mayor William J. Gaynor, Dr. George A. Soper, president of the Metropolitan Sewerage Commission; Professor C. E. A. Winslow, curator of the new Department of Public Health of the Museum, and Dr. Harvey W. Wiley, of the United States Department of Agriculture. The exhibition will be open for one month.

National Electric Light Association.—A catalogue exhibit will take the place of the usual exhibition at the convention in New York City, May 29-June 2. The exhibit will be held on the fifth floor of the Engineering Societies' building. Applications for space must reach the secretary not later than May 15.

National Board of Fire Underwriters.—At the forty-fifth annual meeting of the National Board May 11, in the New York Board rooms, No. 123 William Street, the instructing of school children in the importance of handling household combustibles, abolishing of dangerous matches and the punishment of careless cigarette smokers as measures which would greatly reduce the fire losses of the nation, were advocated. A. W. Damon, of Springfield, Mass., president of the organization who urged the instruction for school children, also recommended the enactment of State fire marshal laws by all of the States, modern building laws, legislation to impose stricter regulations regarding the storage of explosives and improved water supply.

Mr. Damon said, in part:

"Nebraska and Montana have followed Ohio in instructing school children as to the importance of observing greater care in the handling and use of those household commodities which are so often the cause of fires. Other States are considering the matter and could well afford to follow the examples of these Commonwealths."

"The Criminal Match" was treated in a resolution introduced by Louis S. Amonson, of Philadelphia, who urged the abolishing of dangerous matches from the household. In another resolution it was urged that laws be enacted to provide that persons who throw away lighted cigarettes and thereby start fires be held responsible.

M. O. Brown, of New York City, chairman of the Committee on Laws, declared that legislators should devote more time to preventing fire waste by the enactment of laws which would compel citizens to recognize their individual responsibility for fires. George W. Hoyt, chairman of the Committee on Fire Prevention, urged the adoption of a national building code.

These officers were elected: George W. Babb, New York, president; William N. Kremer, New York, vice-president; C. J. Holman, New York, treasurer; E. W. West, Glens Falls, N. Y., secretary; E. H. A. Correa, New York City; E. J. Richards, New York City, and Edward Milligan, Hartford, Conn., members of the Executive Committee. There were 135 insurance companies represented at the meeting.

INDUSTRIAL NEWS

Cast-Iron Pipe.—Chicago.—Conditions are decidedly better. Good orders have recently been closed with a number of cities. Prospects for a good pipe season brighter as the year advances. Quotations: 4-inch, \$25.50; 6 to 12-inch, \$24.50; 16-inch and up, \$24. Birmingham—The week has been a very satisfactory one. Prices are firm. Quotations: 4 to 6-inch, \$22.50; 8 to 12-inch, \$22; over 12-inch, average \$21. New York—The demand shows no improvement and transactions are small. Quotations: 6-inch, carloads, \$21 to \$22.

Lead.—Market is weak. Quotations: New York, 4.40c.; St. Louis, 4.25c.

Wire Brooms.—The Osborn Manufacturing Company, Cleveland, O., has purchased the business and patents of the American Wire Brush Company, 277 Greenwich street, New York. A new office and factory will be established at 202 Centre street, New York City. F. D. Jacobs will be in charge of the New York office.

Road Machinery.—To handle more efficiently its increasing business in the Middle West, the Iroquois Iron Works, of Buffalo, N. Y., have established a warehouse in Chicago, where a complete line of macadam and tandem rollers, asphalt tools, kettles, etc., is now carried for immediate shipment. The new shipping depot is in charge of T. H. Morris, the Chicago representative of the Iroquois Iron Works, with offices in the Tribune Building.

Water-Sterilizing Plant.—H. A. Cammer of the Seneca Falls Water Works Company, Seneca Falls, N. Y., has replied to a communication from the village officials asking if the company contemplated installing a purification system and asking for a revision of rates. Mr. Carmer replied that, although the water had been pronounced good on several occasions when tested, the company were considering the installation of some sterilizing process when such action was desired. Regarding the rates he said no reduction was possible unless the village sees fit to grant the company a contract.

Oil-Pressure Sprayer.—Street Commissioner McPhetres, Lynn, Mass., recently attended an experimental test of the Standard Oil Company's asphalt oil-pressure sprayer on Johnson Street, Lynn, given by David O'Brien, of Boston, agent for the company. The machine, after a few false starts, appeared to make good the claims made for it by its promoters. As regards costs, they claim that two applications a year will keep a street free from dust at an estimated cost of 2¾ cents per square yard.

Granite Paving Blocks.—Owing to the increased popularity of the granite paving block among city officials granite cutting sheds along the Maine coast have opened for regular production of the standard paving block during the Summer season. The boom in this branch of the State's granite industry was felt in the larger cities of the coast, and many sheds that had felt the business depression for a number of years were started at full capacity. The new paving block is cut with greater care and is smaller than the original. The new block is popular as piece work with the cutters.

Granite Blocks.—The American Granite Company is being organized at Augusta, Ga., with a capital stock of \$600,000, for the development of 100 acres of granite property near Augusta. Charles F. McKenzie will be president of the company, which will install a modern plant.

Universal Nozzle.—J. M. Camerson, Johnson City, Tenn., has invented a universal nozzle for use on fire hose. Arrangements are being made for its manufacture, following several successful demonstrations.

Calcium Chloride.—The Solvay Process Company, Detroit, Mich., is engaged in the construction of one of the largest additions to its mammoth plant of any undertaken in this city for several years. The building is an entire steel structure, three stories, and covering about seven acres.

Water-Works Specialties.—The H. W. Clark Company, Mattoon, Ill., manufacturer of meter boxes and other water-works specialties, has been incorporated with a capital stock of \$50,000. The incorporators are Horace W. Clark, Charles H. Tillotson and Dwight P. Child.

Auto Fire Engine Tested.—The new Robinson automobile fire engine of the Water Witch Fire Company, Wilmington, Del., was given a test last week at West Street and Park Drive, when it gave a good account of itself. Although there was a stiff wind blowing, the engine threw a stream through a nozzle, an inch and a quarter in diameter, a distance of 225 feet, with a water pressure of 150 pounds. This was continued, without variation, for 45 minutes, and could have been continued longer. The stream was siamesed through two lines of hose.

Gasoline Motor Truck.—A decision of the Fire Commission, Springfield, Mass., last week, came as the result of careful investigation by department officials of apparatus used in other cities. An arrangement has been made by the commission with the Knox automobile concern, by which the company offers to build a three-wheeled gasoline tractor for the water tower now stationed at the Pynchon Street house. At present this piece of apparatus is horse-drawn. This tractor, which is an experiment by the Knox people, who have never yet attempted to manufacture this particular class of apparatus, will be furnished to the city for its free use from the time of its completion until March 12, 1912. The commission reserves the right to return it to the company at any time prior to that date, if it so desires, but if it proves satisfactory the purchase will be made.

Reinforced Concrete Sewers.—The bulletin of the Universal Portland Cement Company for May contains illustrations of Meriwether reinforced concrete pipes in course of construction at Niagara Falls, N. Y. The pipes were made in molds furnished by the Lock-joint Pipe Company, New York. R. A. McClanathan was the City Engineer and W. A. Shepard & Co., Niagara Falls, the contractors. The bulletin also contains an illustration of the Dickinson Street reinforced-concrete bridge at Syracuse, N. Y.

General Asphalt Company.—Evidence of the continued success of the present management of the General Asphalt Company is contained in the eighth annual report of the company, for the fiscal year ending April 30. Gross earnings for 1910 were \$16,004,173, exceeding the gross of the preceding year by \$2,011,190. Net earnings were \$1,102,075, as compared to net of \$1,031,741 in 1909.

The progress made in the complete rehabilitation of the Asphalt Company's affairs is further evidenced by the fact that the 5 per cent. dividends on the company's \$13,140,000 of preferred stock paid during the year make a total cash disbursement for dividends since the company was organized of 20¼ per cent. This, with the 8½ per cent. cumulated dividends (represented by the 5 per cent. debentures issued March, 1911), makes a total distribution of 28¾ per cent. Dividends on the preferred stock became cumulative at the rate of 5 per cent. from June 15, 1905; so that with the payment of the regular 1¼ per cent. on June 1, 1911, 30 per cent., the full dividend for six years past, will have been paid in cash or by debentures.

The Barber Asphalt Paving Company constructed 2,349,917 square yards of new sheet asphalt pavements during the year, and 1,341,047 yards of private work and paid repairs, an increase, taking the two classes of work together, of 560,000 yards over 1909. These figures do not include contracts for 1,687,788 yards carried over to the present year.

Referring to the deduction from net earnings for maintenance guarantee account, the report points out the steady diminution of guarantee periods, which have been reduced from ten years or more to an average of 3.5 years on the work done by the Barber Asphalt Company in 1910. In 1910-11 guarantees expired on more than 7,510,000 yards, on which the average period of guaranteed maintenance was 7.5 years. With the large yardage going out of maintenance each year, accompanied by the adoption of much shorter guarantee periods or their entire elimination, it is pointed out that the company's obligations in this respect will be largely reduced or entirely done away with.

The first public announcement is made in the report of the discovery of immensely valuable oil deposits on the company's property adjoining the Trinidad asphalt lake. A small amount of oil had been obtained up to September of last year, when a well being bored, and then at a depth of 915 feet, began to produce oil at the rate of 3000 barrels a day. With this proof of the existence of an extensive supply of asphaltic oil for fluxing, fuel and road treatment, the company began the construction of storage tanks of 1,000,000 barrels capacity and chartered three tank steamers, the first of which will arrive in this country this month with oil cargoes. The report refers to the finding of the Trinidad oil as "an asset hitherto wholly undeveloped, which is already of proven value, and which possesses great possibilities for the future."

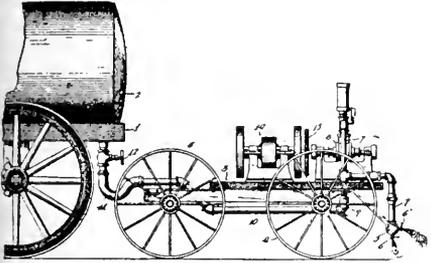

Aside from this oil discovery, the main development in the company's business as shown in the report, relates to the increasing use of asphalt in macadam road construction, the tonnage of Bermudez road asphalt being eight times greater in 1910 than the total for 1909. The outlook for the season of 1911 is considered as very encouraging.

(Continued on page 738.)

PATENT CLAIMS

991,043. PROCESS OF MAKING ROADWAYS. Joseph E. Ward, Longbeach, Cal. Serial No. 549,347.

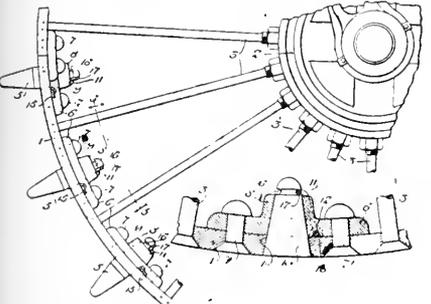

The process of making a roadway which consists in atomizing oil in contact with air in such a manner that the oil tends to remain suspended in the air for an appreciable time, bringing the atomized oil and air into contact with a porous road

surface, causing the oil to permeate the porous road surface while still in atomized condition, and causing the atomized oil to be deposited on the material of the road surface while said material is agitated and partly suspended.

990,846. ROAD ROLLER. Henry F. Crandall, Racine, Wis., assignor to J. I. Case Threshing Machine Company, Racine, Wis., a Corporation. Serial No. 601,619.

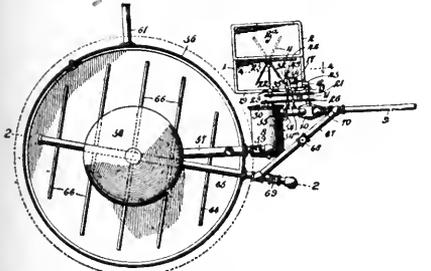

In road rollers, the combination of the roller rim having tapered seats at suitable

intervals extending therethrough, removable spike teeth having tapered shanks fitting said seats, and spring keepers detachably engaging the inner ends of said spike teeth.

991,990. APPARATUS FOR SOFTENING WATER. Axel R. Holmén, Columbus, Ohio. Serial No. 495,033.

An apparatus of the class described including a settling tank, a mixing chamber arranged exteriorly of the settling tank and connected therewith, means for supplying water under pressure to the mixing chamber, a motor connected with and oper-

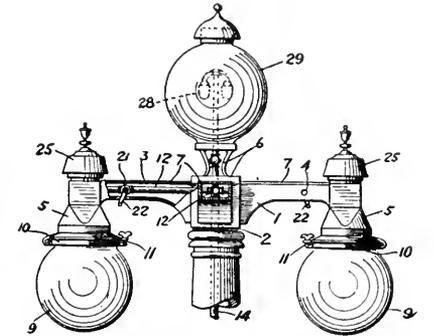

ated by the water supply, a solution tank also arranged exteriorly of the settling tank, a pump operated by the motor and connected with the mixing chamber and having an inlet pipe communicating with the solution tank, and a by-pass pipe extending from the water supply to the inlet pipe.

991,767. APPARATUS FOR PRODUCING OZONE. Charles G. Armstrong, Orange, N. J. Serial No. 496,310.

In a device of the class described, a condenser having in combination a plurality of relatively narrow positive and negative conductors, a plurality of solid dielectrics interposed one between each two adjacent conductors, said dielectrics and conductors being spaced apart to form a plurality of independent air passages, means for supplying an electric current to said conductors, and means for forcing air through the spaces between the dielectric plates from one side thereof to the other, whereby the air will cross said conductors transversely and is subjected to but one electrostatic action.

990,680. STREET LAMP. Henry E. Strelber, Canton, Ohio, assignor to The Sun Vapor Street Light Company, Canton, Ohio, a Corporation of West Virginia. Serial No. 602,893.

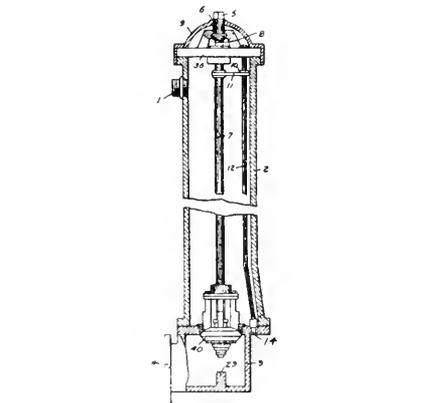

A lamp consisting of the combination of a hollow casting having attaching provisions and having trough-like arms radiating from said attaching provisions and terminating in a vertically arranged outer lamp shell, a globe for closing the lower part of the outer shell, a ventilator at the top of the outer shell, a gas pipe arranged in the arm and

depending through the outer shell and having a regulating valve and radiating air supply pipes or ducts, an inner shell arranged within the outer shell and joined to the top thereof with space between and through which said pipes or ducts extend, said spaces receiving air and supplying the same to the ducts or pipes and to the globe, incandescents or mantles arranged at the lower end of the inner shell, and detachable covers for the trough-like arms.

991,559. FIRE HYDRANT. William H. Symons, San Diego, Cal. Serial No. 586,979.

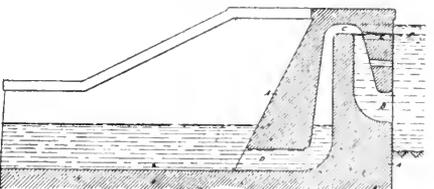

In a fire hydrant, a stand pipe, a funnel-shaped nozzle base extending outwardly from the stand pipe with its small end outwardly; said small end being internally screw-threaded, a nozzle bushing screw seated in the nozzle base and having an external screw-thread on its outer end to receive a hose coupling and having a valve seat upon its inner end, and there being an opening through the opposite side of the stand pipe in alignment with the opening through the bushing; the surface around

the inner end of the opening being finished to form a tight joint, and the surface around the outer end of the opening being finished to receive a lock nut, a valve frame mounted in said aligned opening and adapted to form a tight joint with said inner finished base and having an external screw-thread on its outer end and a lock nut on said external screw-thread, so that by removing the bushing and removing the lock nut the valve frame may be removed through the bushing opening.

991,907. SPILLWAY. George F. Stickney, Albany, N. Y. Serial No. 615,736.

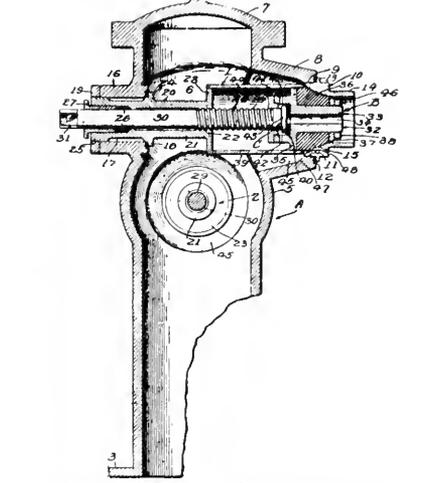

A spillway comprising a dam; a closed conduit siphon of an inverted U-shaped form when in position, the crown being

between the low and high water planes; said dam provided with an air passage extending from at the low water level to a point in the siphon near the crown.

991,690. GATE VALVE. Charles L. Bowker, Brunswick, Me. Serial No. 554,333.

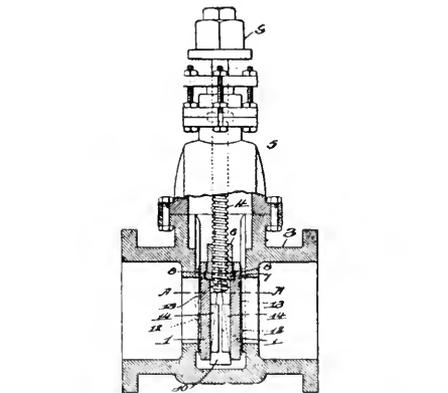

A gate valve, having, in combination, a valve casing, oppositely disposed valve seats in the casing, a valve chamber between said valve seats, valve disks in the valve chamber provided with inclined surfaces on their inner faces, wedge-shaped ribs arranged vertically in said chamber on opposite sides of the water-way and co-

operating with the inclined surfaces upon the valve disks to force the disks against their seats when the disks are lowered, and means located upon opposite sides of the valve chamber operating to force the valve disks away from their seats as the disks are raised, substantially as described.

990,989. FIRE HYDRANT. John Knickerbacker, Troy, N. Y., assignor to Eddy Valve Company, Waterford, N. Y., a Corporation of New York. Serial No. 501,999.

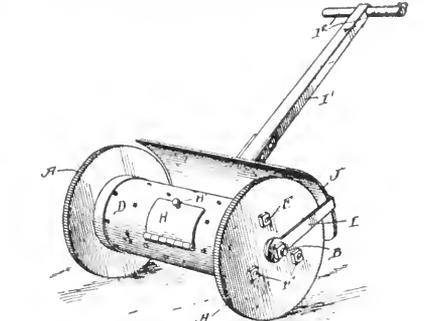

A hydrant comprising a stand pipe, a main valve to control admission thereto, a dash pot carried by said main valve, an

auxiliary valve connected with said dash pot and having a seating surface to further control admission to said stand pipe and a portion on said auxiliary valve arranged to substantially check admission before said seating surface becomes effective.

991,790. DEVICE FOR DISTRIBUTING ASHES AND SAND. Samuel M. Lampke, Detroit, Mich. Serial No. 563,221.

A device for distributing ashes and sand, comprising a pair of wheels having outwardly projecting journals, a perforated drum arranged between said wheels and

carried thereby, a handle frame pivotally mounted on said journals, a handle carried by said frame and a curved apron carried by said handle frame having a length greater than the distance between said wheels.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
STREET IMPROVEMENTS				
Ohio	Cincinnati	May 19, noon	Constr. Compton rd. in Hamilton Co.; mac. exten. of Strubler rd	Stanley Struble, Pres. Co. Comrs.
New Jersey	Camden	May 19, 8 p.m.	Constructing cement sidewalks and driveways	Joshua C. Haines, Chm. Police Comr.
Ohio	Akron	May 19, noon	Paving portions of various streets	John W. Gauthier, Dir. Pub. Serv.
Ohio	Columbus	May 19	Paving portion of Summit St.	H. S. Holton, Dir. Pub. Service.
New York	New York	May 19, noon	Furn. granite stone for bulkhead or river wall	Calvin Tomkins, Comr. Docks.
New Hampshire	Concord	May 19, 1 p.m.	Paving 3½ miles with native stone in the town of Hillsdale and paving 4,500 ft. in the town of Bethlehem	H. C. Hill, State Engr. City Clerk.
New York	Walden	May 19, 8 p.m.	Constructing concrete sidewalks on various streets	W. H. Morton, Secy. Park Board.
New York	Utica	May 19, 10 a.m.	Oiling two drives of Utica parkway	
Pennsylvania	Dormont	May 19, 8 p.m.	Grading, curbing and paving, including 4,700 cu. yds. grading, 3,900 lin. ft. curb and gutter, 4,500 sq. yds. paving	H. M. Stille, Chm. Street Com.
Pennsylvania	Pittsburg	May 19, 10 a.m.	Furn. 100,000 gals. light asphalt road oil; 100,000 gals. heavy asphalt oil; 922,000 brick block for the Crooked Road Run; two all steel tank wagons of 600 gals capacity	R. J. Cunningham, County Compr.
Illinois	Mendota	May 20, 2 p.m.	Hauling about 5000 tons of material for constructing gravel rock and macadam roads from railroad and distributing along county roads in Mendota, township	Commissioners Highways.
Indiana	Evansville	May 20, 10 a.m.	Laying and repairing concrete and brick sidewalks	Simon A. Bartholome, Clk. B.P.Wks.
Arizona	Phoenix	May 20	Constr. territorial road from Tucson to Bisbee	Robt. W. Craig, Secy. Bd. Control.
Ontario, Can.	Kingston	May 20, noon	Constructing 6,100 sq. yds. pavement; 2,276 lin. ft. curb and gut	H. B. R. Craig, City Engineer.
New York	Chatham	May 20	Constructing a section of highway known as Rowe Hill	A. P. Tripp, Town Clerk.
Ohio	Cleveland	May 20, 11 a.m.	Grading, draining and improving portion of Settlement Road	John F. Goldenbogen, Clk. B. C. C.
Minnesota	Pelan	May 20, 2 p.m.	Turnpiking and graveling road No. 138	A. P. Erickson, County Auditor.
Ohio	New Philadelphia	May 22	Paving the New Cumberland Road with brick	City Clerk.
Ohio	Cincinnati	May 22, noon	Grade, cement park lot surrounding Public School	C. W. Handman, Business Manag'r.
Texas	Galveston	May 22, 11 a.m.	Remodeling the Seawall boulevard	John M. Murch, County Auditor.
Iowa	Council Bluffs	May 22, 5 p.m.	Paving curbing and guttering various streets	Chas. J. Duff, City Clerk.
Montana	Great Falls	May 22, 8 p.m.	Constructing concrete walks from June 1 to December 31, about 70,000 sq. ft. 5-foot walk, about 10,000 sq. ft. 15-foot walk	W. P. Wren, City Clerk.
New York	New York	May 22, 10:30 a.m.	Paving with asp. block on conc. found., setting curb and furn. 2,500 cu. yds. of paving sand	Cyrus C. Miller, Pres. Bronx Boro.
Iowa	Fort Dodge	May 22, 9 a.m.	Constr. cement conc. pavement and Portland cement curbing on various streets	W. L. Tang, City Clerk.
Wisconsin	Superior	May 22, 1 p.m.	Building standard cement sidw. 5 ft. wide on various streets	P. J. Ekstrand, Chm. Bd. Pub. Wks.
New York	New York	May 23, noon	Repairing and repaving portions of various roadways	Pres. Boro. Richmond.
New York	Auburn	May 23	Constructing subways in portion of Washington street and paving same with vitrified brick	J. S. Hanlon, City Clerk.
Ohio	Bowling Green	May 23, 1 p.m.	Grading, draining and macadamizing county road	F. W. Tean, County Auditor.
Wisconsin	Janesville	May 23, 2 p.m.	Improving portion of Jackson street	John C. Nichols, Chm. St. Ass. Com.
Tennessee	Memphis	May 23	Constr. 175,000 sq. yds. excavation; 70,000 sq. yds. gravel pavement; 48,000 sq. yds. macadam; 10,000 old stone; 25,000 brick; 70,000 sq. yds. asphalt, wood block or bitulithic	J. H. Weatherford, City Engr. Budroe, Sec'y Bd. Pub. Service.
Ohio	Dayton	May 24, noon	Paving 16 streets and 2 alleys	Chas. M. Tobin, Clk. Bd. Control.
Ohio	Marion	May 24, noon	Constr. 1,600 sq. yds. brick pavement; 8,000 sq. ft. sand stone flagging	J. Edw. Schell, Mayor.
Maryland	Frederick	May 24	Constr. 16,000 sq. yds. of pave. and 8,500 lin. ft. of curb	Harry F. Miller, Secy. Bd. C. & S.
New York	Schenectady	May 24, 2:30 p.m.	Repaving various streets and constructing culverts	R. O. Oberlin, County Clerk.
Ohio	Canton	May 24	Paving a mile of road with brick	Maj. H. L. Pettus, U.S.A., Wash.D.C.
Virginia	Culpepper	May 25, 11 a.m.	Repairs to roadway at National Cemetery	J. C. Ely, Dir. Pub. Service.
Ohio	Dayton	May 25	Paving portion of Eleventh st. and two alleys	
Dist. of Col.	Washington	May 25, 2 p.m.	Furn. asphalt paving blocks, repressed vitr. brick; vitr. invert sewer bricks; red sewer bricks; terra cotta sewer pipe; portland cem. and misc. castings for year ending June 30, 1912	Cuno M. Rudolph, Comr. City Clerk.
Ohio	Youngstown	May 26	Grading and paving various streets	John F. Goldenbogen, Clk. Bd. C. C. J.
Ohio	Cleveland	May 27, 11 a.m.	Grad, draining and improving Irish Road No. 2	D. W. Moffitt, County Auditor.
Indiana	Greencastle	May 27, 2 p.m.	Constr. 8,275 lin. ft. macadam road in Russel township	J. F. Goldenbogen, Clk. Co. Comrs.
Ohio	Cleveland	May 27, 11 a.m.	Grading and improving portion of Harvard Road	The George Company, Ran. Bldg. Memphis, Tenn.
Mississippi	Hazlehurst	June 1	Constructing 58 miles of gravel roads in Copiah County	
New Jersey	New Brunswick	June 1	Completing by macadamizing and otherwise improving Franklin Park and Kingston road	Asher Bisset, Clk. Bd. Co. Comrs
New Jersey	Laurel Springs	June 3	Construction concrete sidewalk in Washington Avenue	Sam'l L. Burgess, Township Clerk.
Ohio	Willoughby	June 5, noon	Grading, paving and curbing Euclid St.	C. C. Jenkins, Village Clerk.
New Jersey	Cape May	June 6	Constr. seashore road from Seaville to Beesley's Point	Bd. County Comrs.
Indiana	Wabash	June 6, 1 p.m.	Constr. a gravel road in Chester township	J. P. Nofitzges, County Auditor.
Indiana	Monticello	June 7, noon	Construct. a rock road on County line bet. White & Carrol Cos.	A. G. Fisher, County Auditor.
SEWERAGE				
Ohio	Akron	May 19, noon	Constr. main and lateral sewers in various streets	John W. Gauthier, Dir. Pub. Serv
New Jersey	Garfield	May 19	Installing sewers	Committee on Sewers.
Ohio	Mt. Gilead	May 19	Furn. 8 to 48-in. culvert pipe	Bd. County Comrs.
Massachusetts	Adams	May 20	Constructing sanitary sewers in various streets	Board Selectmen.
New York	Syracuse	May 22	Constr. the Colvin street trunk sewer and several lat. sewers	Geo. J. Metzplause, City Clerk.
Ohio	E. Youngstown	May 22, noon	Constructing sanitary sewer	J. P. Carney, Village Clerk.
Iowa	Council Bluffs	May 22, 5 p.m.	Constructing 600 lin. ft. 8-in. sewer; 900 lin. ft. 6-in. lateral sewer, 800 lin. ft. 10-in., 300 lin. ft. 50 in.	Chas. J. Duff, City Clerk.
Wisconsin	Fond du Lac	May 22, 3 p.m.	Constructing sanitary sewer in various streets	J. F. Hohensee, City Clerk.
Alabama	Birmingham	May 22, noon	Constructing a sewerage disposal plant	L. H. Salter, Sanitary Engineer.
Sask., Can.	Moose Jaw	May 22	Building storm sewer extensions requiring in all 9,000 lin. ft. storm sewer; 11,300 lin. ft. 10, 8 and 6-in. vit. tile pipe	J. M. Wilson, City Engineer.
Oklahoma	Muskogee	May 23	Constr. 21,200 ft. of 48-in. sewer pipe; 6,500 of 45-in. and 7,100 of 42-in. Alternate bids for two ring brick with vitrified invert and manufactured concrete pipe	City Clerk.
Ohio	Amherst	May 23	Constr. a small sewer system and sewage disposal plant	C. G. Aschenbach, City Clerk.
Maryland	Frederick	May 24	Constr. about 4,000 lin. ft. 6-in. to 42-in. sewers with inlets, m.h.	J. Edward Schell, Mayor.
Pennsylvania	Williamsport	May 24	Constructing storm water sewers in various streets	J. J. Galbraith, City Clerk.
New York	Binghamton	May 24	Constructing sanitary sewers in various streets, about \$15,000	Board of Contract and Supply
Ohio	Dayton	May 24, noon	Constructing sanitary and storm sewers in various streets	J. C. Ely, Dir. Pub. Service.
Ohio	Piqua	May 25	Constr. about 4,823 ft. of sanitary sewers with 84 house connec.	T. D. McClay, Dir. Pub. Service.
Ohio	Youngstown	May 26	Constructing sewers in various streets	City Clerk.
Kansas	Leavenworth	May 31, noon	Constructing main storm water drain in the college section	Capt. John S. Winn, Act. Q., U.S.A.
New York	S. Glens Falls	June 1	Constructing a sewer system and disposal plant	C. W. Skym, Village Clerk.

BIDS ASKED FOR

STATE	CITY	RECEIVED UNTIL	NATURE OF WORK	ADDRESS INQUIRIES TO
SEWERAGE (Continued)				
New York	Fort Hamilton	June 2, 11 a.m.	Constructing a sanitary sewer.	Constructing Quartermaster.
Ohio	Bellefontaine	June 2	Constr. reduction tank, primary contact beds, outlet drains, etc.	Dir. Public Service.
New Jersey	Englewood	June 3, 3 p.m.	Constructing a sewage disposal plant complete.	Oliver Drake Smith, Secy. Sew. Com.
Illinois	Ft. Sheridan	June 5, noon	Constr. sewage dis. plant complete, at Fort Sheridan.	Capt. M. E. Saville, Constr. Q.M.
New York	Ossining	June 6, 8 p.m.	Constr. the Kill Brook Trunk Sewer; bulkhead dock and screening chamber at outfall end; also other sewers.	J. M. Terwillinger, Village Clerk.
California	San Jose	July 3	Construct septic tank for County hospital.	City Clerk.
WATER SUPPLY				
Missouri	St. Louis	May 19, noon	Furn. cast-iron-coated water pipe, special castings, stop valves, post fire plugs and post fire plug top parts.	Board Public Improvements.
New York	New York	May 19, 2 p.m.	Furn. and laying water mains in various streets.	Henry S. Thompson, Comr. W. S.
Michigan	Marquette	May 20	Building 2 concrete dams on Dead river and other improvements to the hydroelectric plant. Cost about \$100,000.	Chas. Retaillic, Supt. L. & P. Com
Ohio	Silverton	May 22	Laying a 6-in. water main in portions of several streets.	A. A. Sprague, Village Clerk.
Minnesota	N. Mankato	May 22, 7:30 p.m.	Constructing a water works system. Alternate bids on electric pumping equipment and gasoline. Separate bids on reservoirs, pump house, pumping equipment, water mains and well.	L. Donohue, Village Clerk.
California	San Diego	May 22	Furn. 8,536 lengths of c. i. water pipe from 8 to 36-in.	P. E. Woods, Supt. Water Dept.
Illinois	Stanford	May 22	Constructing water works system.	W. C. Murphy, Village Clerk.
Pennsylvania	Etna	May 22, 5 p.m.	Furn. necessary boilers, smoke connections, boiler foundation, stack and stack foundation for Boro. Water Works.	J. C. Armstrong, Boro. Clerk.
Ohio	Cincinnati	May 22, noon	Constr. two turbine water wheels in the head house of filtration plant.	John J. Wenner, Clk. Bd. Pub. Serv.
Ohio	Youngstown	May 22, noon	Furn. 300 valves from 4 to 36-in. and 108,000 lbs. pig lead.	H. S. Holton, Dir. Pub. Service.
Minnesota	Good Thunder	May 22, 7:30 p.m.	Constr. a water tower and connection pipe.	A. F. Wendlandt, Village Recorder.
Nebraska	Battle Creek	May 22, 8 p.m.	Constr. a water plant, cost \$10,000.	Village Clerk.
Ohio	Barnesville	May 22, noon	Laying water pipe and appurtenances in various streets.	Edwin Wilson, Chm. Bd. Trustees.
Louisiana	Homer	May 22	Furnishing material for water works.	G. G. Gill, Town Clerk.
Ohio	Kenton	May 23	Furn. & install pump, engine, cap, 2,500,000 gal. per 24 hours.	W. P. Steffen, Dir. Pub. Service.
Ontario, Can.	Toronto	May 23, noon	Furn. 3,000 to 3,500 ft. of steel pipe 72-in. in dia. for w. w. intake	G. R. Geary, Mayor.
South Dakota	Vermillion	May 23, 4 p.m.	Constr. a system of water works for the State University.	Fred W. Ford, Secy. Regents Edu.
Wisconsin	La Crosse	May 23, 2 p.m.	Furn. 2,375 pieces c. i. pipe from 6 to 24-in.; 90,725 lbs cast-iron specials, 24 hydrants, valves etc.	Jas. T. Day, Chm. Bd. Pub. Wks.
New York	New York	May 23, 11 a.m.	Completing the Hudson siphon.	Board Water Supply.
Virginia	Ft. Meyer	May 25, 11 a.m.	Constr. about 2 miles of 10-in. water mains.	Capt. Warren W. Whiteside, C. Q.M.
New York	Cortland	May 25, 8 p.m.	Constr. a standpipe or water tank 50 ft. high and having storage capacity of 1,000,000 gals.	Board Water Commissioners.
Ontario, Can.	Harriston	May 25	Excavating and pipe laying for water works system.	City Clerk.
Missouri	Pleasant Hill	May 25	Constructing a water works including 1,500 ft. 8-in.; 10,000 ft. 6-in.; 7,500 ft. 4-in. pipe; lake covering 100 acres; 220 gal. per minute motor driven pumps and 50,000 gal. tank on 50-foot tower.	H. K. Willis, City Clerk.
California	Los Angeles	May 26	Furn. fabricated steel and rivets necessary to con. abt. 1,865 ft. of 9-ft. 3-in. and 8,313 ft. of 11-ft. riveted steel syphon.	Board of Public Works.
Ohio	Toledo	May 26, noon	Furn. rotary pump, 15,000,000 gals. daily; also bituminous coal gas producer and accessories, about 400 h.p. continuous capacity.	Fred Shane, Sec'y Bd. Pub. Service.
Ontario, Can.	Ottawa	May 29, 4 p.m.	Constr. a dam and spillway at Kipewa Village, Pon. Co., Quebec.	R. C. Desrochers, Secy. D.P.W., Ott.
Brit. Col., Can.	Vancouver	May 31, 4 p.m.	Furn. steel pipe, 1 pipe; also 18-in. flexible joint c. i. pipe.	Wm. McQueen, City Clerk.
Wyoming	Ft. Yellowstone	May 31, noon	Constructing pipe line from Panther Creek to Ft. Yellowstone water system.	Constructing Quartermaster.
North Carolina	Concord	May 31, 3 p.m.	Building auxiliary pumping station, furnishing turbine pumps and motors; about 2 miles of 12-in. c. i. pipe; 1,000,000 gal. reinforced concrete sedimentation reservoir; 1,000,000 gal. filter plant.	Chas. B. Wagoner, Chm. Bd. W. & L.C
Missouri	St. Louis	June 2, noon	Furn. detailed drawing, constructing and erecting at Low Service Pumping station two steam, turbine-driven centrifugal pumping units, complete with condensing apparatus.	Board Public Improvements.
Ontario, Can.	Toronto	June 6	Furnishing vertically driven pumps.	C. H. Rust, City Engr.
Indiana	Richmond	June 12, 10 a.m.	Furnishing water to city for period of 25 years.	H. M. Hammond, Chm. Bd. Pub. W.
BRIDGES				
New York	Little Falls	May 19, 9:30 a.m.	Painting four Mohawk bridges.	Matthew A. Leahy, City Clerk.
Ohio	Dayton	May 19, noon	Constr. the substructure, re-erecting the superstructure and rip-rapping the south approach for bridge over Wolf Creek, at its confluence with Great Miami River.	J. C. Ely, Dir. Public Service.
Utah	Moab	May 20	Constructing a bridge over Grand river.	A. A. Neff, County Clerk.
Pennsylvania	Harrisburg	May 20, noon	Constr. new concrete bridge over Paxton Creek.	Board County Commissioners.
Iowa	Sioux City	May 20, 10 a.m.	Constr. a reinforced concrete abutment on the east end of the West 4th. St. Bridge over Perry Creek.	Paul J. Wells, City Clerk.
Ohio	Oberlin	May 22	Constr. superstructure and substruct. of a bridge, at Spring St.	Chas. Chandler, County Clerk.
Pennsylvania	Washington	May 22, 1:30 p.m.	Constructing four reinforced concrete bridges.	John H. Moffitt, Co. Comptroller.
Ohio	Lorain	May 22, 1 p.m.	Constr. substructure and superstructure of four bridges.	Chas. Chandler, Clk. Co. Comrs.
Ohio	Canton	May 22, 10 a.m.	Constr. the William Geckler Bridge No. 80914A, in Pipe twp.	Bd. County Comrs.
Wisconsin	Fond du Lac	May 22, 3 p.m.	Constr. steel & concr. bridge over west branch of de Neveu Creek	J. F. Hohensee, City Clerk.
New Jersey	Paterson	May 24, 2 p.m.	Building a steel and concrete bridge over Wessel Brook	John H. Kehoe, Chm. County Bd.
Mississippi	Jackson	May 27, noon	Bldg. 2 reinforced conc. arch bridges; 1 steel girder bridge.	John J. Pierce, City Engr.
Ohio	Warren	May 29, 1 p.m.	Constr. superstructure of a bridge in Farmington township; 42 ft. roadway, 12-ft. clear.	County Comrs.
Ohio	Norfolk	May 29, 10:30 a.m.	Constr. the sub-structure of the Garret Bridge over Marsh Run	County Commissioners.
Ohio	Cincinnati	May 29, noon	Driving piling for the construction of substructure and miscellaneous work in connection with Gilbert ave. Viaduct.	John J. Wenner, Clk. Bd. Pub. Serv

Kansas City, Mo.—By Park Commissioners, to E. H. Bradbury, to grade 40th st. between Kenwood ave. and Holmes st.

Metuchen, N. J.—Paving Main st., to Liddle & Pfeiffer, Perth Amboy, 68c. per sq. yd.

Newark, N. J.—Paving Concord and Ruyon sts., to Newark Paving Co., \$7,788 and \$7,634; South and Van Buren sts., to Philip & Peter Janmarone, Belleville, \$21,957 and \$3,816.

New Brunswick, N. J.—Resurfacing Livingston ave. with Bermuda asphalt, to Thos. F. Dunigan, Woodbridge, \$1.04 per sq. yd.

South Orange, N. J.—By Township Committee for oiling roads, to Walter S. French Co., of Moorestown.

Albany, N. Y.—To Dollard & Herran for relaying 5,000 ft. curb, 15c.; laying 400 lin. ft. new curb, 70c.; 8 new catch basins, \$50; one moving catch basin, \$50; 10,514 sq. yds. Jamestown brick, \$2.21, city's portion; total cost, \$24,715.94; 3,277 sq. yds., Albany & Southern Railroad's portion, \$2.32.

Brooklyn, N. Y.—Regulating and repaving with grade No. 1 granite on a concrete foundation Bay Ridge ave. from Shore road to 3d ave., to John J. Durkin, 1 Madison ave., New York City, as follows: 11,400 sq. yds. grade 1 granite pavement with ce-

ment joints, 1 year maintenance, \$2.73; 1,900 cu. yds. concrete for pavement foundation, \$1.40; 2,230 lin. ft. new curbs set in concrete, 90c.; 3,350 lin. ft. old curbs reset in concrete, 40c.; total, \$42,829; totals of other bids: M. J. O'Hara, 557 3d st., Brooklyn, \$43,083; Henry J. Mullen, 289 Fulton st., Jamaica, L. I., \$43,883; Richard L. Russell, 186 Remsen st., Brooklyn, \$46,337; MacFarlane Construction Co., 165 9th ave., Brooklyn, \$44,241; John J. Guinan, Gravesend ave. and Neck road, Brooklyn, \$41,442; John F. O'Brien, 740 4th ave., Brooklyn, \$44,788; M. F. Hickey, 6th st. and 2d ave., Brooklyn, \$43,563; Newman & Carey Co., 215 Montague st., Brooklyn, \$44,040; Norton & Gorman Construction Co., 301 Douglas st., Brooklyn, \$46,258; regulating and repaving with asphalt on a concrete foundation (a) of Essex and Linwood sts., (b) Greene ave., to Barber Asphalt Paving Co., (b) \$33,136; to Uvalde Contracting Co., (a) \$17,949; Borough Asphalt Co. bid on (a) \$17,988; regulating and repaving with wood block on concrete foundation Clinton ave. from Park ave. to Willoughby ave., to the U. S. Wood Preserving Co., 29 Broadway, New York City, as follows: 7,445 sq. yds. wood block pavement, 5 years' maintenance, \$2.38; 7,445 sq. yds. present asphalt pavement and foundation to be removed, 32c.; 30 sq. yds. old stone pavement to be relaid, 40c.; 1,140 cu. yds. concrete for pavement foundation, \$5.25; 1,605 lin. ft. new curbs set in concrete, \$1; 1,255 lin. ft. old curbs reset in concrete, 40c.; 12 noiseless covers and heads for sewer manholes, \$12; total, \$28,349; totals of other bidders: Barber Asphalt Paving Co., New York City, \$28.99; Republic Construction Co., 18 Broadway, New York City, \$28,552.

Buffalo, N. Y.—To Constantine Construction Co. for paving Milton st., 28 ft. wide, with round edge shale brick on concrete base, between Seneca st. and the Pennsylvania Railroad, and to German Rock Asphalt and Concrete Co., Ltd., for paving Sanford st., 26 ft. wide, with standard asphalt, between Dewey and Leroy aves.

Depew, N. Y.—Paving Broadway, 2.3 miles in length, with brick, to Edward T. Beck & Co., Warren, Pa., \$53,750.

Lancaster, N. Y.—To Niagara Contracting Co., Corning, for paving with brick principal streets, \$68,800.

New York, N. Y.—Paving with asphalt decks of certain piers of East and Harlem Rivers: Class 1, to Barber Asphalt Paving Co., 30 Church st., \$1.19 per sq. yd.; class 2, to Sicilian Asphalt Paving Co., 41 Park Row, \$1.19 per sq. yd.; class 3, 4, 5 and 6, to Uvalde Asphalt Paving Co., 1 Broadway, \$1.18, 90c., 90c. and 84c., respectively.

Rochester, N. Y.—Laying Medina block stone pavements on Clinton ave. South, Griffith to South Goodman st., to Hageman, Miller & Hageman, \$73,103; from South Goodman st. to city line, to H. N. Cowles, \$43,446.

Seneca Falls, N. Y.—To Patrick D. Conley, Ithaca, for paving State st. and East and West Bayard sts., by Village Board; \$17,000 for macadam paving in West Bayard st., \$27,800 for brick in East Bayard st., and about \$9,300 in State st. for brick.

Utica, N. Y.—Renaving with creosoted wood blocks the viaduct over Ballau Creek at Rutgers st., to Harry W. Roberts & Co., \$5,825, the same to be completed by July 1.

Yonkers, N. Y.—Repairing asphalt streets for one year, to Hearn & Hart.

Fargo, N. D.—To Ira Eddy for laying cement sidewalks for season, \$1.25 per yd.; refilling, 80c. per yd.; to Robert Johnson for laying tile sidewalks, \$1.09 per yd.

Cincinnati, O.—Furnishing crushed stone and screening for the use of the street and sewer repair department, to the Tarco Construction Co., \$24,127.50 for crushed stone and \$5,859.50 for screenings.

Cincinnati, O.—Brick paving on eight alleys, to Evan Evans, \$5,965.50.

Chardon, O.—Grading and paving, to Cement Product Co., Erie, Pa., \$20,385; other bidders: Linniger & Bennet, \$28,337; C. J. Chinnock, \$21,877; Gould & Maybach, \$21,052; Advance Construction Co., \$20,816.

Marion, O.—Constructing Wildcat pipe, 6½ miles long, in Big Island and Montgomery Townships, to J. M. Stone, Marion, \$25,900; other bidders: E. C. Brady, \$27,200; Uncapher & Shaw, \$27,186; P. Drake & Sons, \$29,910; Carrol & Hoyle, \$26,975.

Youngstown, O.—Repairing Market st., between viaduct and Warren ave., to Jas. McCarron, \$27,609; grading main entrance to Lincoln Park, to Kennedy Bros., \$1,900.

Portland, Ore.—Paving East Morrison st. with wood block, to Carbolineum Wood Preserving Co., \$18,655; Commercial st., to Consolidated Contract Co., J. N. Johnson, President, \$26,610.

Salem, Ore.—Paving with bitulithic Liberty st., to Warren Construction Co., Oregonian Bldg., \$1.85 per sq. yd.

Ashland, Pa.—Grading and paving with vit. brick Centre st., approximately 7,000 sq. yds., to Coryell Construction Co., of Williamsport.

Bradford, Pa.—Paving Webster st., 2,623 sq. yds., with brick, to M. Applegate & Son, \$2.06 per sq. yd.; 787 cu. yds. excavation, 55c.; cement sidewalks, to J. Sheehan.

Erie, Pa.—Building concrete top for Mill st. culvert, to O. S. Riblet, \$925 for work complete.

Scranton, Pa.—Furnishing stone crusher and bin, to Good Roads Machinery Co., \$1,159.

Pascoag, R. I.—Paving Main st. with granite blocks, to Fred L. Mathewson, Harrisville, \$2.25 sq. yd.

Austin, Tex.—Paving, as follows: To Dallas Bitulithic Co., for 37,778 sq. yds. bitulithic at \$2.278 per sq. yd., total \$86,058, and to Knox Johnson for 7,933 sq. yds. wood blocks, \$2.325 per sq. yd., or total of \$18,144.

Portsmouth, Va.—Street work in Sixth Ward: Grading Glasgow st., Scott's Creek to city limits, to E. P. Lindsay, \$2,431; curbing same thoroughfare, to F. J. McGuire, \$2,987; paving Glasgow st. with 4½-in. concrete base, 2½-in. macadam top with tarvia binder, to F. J. McGuire, \$6,760.20; total cost of paving will be \$12,178.20; grading County st., Chestnut to Rose st., to E. P. Lindsay, \$4,207; Pearl st., County to South st., to E. P. Lindsay, \$1,039; placing granite curb in County st., Chestnut st. to Rose st., F. J. McGuire, \$5,800; paving County st., Chestnut to Rose, 4-in. concrete base with 2½-in. macadam top, with tarvia binder, to F. J. McGuire, \$22,104.60; the Air Line turnpike from Rose st. to the city limits, with macadam, to F. J. McGuire, \$2,679; bring the rails of the Traction Company on County st. up to grade, to F. J. McGuire, \$2,500.

Milwaukee, Wis.—Furnishing 16,500 cu. yds. of crushed stone, to Wisconsin Stone Co., \$1.23 for west side and 9,000 cu. yds. for south side, \$1.25.

Green River, Wyo.—By city, to Geo. Durnford, of Evanston, for construction of 18 blocks of cement sidewalk and 20 street crossings.

BIDS RECEIVED

Indianapolis, Ind.—Paving Locke st., Walnut st. to Indiana ave., American Construction Co., brick, \$2.33 per lin. ft. on each side and street and alley intersections, \$1.150; Marion County Construction Co., asphalt or bitu mineral, \$3.30 per lin. ft. for each side and street and alley intersections, \$1,120.

Saginaw, Mich.—Paving with asphalt, W. N. Sager, \$1.49½; Quinlan Asphalt Co., Syracuse, N. Y., \$1.64; Cleveland Trinidad Co., \$1.58, and Carpenter & Anderson, Grand Rapids, \$1.50; brick, Z. & J. La Londe, Saginaw, and E. W. Reed, Detroit, \$1.42 each, and A. Gelinas & Sons, \$1.44; Saginaw material was named in all brick proposals: fifteen streets are to be paved.

Atlantic City, N. J.—Paving Vermont and other avenues, W. R. Keith, brick gutter, \$2.52; bituminous, \$2.66; bituminous old fill, \$2; gutter, \$2; rock, ton, \$2.50; curb, 70c.; United Paving Co., brick gutter, \$2.57; bituminous, \$2.62; bituminous old fill, \$1.95; gutter, \$2; rock, ton, \$2.56; curb, 68c.; Standard, New York, brick gutter, \$2.62; bituminous, \$2.68; bituminous old fill, \$2.02; gutter, \$2.05; rock, ton, \$2.45; curb, 74c.; paving Congress ave., Calloway pl. and Euclid ave., United Paving Co., gutter, \$2.57; bituminous, \$2.62; curb, 68c.; W. R. Keith, Rockford, Mass., gutter, \$2.52; bituminous, \$2.66; curb, 70c.; Standard, gutter, \$2.62; bituminous, \$2.68; curb, 74c.

Fulton, Mo.—Paving with macadam with binder, Jos. Pope, Jefferson City, lowest bidder, West 7th st., excavation, 30c.; curbing, 33c.; macadam, 63c. and parking, 5c.; East 5th st., 30c., 33c., 82c. and 3c.; totals, \$4,587.25 and \$8,287.87; Engineer's estimate, \$4,837.81 and \$9,481.85; other bidders: Johnson & Hyatt, \$4,710.20 and \$8,734.11; Geo. W. Barkwell, \$4,621.87 and \$9,009.23; O. T. Dunlap, \$5,963.88 and \$10,567.96.

Newark, N. J.—Resurfacing number of roads with stone, supplying of broken stone for others and the use of amesite for resurfacing; Springfield ave., Stuyvesant ave. to Rahway River, 10,000 ft., Millburn Trap Rock Co., 18c. per sq. yd.; Northfield road, on easterly slope of First Mountain, 2,000 ft., Daniel J. O'Rourke, 35c.; Mt. Pleasant ave., Prospect ave. to Rahway River, 2,500 ft., Donato Fusco, 37c.; Little Falls road, Montclair, 2,000 ft., Robert Doriety, 31½c.; Mt. Hebron road, Montclair, 2,000 ft., Robert Doriety, 38½c.; Grove st., Montclair, 8,000 ft., Osborn & Marcellus, 32c.; Sanford ave., Irvington, 6,000 ft., R. H. Kernan and Ludwig Bolt, tied, 35c.; Stuyvesant ave., Irvington, 10,000 ft., R. H. Kernan, 38c.; Grove st., East Orange, 2,500 ft., Eagle Rock ave., different sections, 5,500 ft., P. A. Matthews, 30c.; Ridge road, south end, 3,000 ft., P. A. Matthews, 30c.; Pompton turnpike, Bloomfield ave. N., 3,000 ft., F. H. Marley, 24c.; South Orange ave., Centre st. W., 2,000 ft., R. H. Kernan, 29½c.

Geneva, O.—Paving Main St. (A) E. A. Freshwater & Sons, awarded contract, for Century block, \$46,437; (B) Ohio Engineering Co.; (C) The Buckeye Engineering Co.; (D) The Enterprise Paving & Construction Co.; (E) H. N. O'Berlander; (F) Wilson & Harper; (G) Geo. M. Harris; (H) Downs & Campbell; (J) J. J. & K. W. Burns; (K) Gould & Mayback; (L) Baldwin Bros.; (M) Wm. E. McHugh; (N) Hewitt Construction Co.

Table with 13 columns (A-N) and multiple rows of construction items and their corresponding costs. Items include grading, foundation, block paving, curbs, sewers, manholes, and sheet piling.

Paving Broadway, to same, for century block, \$34,823; bids for material were practically same as above.—Cummings & Downer, Painesville, Engineers.

Philadelphia, Pa.—Asphalt repairs to traction streets, Filbert Paving and Construction Co. bid 63c. per sq. yd. and the Barber Asphalt Co. 54c.; granite block along rails and between rails, Filbert Co. 15c., and the Barber, 20c. per yd.

Vancouver, B. C., Can.—Grading 12th ave., Granville to Hemlock, A. R. Gibson, \$6,975; M. P. Cotton, \$8,287.50; H. V. Tucker, \$6,630; R. J. Preston, \$8,287.50; Cleland & McLeod, \$8,840; LaPlace Bros., \$6,398; tenders for grading, grade 13th ave., Spruce to Birch, Cleland & McLeod, \$5,149.90; A. R. Gibson, \$5,500; D. Matheson, \$5,149.90; LaPlace Bros., \$5,989.20; 11th ave., Spruce to Aider, Cleland & McLeod, \$4,100; A. R. Gibson, \$3,950; LaPlace Bros., \$4,359; 12th ave., Spruce to Aider, Cleland & McLeod, \$4,131; D. Matheson, \$4,712; A. R. Gibson, \$4,050; LaPlace Bros., \$4,608; 12th ave., Main to Sophia, Cleland & McLeod, \$2,600; LaPlace Bros., \$2,841; bitulithic paving on 12th ave., two sections, Columbia Bitulithic Co., from Bridge to Columbia, \$14,300; from Columbia to Main, \$20,891.34.

SEWERAGE

Oxford, Ala.—Election on \$12,000 bonds for sewerage improvements has been postponed until May 29.

Pollard, Ala.—City has decided to construct sewer system.

Orland, Cal.—Citizens have voted \$25,000 bonds for sewer system.

St. Petersburg, Fla.—Citizens will vote June 13 on \$5,000 bonds for sewers.

Collegepark, Ga.—City has engaged Doak & McKechnie, of Greenville, S. C., as Engineers in charge of installation of sewerage and water works.

Unadilla, Ga.—City is considering installation of sewers; Engineer C. F. Wagner, representing J. B. McCrary Co., Atlanta, will run town line of streets and prepare map.

Brazil, Ind.—Plans have been prepared for sewer work including 20,000 ft. of concrete sewer and 3,000 ft. of sewer pipe.—Frank Kattman, City Engineer.

Fairfield, Ia.—Hall & Adams, Centerville, have been selected as engineers to prepare plans for installation of complete sanitary sewer.

Reed City, Mich.—Council has passed resolution directing the President to engage engineer to prepare plans for sewer system and rehabilitation of water works.

Proctor, Minn.—Bond issue for construction of sewers is being considered.

Billings, Mont.—Council is considering resolution for forming of sewer district in North Elevation subdivision; system will include 9,000 lin. ft., 8- and 10-in. pipe, 26

manholes, seven flush tanks and 6,556 cu. yds. of excavation; total cost, \$12,497.

Ocean City, N. J.—Citizens have defeated \$75,000 bond issue for storm water drainage.

Seaside Park, N. J.—Borough Council is considering \$35,000 expenditure on sewer, water and light plant.

Roswell, N. M.—Council has authorized building of \$3,400 ft. of sewer to extend system into Lea subdivision.

Carey, O.—Riggs & Sherman, of Toledo, have been selected to prepare plans and specifications for sewer and sewage disposal plant.

Girard, O.—Council has adopted set of storm sewer plans as prepared by City Engineer Wm. Wilson; cost \$8,000.

Hilliard, O.—Citizens voted \$8,000 bonds for sewer system.

Bristol, Pa.—Changes will be made in proposed sewage disposal plant on suggestions by Dr. Dixon; sterilization plant will be installed instead of sand filters as originally proposed, while Imhoff digesters will be installed instead of septic tanks, and sprinkling filters instead of concrete beds; site of plant will be changed to higher ground, and to a point 500 ft. nearer Pennsylvania Railroad tracks.

Sharon, Pa.—Trimble & Miller, of Pittsburgh, are preparing plans for sewage disposal plant.

Zellienople, Pa.—Town is planning additional sewerage.

Pawtucket, R. I.—Joint resolution has been passed by Board of Aldermen appropriating \$1,350 for sewer in Rhode Island ave.

Woonsocket, R. I.—Board of Aldermen has passed ordinance for construction of sewers in Harrison ave. and Glen road.

Bastrop, Tex.—Sewerage system will be at once installed in Main st.; later will be extended over all parts of city.

Itasca, Tex.—Citizens have voted to install sewerage system.

Slaton, Tex.—City is considering installation of sewerage system.—J. S. Edwards, Mayor.

Ronceverte, W. Va.—Citizens will vote on \$5,000 bonds for extension of sewer and water systems.

Milwaukee, Wis.—Special Sewerage Commission, J. W. Alford, Chairman, has recommended entire rearrangement of city's sewerage system by erecting miles of main intercepting sewers along river front at cost of \$2,213,000; purification plants on shore of Kinnickinnic River, \$933,000, and on lake shore, \$2,668,000; flushing tunnel for Menominee River, \$1,162,000; sewage pumping plant, \$669,000; low level interceptors, \$4,110,000, and installation of complete filtration plant, \$1,500,000.

Green River, Wyo.—Surveys and estimates have been made for 2,500 ft. of 8-in. sewer with 8 manholes, which will be an extension to present city sewer system. Turpin & Eldridge, Civil Engineers, of Itawamba, are Engineers for this work.

Camrose, Alta., Can.—Ratepayers have voted \$83,000 for construction of sewerage and water works systems.

CONTRACTS AWARDED

Bement, Ill.—To Arthur Birt, Decatur, by the Board of Local Improvements, for the furnishing of material and construction of system of storm sewers and also an out-flow drain.

Galva, Ill.—Building sewer, to R. C. Richter, of Manitowoc, Wis., \$15,702.

Gibson City, Ill.—To Frank Sullivan, Bloomington, by Town Board, for sewer work, \$2,500.

Peoria, Ill.—To Ottawa Construction Co., Ottawa, for construction of the Swinnerton st. sewer.

Kokomo, Ind.—Building intercepting sewer, to Michaels-Minnick Co., Marion, \$47,041.45; only other bidder, Reliable Construction Co., Indianapolis, \$47,700.

Kokomo, Ind.—Construction of sewers, to Michael & Murnick, Marion, \$47,041.11; other bidder, Reliable Construction Co., Indianapolis, \$47,700.

Cloquet, Minn.—Extending sewer and water system, to Pastoret-Lawrence Co., Duluth, \$23,398.43.

Duluth, Minn.—Laying storm sewer in 6th ave. West, to P. McDonnell, \$12,761.10.

Deming, N. M.—Constructing a sanitary sewer system, to G. Jaeger, of Rich Hill, Mo., \$34,940; contract calls for 38,600 ft. sewer, 80 standard manholes, 5 flush tanks, one double compartment septic tank, etc.—W. B. Bullock, Kansas City, Mo., Engineer.

Utica, N. Y.—Construction of a sewer in Warren ave., Holland ave. to Genesee st., to Jeremiah Augar, \$2,065.50.

Fargo, N. D.—To Gilbert W. Haggert for building sewers on 9th st., \$1.24 per lin. ft.; \$50 for manholes and \$50 for catch basins; on 10th st., to same, \$1 per ft., \$50 for manholes and \$50 for catch basins.

Hubbard, O.—Construction of a sewer system and disposal plant, to Harry Baxter, Lorain, \$23,269.65.

Doylestown, Pa.—Reconstructing sewage disposal beds, to Julian M. Solomon, Jr., 30 N. 7th st., Philadelphia.—Wm. Bishop, Superintendent.

Erie, Pa.—Building 9-in. sewer in East 14th st., to F. J. Eichenlaub, \$4.50 per ft. for pipe and \$150 for manholes.

Kenosha, Wis.—To White Construction Co. for building main sewer of concrete, \$97,200.

BIDS RECEIVED

Washington, D. C.—Bids were received as follows on May 1 by District Commissioners for construction of sewers in Cleveland Park: George Hyman, excavation, \$2,40; sewer brick masonry, \$14; 10-in. sewer, 55c.; Warren F. Brenizer Co., excavation, \$1,40; sewer brick masonry, \$14; 10-in. sewer, 70c.

Butler, Pa.—Sewer on Miller st., W. J. Eury, 6-in. sewer, 38c.; 8-in. sewer, 43c.; N. J. Boyer, 8-in., 40c.; 6-in., 35c.; 4-in., 33c.; flush tanks, \$65; "Y" branches, 30c.; F. E. McQuiston, 6-in., 44c.; 8-in., 47c.; manholes, \$25; flush tanks, \$60; laterals, 35c.; "Y" branches, 35c.; Tony Morelli, 4-in., 34c.; 8-in., 44c.; flush tanks, \$65.25; "Y" branches, 65c.; manholes, \$35.50; section of sewer on 4th st., J. E. Huselton, 8-in., 55c., 4-in., 45c., "Y" branches, 35c. extra; W. J. Eury, 45c.; "Y" branches, 44c.; laterals, 35c.; N. J. Boyer, 8-in., 60c.; 6-in., 35c.; "Y" branches, 35c.; H. A. McNamee, 8-in., 75c.; 4-in., 60c.; "Y" branches, 50c.; Tony Morelli, 8-in., 48c.; 4-in., 35c.; "Y" branches, 75c.

WATER SUPPLY

Booneville, Ala.—Booneville Oil and Gas Co. is considering construction of water works and gas plant; has applied for franchise.

Pollard, Ala.—City will construct water works and sewer system, including pipe 6 ins. in diameter to depth of 800 to 1,000 ft., where it is expected to secure flow of water which will rise to height of 60 ft. from ground; water will flow into tank of about 35,000 gals. capacity.

Doris, Cal.—City has sold \$12,500 water bonds to G. G. Blymer & Co., San Francisco.

Orland, Cal.—Citizens have voted \$25,000 bonds for water works system.

Milton, Del.—Council has commissioned George E. A. Fairley, Baltimore, to make plans for water system of artesian wells and standpipe.

Washington, D. C.—American Consul in an European country reports that Mayor of a city in his district has applied for information regarding pumps run by electricity; the Mayor desires to install in the city wells pumps of this character, and wishes to be put in touch with manufacturers. Address No. 6686, Bureau of Manufacturers.

St. Petersburg, Fla.—Citizens will vote June 13 on \$5,000 bonds for extension of water works.

Collegepark, Ga.—City has engaged Doak & McKechnie, Greenville, S. C., as Engineers in charge of installation of water works and sewerage.

Tallapoosa, Ga.—Citizens will vote on \$25,000 water works bonds to purchase water works system now in operation, and improving same by installing filtering system and adding other improvements.

Idaho, Ida.—Council is considering installation of water works.

Hammond, Ind.—W. F. Brunt, 25 Marion st., will purchase power-driven diaphragm pump.

Richmond, Ind.—Board of Works has advertised for bids for supplying water to citizens of Richmond from five to twenty-five years.

South Bend, Ind.—Complete rehabilitation of the city water works system at expense of approximately \$335,500 has been recommended by Clinton S. Burns, of Burns & McDonnell, Hydraulic Engineers, Kansas City, Mo.; work includes pumping station in the northwest section of city, the cost of which will be \$25,000; auxiliary station in Leeper Park, costing \$7,200; water tower in the south end, \$18,700; new lines and extensions, \$110,000; 5,000,000-gal. reservoir, \$43,500; new wells, \$20,000, and 8,000,000-gal. capacity engine, \$30,000.

Blockton, Ia.—Citizens will vote on installation of \$15,000 water system.

Fairfield, Ia.—Hall & Adams, Centerville, have been selected as engineers to prepare plans for improvements to water works plant, including filtration plant.

Shelbyville, Ky.—Charles E. Collins, Consulting Engineer, Drexel Bldg., Philadelphia, is preparing plans for concrete dam for Shelbyville Water and Light Co.

Kentwood, La.—Town is being surveyed for location of water works and electric light system.

North Haven, Me.—City proposes to construct water works.—J. O. Brown, Town Clerk.

Lynn, Mass.—Council has authorized \$75,000 bond issue to cover cost of installing pump at Montrose, pump at the easterly end of Glen Lewis Pond, laying of pipe line from the proposed Glen Lewis pumping station to Breed's Pond, and preparation of plans for raising of Breed's Pond Dam to a height of 51 ft.

Worthington, Mass.—Water Commissioners of Worthington Fire District have engaged E. E. Davis, Northampton, civil engineer, to make necessary surveys and estimates for water supply.

Oswosso, Mich.—Superintendent of Public Works has recommended improvements to water works.

Eveleth, Minn.—Installation of new and enlarged water main is being considered.

Ossipee, N. H.—Dudley & Sawyer, Manchester, are preparing plans for water works for the Ossipee Water Co. to supply village of Moultonville, Mountainview and Center Ossipee with water by gravity from Dam Hole Pond.—Col. L. A. Merow, President.

Seaside Park, N. J.—Borough Council is considering \$35,000 expenditure on water, sewer and light plant.

Bloomingsdale, N. Y.—Village has sold \$15,000 water bonds and will at once install system.

Fredonia, N. Y.—Board of Trustees has decided to engage Frederick K. Wing, of Buffalo, to look over situation in regard to proposed improvements at the water works and pass on feasibility of plans that already have been drawn; plans call for expenditure of \$16,000.

Granville, N. Y.—Charles E. Collins, Consulting Engineer, Drexel Bldg., Philadelphia, Pa., is preparing plans for improvements to water works, including concrete reservoir, filtration plant, a pumping station of about 2,000 gals. per minute capacity and about two miles of 12-in. c.-i. mains.

Lyons, N. Y.—Citizens have defeated \$4,000 appropriation for pure water supply.

Newport, N. Y.—Morrell Vrooman, of Gloversville, is preparing plans for proposed water distribution system.

New York, N. Y.—Board of Estimate has approved plan of Commissioner Thompson for completion of easterly basin of Jerome Park reservoir, and construction of sand filtration plant for purification of the water from Croton watershed; \$8,690,000 corporate stock will be issued to carry out the proposed improvements.

Morgantown, N. C.—Citizens have voted \$35,000 bond issue for water works.

Zanesville, O.—Johnson & Fuller, 150 Nassau st., New York, N. Y., have been selected as engineers to design system of water works.

Hermiston, Ore.—John T. Whistler has been engaged by Council to make a survey of city and report on the most feasible plan for water system.

Franklin, Pa.—City will expend about \$23,000 for improvements to include pump, boiler, etc.—Phil. Heid, Superintendent Water Works.

Junlata, Pa.—H. C. Linton, Altoona, is preparing plans for water works; cost \$25,000.—W. H. Baird, Borough Clerk.

Montrose, Pa.—Council is considering resolution that committee be appointed to in-

Easton, Md.—Building sewer and sewage disposal plant, bids received Apr. 15: (A) Heins & Hayman, successful bidders, \$37,011.78; (B) United Paving Co., Atlantic City, \$39,117.06; (C) Coryell Construction Co., Williamsport, Pa., \$40,239.15; (D) B. F. Sweeten & Son, Camden, N. J., \$40,262.76; (E) D. M. Andrew & Co., \$40,733.04; (F) Hard & Worm, New York, \$41,285.77; (G) J. B. O'Rourke (K) Kingdon Construction Co., Baltimore, \$46,353.05; (L) Wm. C. Evans, Ambler, Pa., \$51,867.17; Clyde Potts, 30 Church St., New York City, Engineer.

investigate ways and means of installing water plant to be operated by borough.

West Chester, Pa.—Council has decided to install larger water mains.

Arlington, Tenn.—City is considering installation of water plant; cost \$6,000.

Terrell, Tex.—Commission has ordered purchase of 22,200 ft. of new 8-in. water main to be installed on North Rockwall ave.

Camrose, Alta., Can.—Ratepayers have voted \$83,000 for construction of water works and sewerage systems.

London, Ont., Can.—Tenders will soon be asked for three or four deep wells with 8-in. casing, about 12,700 ft. of 4-in., 6-in. and 8-in. c.-i. water pipe, about 35 hydrants and 8 tons of special castings, also 1 steel elevated tank, 125 ft. high, capacity 40,000 or 50,000 gals; pumping equipment not decided upon until wells are driven; two half million gal. pumps or greater, also deep well pumps or air lift will be installed.—F. W. Farncomb, Chief Engineer.

Prince Rupert, B. C., Can.—Plans have been prepared for Council by Col. W. H. M. Davis for a permanent water supply for city; estimated cost of \$330,000 for supply main, \$480,000 for whole work.

South Vancouver, B. C., Can.—City will soon receive bids for 42 miles of 4-in. and 8 miles of 6-in. steel pipe; furnishing 45,000 ft. of ½-in. and 20,000 ft. of ¾-in. g.-i. pipe; 4,400 brass cocks, 300 fire hydrants and special castings and pig lead.

Tavistock, Ont., Can.—F. W. Farncombe, London, has prepared plans for water works; cost about \$22,000.

CONTRACTS AWARDED

Corning, Cal.—Construction of water system, to Braun, Williams & Russell Co., \$40,500.

Alamosa, Col.—Constructing water works, to Marshall Bros., Las Animas, \$74,000.

Dolores, Col.—To Engineer Geo. H. Sethman, Denver, for constructing water works, about \$40,000.

Washington, D. C.—Furnishing 90 tons of c.-i. water pipe and specials, to Standard Cast Iron Pipe and Foundry Co., Bristol, Pa., \$51.50 per gross ton, and 2,411 tons c.-i. water pipe, to U. S. Cast Iron Pipe and Foundry Co., 71 Broadway, New York, at \$22.84 per gross ton; furnishing corporation and curb cocks, 4,000 ¾-in. corporation cocks, to the Glauber Brass Mfg. Co., Cleveland, O., at 56.5c. each; 200 1½-in. corporation cocks, to A. P. Smith Mfg. Co., of East Orange, N. J., \$1.96 each; 250 ¾-in. lead flanged corporation cocks and 4,250 ¾-in. lead flanged curb cocks, for lead and pipe only, to Hays Mfg. Co., of Erie, Pa., 58.5c. and 63c., respectively.

Chicago, Ill.—Furnishing and installing sluice gates in the Southwest Land tunnel, to Coffin Valve Co., Neponset, Boston, Mass., \$7,000.

Orangeville, Ill.—Building water tank, to U. S. Wind and Pump Co., Batavia.

Whiting, Ind.—Construction of 14-in. water mains in 121st st., Indian blvd. and Clark st., to W. H. Brunt, \$9,664; other bidders: Neyd & Greenwald, \$10,055; T. H. Iglehart, \$10,525.

Arkansas City, Kan.—To Layne & Fowler Co., Houston, Tex., to furnishing city with water, \$13,500, city to furnish pipe, erect settling basin and convey water to pumping station at cost of \$14,000; work to begin at once.

Hoisington, Kan.—To Bash & Gray, Joplin, Mo., for constructing water system.—Rollins & Westover, Beals Bldg., Kansas City, Mo., Engineers.

White Castle, La.—Laying 2,000 ft. of water mains on lower Bowle st., to David Lopez; material will be furnished by Woodward, Wight & Co., Ltd., New Orleans.

Fort McKinley, Me.—Installation of chemical water softening plant, to the L. M. Booth Co., 116 Liberty st., New York, for plant complete, except item 4, at \$6,320; to F. H. Marshall, item 4.

Longmeadow, Mass.—By Water Commissioners for construction of concrete reservoir and foundation of pump house at the water works, to Vaughn & Kibbe, Springfield.

Cloquet, Minn.—Extending water and sewer system, to Pastoret-Lawrence Co., Duluth, \$23,398.43.

Kansas City, Mo.—Furnishing about 1,622 tons of c.-i. pipe and 3 5 tons of special castings, to U. S. C. I. Pipe and Foundry Co., city; pipe, all sizes, \$26.70 per net ton; castings, \$65 per ton.

Morehead, N. C.—To the Harris Hardware Co., Washington, N. C., to construct water works; cost about \$20,000.

Fargo, N. D.—To James Kennedy for the construction of filtration plant, \$98,968, for furnishing pumping engine \$11,860, and the boilers and stokers, \$8,062.

Cincinnati, O.—By Service Director Sundmaker for laying water mains in Lick Run road and other Westwood streets, to J. J. Brown, \$6,429.50.

Oklahoma City, Okla.—Building sedimentation basin at water works, to Hunter & Hunter, city, \$12,987.60.

Erie, Pa.—Laying 400 pieces of 6-in. pipe to be used in extension of water mains by Water Commissioners, to the United States Cast Iron Pipe Co., Chicago, \$21.75 per ton delivered in Erie; other bids were as follows: American Casting and Foundry Co., Detroit, \$24.85; Standard Cast Iron Pipe and Foundry Co., Bristol, Pa., \$22.50; Massillon Iron and Steel Co., \$24.15.

Zelienople, Pa.—To Martin Swain, city, for the construction of reservoirs and an 8-in. rising main, \$8,500.—Douglass & McKnight, 1709 Union Bank Bldg., Pittsburg, Engineers.

Galveston, Tex.—Adding 40 ft. to Alto Loma standpipe, to J. J. Kane, \$1,052.

Park City, Utah.—Building water system, to A. A. Clark, Salt Lake City, \$47,245.15.

Gleichen, Alta., Can.—Water works and sewers: Contract A, drilling deep well, to Alberta Well Drilling Co., Calgary; B, supply of lap-welded steel pipe, to General Supplies, Ltd., Calgary, for Stewarts & Lloyds; C, gate valves, to Canadian Fairbanks Co., for Alley & McLellan's valves; D, hydrants, to Calgary Ironworks Co., Calgary; E, elevated steel tank, to Des Moines Bridge and Iron Co., Des Moines, Ia.; F, sewer pipe, to Red Wing Sewer Pipe Co., Red Wing, Minn.; G, manhole covers, etc., to London Foundry Co., London, Ont.; work will be done by John Galt Engineering Co., of Winnipeg and Calgary.

Harrison, Ont., Can.—Supplies for water works: Cast iron pipes and special casting, to Gartshore Tomson Pipe and Foundry Co., Ltd., Hamilton, \$31.20 per ton for c.-i. pipe and \$2.75 per 100 lbs. for special casting, to James Robertson Co., Ltd., for lead \$3.06 per 100 lbs. and \$14.50 per 100 lbs. for gasket; building water tower, to Hunter Bridge and Boiler Co., Kincardine, \$2,505; to Ker Engine Co., Walkerville,

\$30 each for hydrants, and \$2.50 for 10-in. valves, \$15 for 8-in. valves, \$9 for 6-in. and \$5.60 for 4-in. valves.

Welland, Ont., Can.—Furnishing pump and water wheel for the new water works pumping station, to Canadian Boving Co., Toronto; contract calls for a 3,300,000 horizontal triplex single acting pump developing 250-hp. on a 7-ft. head, \$11,900; traveling crane, \$400; pump and wheel are slow speed machines; other bidders: John McDougal Co., Montreal, pump and turbine, \$14,069; John T. Farmer, Montreal, pump and turbine, \$15,250; Goulds Pump Co., Montreal, pump and turbine, \$15,250; Smart Turner Machine Co., Hamilton, pump and turbine, \$18,500; Wm. Hamilton Mfg. Co., Peterboro, pump and turbine, \$14,600; Escher Wvys & Co., Toronto, pump and turbine, \$14,365; the Canada Foundry Co. and John Inglis Co. tendered for pump only.

BIDS RECEIVED

Fort McKinley, Me.—Construction and installation of a chemical water softening plant of 15,000 gals. capacity; L. M. Booth Co., 116 Liberty st., New York, complete, \$6,870; Item (1) \$4,800, (2) \$550, (3) \$970, (4) \$550; the Kennicott Co., Chicago Heights, Ill., Item (1) \$5,500; American Water Softener Co., 1011 Chestnut st., Philadelphia, Pa., complete, \$7,300; Item (1) \$4,950; Northern Water Softener Co., Madison, Wis., Item (1) \$4,400, (2) \$750, (3) \$1,300; William Graver Tank Works, Rookery Bldg., Chicago, Item (1) \$3,150 and \$3,980, (2) \$1,260, (3) \$2,065; Reisert Automatic Water Purifying Co., 30 Church St., New York, Item (1) \$3,475, (2) \$285, (3) \$485, (4) and (3) 1,064; Gem City Boiler Co., Dayton, O., Item (1) \$5,570, (2) \$1,770, (3) \$3,645, (4) \$850; Pittsburg Filter Mfg. Co., Pittsburg, Pa., Item (1) \$6,475, (2) \$675 and \$375, (3) \$2,225; Frank H. Marshall, South Portland, Me., Item (4) \$439; Felber Engineering Works, Inc., New York, complete, \$6,750, not complying with specifications, Item (4) not included in price.

Rahway, N. J.—Installing 5,000,000-gal. pump at water works: Wilson-Snyder Co., Pittsburg, Pa., \$21,000; Allis-Chalmers Co., New York, \$13,950; Heisler Co., St. Mary's O., \$16,195; Cockburn Co., Jersey City, \$19,220; Alternate bids, \$16,300, and \$21,500; Platt Iron Works Co., Dayton, O., \$17,900; Epping-Carpenter Co., Pittsburg, Pa., \$14,600, and three alternate bids, \$13,200, \$13,100 and \$12,700; Snow Steam Pump Co., Buffalo, \$14,335.

Buffalo, N. Y.—Building two tunnels from east side of old pumping station and carried under the New York Central tracks, with extensions to west curb of Front ave.; they are to be of brick and are for discharge mains and new pumps Nos. 3 and 4; Eastern Concrete Steel Co., \$22,462; William Franklin, \$25,860; B. I. Crooker Co., \$26,981; George W. Moore, \$27,900; Joseph F. Stabell Co., \$29,500; Dark & Co., \$29,600; the Commissioner certified the Eastern as the low bidder.

Fargo, N. D.—Construction of filtration plant: F. T. Powers & Co., Fargo, \$109,300; James Kennedy, Fargo, \$98,970; Pittsburg Filter Co., \$115,700; Fargo Plumbing and Heating Co., \$130,507; S. Birch & Sons Co., Fargo, \$118,000; furnishing the pumping engines, the Fargo Plumbing and Heating Co. had four different bids, for different types of engines as follows: No. 2, \$22,325; No. 3, \$22,447; No. 4, \$21,393; No. 5, \$23,922; Platt Iron Co., of Kansas City, Mo., one bid for

\$12,650, and same company offered another for vertical expansion engines for \$23,000, the former bid being on horizontal type of engines; the Eppington-Carpington Co., horizontal engine for \$12,700; James Kennedy, Canton-Hughes with four bearings, \$12,300 and \$11,860, latter having two bearings; the Murray Iron Works Co., of Minneapolis, horizontal engine for \$14,48; Allis-Chalmers Co., Milwaukee, offered vertical engine for \$28,000 and one of horizontal type for \$12,625; specifications call for pumping engines with a capacity of 4,000,000 gals. every 24 hours; boilers and stokers, the Robinson, Cary & Sands Co., of St. Paul, three Edgemore horizontal boilers with stokers, \$10,460; Detroit Auto Stoker Co., three boilers and stokers, \$8,450; James Kennedy, for the same, \$8,062; R. B. Whitaker, for the same, \$9,965; Minneapolis Steel and Machine Co., for the same, \$7,547; the \$130,507 bid of Fargo Plumbing and Heating Co. was for complete filtration plant and equipment; specifications call for boilers tested to 150 for continuous use.

Niles, O.—Construction of the Water Filtration plant and clear well; Ensminger Bros., of Columbus, lowest bidders: Purification plant, (a) material, \$20,000, (b) labor, \$12,900; clear well, (c) material, \$4,000 (d) labor, \$2,920; total, \$30,820; other bidders: W. H. Ralston, Mt. Vernon, purification plant (a) \$20,000, (b) \$19,000, (c) \$3,300, (d) \$3,000; total \$45,300; Roberts Filter Mfg. Co., Philadelphia, Pa., (a) \$20,000, (b) \$22,100, (c) \$4,000, (d) \$3,000; total, \$49,100; Pittsburg Filter Mfg. Co., Pittsburg, (a) \$17,200, (b) \$25,000, (c) \$3,600, (d) \$3,000; total, \$48,800; Niles Lumber Co., Niles, (a) \$28,000, (b) \$12,000, (c) \$4,500, (d) \$3,500; total, \$42,950; American Water Softener Co., Philadelphia, (a) \$28,224, (b) \$18,815, (c) \$4,048; (d) \$2,700; total, \$53,787; Louis Adavasio, Youngstown, (a) \$26,000, (b) \$20,000, (c) \$4,000, (d) \$3,000; total, \$44,501.

Springfield, O.—Laying a force main from the old to new pumping station, Patrick Caffery, lowest bidder, 79c. per ft.; U. S. Cast Iron Pipe and Foundry Co., lowest bidder for supplying 873 tons of 20-in. pipe, \$22.45 per ton.

Somerset, Pa.—Construction of a reservoir of concrete construction from plans of L. E. Chapin, Frick Bldg., Pittsburg, to W. G. Ferner, Somerset, \$4,191; other bidders on concrete construction were: H. C. Brooke, Uniontown, \$5,874; U. S. Construction Co., Columbus, O., \$4,431; Somerset Construction Co., Somerset, \$6,000, and J. C. McSpadden, Rockwood, \$6,077.

LIGHTING AND POWER

Eufaula, Ala.—Council will advertise for bids for erection of municipal light plant for the city on June 7.—W. L. Upton, Birmingham, Consulting Engineer.

Gadsden, Ala.—Franchise has been granted E. T. Hollingsworth, Chas. P. Smith, T. S. Kyle, E. R. LeFevre and John D. Dunlap to operate gas and electric company, using the alleys and streets of city for the pipe line and wires.

Tuscaloosa, Ala.—Tuscaloosa National Gas Co. has asked for franchise to pipe gas into city.—L. H. Maxwell, President.

Palatka, Fla.—F. P. Clark, Jacksonville, has petitioned Council for 30-year franchise to light streets with electricity; plant will cost \$40,000 to \$50,000.

Nampa, Ida.—L. L. Nurn has been granted franchise to install light, heat and power system; generating plant will be built on Nalad River.

Anderson, Ind.—C. W. Hooven, who controls natural gas franchise in this city, has announced that city will next winter be supplied with artificial gas and that work on gas producers will begin at once.

Fairfield, Ia.—Hall & Adams, Centerville, have been selected as engineers to prepare plans for improvements of electric light plant.

New Market, Ia.—Lee Electric Light Co. Clarinda, has been granted franchise to supply city with light.

State Center, Ia.—Municipal electric light plant has been destroyed by fire.

Burton, Kan.—Installation of gasoline engine and dynamo to supply electric light is being considered.

Nortonville, Ky.—Nortonville Traction Co. will erect electric plant for lighting.—Frank E. Mohr, President.

Kentwood, La.—Town is being surveyed for location of electric light and water works system.

Buchanan, Mich.—Citizens have voted in favor of giving Niles Gas Light Co. franchise to extend mains through village.

Brown Valley, Minn.—Installation of electric light system is being considered.

Delano, Minn.—Preliminary plans will be prepared by Oscar Claussen Engineering Co., St. Paul, for remodeling or building electric light plant.

Duluth, Minn.—Council has passed resolution calling for complete set of specifica-

tions, plans and surveys, with detailed statements of cost for the construction and equipment by city of a plant for furnishing electric light, heat and power.

Carthage, Mo.—Empire District Electric Co., M. R. Bump, General Manager, will make improvements.

Bloomfield, N. J.—Installation of municipal lighting plant is being considered.—Jas. E. Brooks, Chairman Lighting Committee.

Seaside Park, N. J.—Borough Council is considering \$35,000 expenditure on light, sewer and water plant.

Marion, N. Y.—Public Service Commission, Second District, has authorized the Marion Power Co. to construct and operate electric lighting plant.

Wilmington, N. C.—Tidewater Power Co. is considering installation of one 400-hp. boiler and other machinery at gas plant.

Bowbells, N. D.—National Briquetting Co., Kenmore, has asked Council for franchise to supply light and power.

Velva, N. D.—City has granted franchise to John Moore to build and operate electric light plant for period of 20 years.

Columbus, O.—Council has passed ordinance providing \$20,000 bond issue for proposed cluster light system.

Greenspring, O.—Village Council has granted franchise to D. M. Scott to build electric light and power plant.

Oklahoma City, Okla.—Oklahoma Gas and Electric Co. will extend electric light system to Britton at cost of about \$20,000.

Madras, Ore.—Council has passed an ordinance authorizing A. E. Hammond to construct and operate electric light and power plant.

Coatesville, Pa.—Town is considering erecting plant for electric street lighting.

Custer, S. D.—Custer Electric Light, Heat and Power Co. has been granted franchise to operate electric plant for a period of 50 years.—Edward L. Grantham, President.

Livingston, Tenn.—W. W. Hendricks, Cookeville, is considering installation of electric light plant.

McAllen, Tex.—Town has granted franchise to A. L. Stang, El Campo, for electric light plant.

Port Lavaca, Tex.—W. E. Shell & Co. are considering construction of electric light plant.

Waxahachie, Tex.—Council has granted franchise to Raymond G. St. John and Henry M. Wallace, of Detroit, Mich., to establish, maintain and operate gas plant.

Danville, Va.—Election on June 27 on \$150,000 bonds to improve and extend electric light system is being considered.

Monroe, Wash.—H. H. White, representing Everett Gas Co., has asked Council for franchise to extend the present system from Snohomish to this city.

Berlin, Ont., Can.—Ratepayers will vote May 31 on \$20,000 electric light by-law and \$7,900 by-laws for street railway.

South Qu'Appelle, Sask., Can.—Electric Light Co. is considering erecting a more substantial power house, and also installing gasoline power.—L. G. Bell, Secretary-Treasurer Board of Trade.

CONTRACTS AWARDED

Old Orchard, Me.—Furnishing city with 86 60-c.p. tungsten lights, \$25 per light per year.

Kansas City, Mo.—By Kansas City Electric Light Co. to Electric Storage Battery Co., Philadelphia, Pa., for installation of storage battery plant at substation, 6th and Wall sts., \$100,000.

Rockingham, N. C.—Continuing and completing construction of hydroelectric plant and 100 miles of transmission line, to F. W. Abbott & Co., 90 West st., New York, by Yadkin River Power Co.—Charles E. Johnson, Raleigh, President.

Stoughton, Wis.—Installation of electric light plant on the Yahara River, to the Power Engineering Co., Minneapolis, Minn., about \$75,000.

FIRE EQUIPMENT

Los Angeles, Cal.—Council has voted to adopt the report of Supply Committee, recommending purchase of aerial ladder truck, 65 ft. long and motor-driven, for \$10,834.

East Hartford, Conn.—Fire District is considering erection of \$1,000 addition to house of Volunteer Hose Co.

Martinsville, Ind.—Niagara County Commissioners have approved plans for construction of a concrete bridge 450 ft. in length, with 20-ft. roadway, across White River at Waverly; \$40,000 available. S. A. Blunk, Engineer.

Mishawaka, Ind.—Wm. S. Moore, City Engineer of South Bend, has prepared plans for \$65,000 concrete street bridge of four spans to be erected over St. Joseph River at Loxan st. if petition is granted by County Commissioners.

Shell Rock, Ia.—Board of Supervisors has decided to construct a bridge in Dayton Township at a cost of about \$5,000.

Kansas City, Kan.—Specifications have been prepared for the viaduct to be constructed over Reynolds ave. at 6th st.

Georgetown, Ky.—Scott County Commissioners will soon ask for bids for constructing seven highway bridges; Prof. Walter E. Rowe, College of Civil Engineering, State University of Kentucky, Lexington, has been employed as Designing and Inspecting Engineer.

Sanford, Me.—Bridge will be erected over Mousam River at River st.—H. E. Perkins, Moderator.

Fulton, N. Y.—Plans for proposed \$170,000 steel reinforced concrete bridge over the Oswego River at Broadway have been received by Board of Public Works; plans call for a bridge running from East 1st to West 1st st., 1,205 ft. in length, with a probable driveway of 34 ft.

Lowville, N. Y.—Town is considering election on \$9,000 bonds to construct concrete culvert across Mill Creek.

Washington, Pa.—Grand Jury has approved construction of following bridges: Over Pigeon Creek in the Borough of Monongahela City with a span of 110 ft., at estimated cost of \$18,000; bridge of 60-ft. span over the waters of Pigeon Creek in Borough of Bentleyville, \$5,333; over Brush Run in Peters Township at Thompsonville, with 41-ft. span; over Brush Run in Independence and Hopewell Townships near David Barr farm, with a 40-ft. span, \$4,015; over Peters Creek in the Borough of Finleyville, with 50-ft. span, \$4,445.10; Sparta bridge in Morris Township over Short Creek, with 18-ft. span, \$387.71.

Richmond, Va.—Board of Supervisors of Henrico and Hanover Counties are considering erection of bridge over Chickahominy River at Creighton road.

Spottsylvania, Va.—Spottsylvania County is considering construction of reinforced concrete and steel structural bridge across Po River at Snell.

CONTRACTS AWARDED

Bloomfield, Ind.—Constructing three bridges, to the Vincennes Bridge Co., Vincennes, Ind.

Bloomfield, N. J.—Building concrete and steel bridge over Third River and Morris Canal, at Baldwin st., to Linde & Griffith, Newark, \$12,995.

Chester, Pa.—Repairing four county bridges, to C. L. Franklin, Darby, about \$1,200.

Ebensburg, Pa.—By County Commissioners for the erection of bridges across Brubaker Creek, in Elder Township, to Polo Azzara, \$1,975, and at Portage, crossing Trout Creek, to Ashley J. Lord, \$2,300.

Richmond, Va.—Building Mayo bridge, to I. J. Smith & Co., \$224,734; Belgian block paving of roadbed, \$8,000; approaches according to the "yellow line" or modified grade, \$21,000; supervision and inspection, \$4,200; testing material, \$3,000.

BIDS RECEIVED

Passaic, N. J.—Constructing the drawbridge which is to span Passaic River at Rutherford ave. to the Bergen County side, Walter J. Harris, lowest bidder, \$60,375; other bidders: Stillman-Delehanty-Ferris Co., \$62,280; Pennsylvania Steel Co., \$73,140; F. W. Schwiers, Jr., \$67,749; Long & Miller, \$84,255; Snare & Triest Co., \$72,480; Northeastern Construction Co., \$77,983; Oswego Bridge Co., \$71,490; F. R. Long & Co., \$67,720; Oscar Daniels, \$87,000.

Philadelphia, Pa.—Widening Chestnut st. bridge over the Schuylkill River: M. & J. B. McHugh, \$74,084; Oswego Bridge Co., \$76,096; American Paving and Construction Co., \$77,519; Strabel Steel Construction Co., \$88,805; Richard Walsh, \$97,868; all bidders agreed to complete the work in 10 months; building double track steel plate girder bridge, with grading and paving of streets, on the line of Springfield ave. under Philadelphia and Baltimore Central Railroad, DeMonte Delise, eight months, \$32,874; William F. Mahoney, four months, \$33,216; P. F. Reilly, five months, \$33,314; McNichol Paving and Construction Co., five months, \$37,891; American Paving Co., 10 months, \$39,765; there were 13 bidders altogether, of which W. S. P. Shields was high at \$40,477; Shields was low bidder on rip-rapping, and other tender work on Passyunk ave. bridge piers, \$5,608.88; other bidders were American Paving and Construction Co., \$7,260, and Armstrong & Latta Co., \$7,537.

Fairmount, W. Va.—Building 4th st. bridge, Nelson-Merydith Co., Pittsburg, Pa., plan A \$12,187, plan B \$12,798, plan C \$15,198, plan D \$11,548, Plan E \$6,822, plan F \$6,375, plan G \$6,471, plan H \$6,122, plan I, \$11,241; American Bridge Co., New York, \$5,710; Robert H. Morfitt, Jr., Harrisburg, Pa., reinforced concrete, \$12,096; McClintic-Marshall Construction Co., Pittsburg, Pa., \$10,513; Faris Bridge Co., Pittsburg, Pa., \$6,985; difference in the prices is caused from fact that some companies gave bids for complete bridges, others for bridges without the floors completed, some for steel and some for reinforced concrete structures.

MISCELLANEOUS

Berkeley, Cal.—Citizens have defeated proposed \$1,000,000 bond issue for improvements.

Palo Alto, Cal.—Bids will be received May 22 for purchase of bonds to be used for the construction of a garbage crematory and auxiliary pumping plant.—J. T. Buxbee, Jr., City Engineer.

Old Forge, N. Y.—Citizens have voted \$2,500 to erect municipal building and engine house.

Youngstown, O.—Fully \$10,000 will be expended by Park Commission in beautifying local parks this spring.

Guthrie, Okla.—Citizens have voted \$100,000 bonds for improvements at Mineral Wells Park.

Beaver, Pa.—Citizens will vote June 17 on bonds for erection of borough hall.

Westerly, R. I.—Town will issue \$100,000 bonds for erection of town hall.

Humboldt, Tenn.—Citizens will vote on \$15,000 bonds to erect city hall.

Nashville, Tenn.—C. K. Colley, city, has prepared plans for erection of proposed public market.

Colville, Wash.—Jones & Levesque, Mobawk Bldg., Spokane, have prepared plans for erection of \$35,000 city market.

CONTRACTS AWARDED

Louisville, Ky.—By Board of Public Safety, to Oldsmobile Co., Lansing, Mich., for delivery of a motor patrol chassis to Central Police Station, to be used with motor patrol already in service; cost \$1,900; body of car will be built in Louisville; total cost about \$3,000.

Falmouth, Mass.—Erecting addition to town hall, to Chas. E. Robbins, \$3,774.

Eveleth, Minn.—Hauling city garbage for one year, to J. Smolik, summer months, \$283.35; winter months, \$215 per month.

Hibbing, Minn.—Furnishing garbage cans, to Thourin Hardware Co., city, 1,000 20-gal. cans, \$2.25 each and 150 30-gal. cans, \$2.75 each.

Great Falls, Mont.—Furnishing 2,000 ft. of hose for use on boulevards, to Strain Bros. 750 ft., to Murphy-Maclay 750 ft. and Northern Hardware Co. 500 ft.

Orange, N. J.—Scavenger contract, three years, to John N. Lohman & Co., \$16,266.66 per year.

New York, N. Y.—Repairs to the steamer Massasoit, to Waters-Colves Co., West New Brighton, S. I., \$14,938; other bidders: John W. Sullivan Co., \$15,200; James Shewan & Son, \$15,272; James Tregarthen & Son, \$15,500; John F. Walsh, Jr. & Co., \$15,970.

Svracuse, N. Y.—Completing municipal bath house, carpenter and mason work to Miller, Raleigh & Co., \$3,200.

Whitesboro, N. Y.—Sprinkling and sweeping paved streets for two years, to Utica Sweeping and Contracting Co., Utica.

Youngstown, O.—Building comfort stations in Lincoln and South Side Parks, to Thompson & Frame, \$672, and Arthur Chesney, \$790.

BIDS RECEIVED

Los Angeles, Cal.—Furnishing county jail with auto for highway repair work: R. C. Hamlin, Franklin motor truck, \$2,550; Whiting & Mead, Johnson, \$2,150; Pioneer Commercial Auto Co., Randolph, \$2,100, or a Rapid at \$2,950; Lord Motor Car Co., Garford, \$2,500; C. C. Henion, Standard, \$3,000; Hawley, King & Co., Grabowsky, \$2,450, or a Clark at \$1,750; M. S. Bulkeley & Co., Autocar, \$2,525.

Waycross, Ga.—Building county jail: Pauly Jail Co., brick, \$34,194.50; concrete, \$35,467.43; South Eastern Jail Co., brick, \$34,985; concrete, \$37,069; Park Mor Ran Co., concrete, \$34,984; brick, \$32,995.50.

Boston, Mass.—Construction of wood or steel ferryboat for East Boston service; steel construction, Maryland Steel Co., \$155,000, and W. & A. Fletcher Co. bidding \$129,950; wood construction, Bertelsen & Peterson Engineering Co., \$117,000, the boat to be finished in 11 months; Atlantic Works, \$121,450, boat to be finished in 7 months; William McKie's bid was \$120,750, boat to be finished in 7 months, and W. & A. Fletcher Co., \$127,450, to be finished in 8 months.

Boston, Mass.—Disposal of garbage and refuse for city districts of West Roxbury and East Boston excluded: Daniel P. Sullivan, formerly Superintendent of Sanitary Department, disposing of garbage, \$27,400 less than price the city is now paying New England Sanitary Disposal Co.; offer for garbage is \$24,995, and for refuse 44.9-10c. per ton; by this proposition city furnishes stations and does all work of carting; Jeremiah P. O'Riorden, Charlestown, will dispose of the garbage and waste and furnish all the scows necessary for the harbor work for \$197,000 first year; for each succeeding year of the nine remaining years he seeks an increase of 2 1-10 per cent over cost of the year preceding; Boston Disposal Co., \$234,940 a year with 2 1-10 per cent increase each year, as in case of O'Riorden; the Vulcan Incinerating Co., of New York, would build plant in Brighton with capacity of 18,000 tons daily, the cost of plant to be \$72,500, the same at the expense of city, and for disposing of garbage would charge 66 2-3c. a ton of 2,000 lbs.; another bid of the company was that of disposing of garbage and waste in Districts 1, 6, 7, 8, 9 and 10, about 316,000 tons annually, at rate of 66 2-3c. per ton; company would erect a station at Cow Pasture or on Deer Island at cost to city of \$276,000; Frank P. Neelon & Co. offered to dispose of garbage and waste at annual cost of \$189,000, city to erect and maintain collection stations; Joseph Marrone, of New York, offered to dispose of the garbage for 52c. a ton, or to do the work on ten-year contract for \$200,000 first year and increase of 2 per cent a year for remaining years; four propositions were contained in the bid of the Boston Development and Sanitary Co., submitted by William F. Donovan, President; first proposition provides for three water-front and two inland stations; the price for disposal would be \$184,000 the first year and 3 per cent increase each year; second proposition provides for three water-front and three inland stations; cost would be \$210,000 per year, plus 3 per cent yearly over the figure of the preceding year; third proposition provides for three water-front and two inland stations; in addition the company would furnish dump for ashes in swamp lands of New Haven road on the South Bay; price for disposal the first year would be \$200,000 plus the yearly increase of 3 per cent; fourth proposition provides for three water-front and three inland stations; dump for ashes is also included; price is \$220,000 a year, plus the yearly addition of 3 per cent.

New York, N. Y.—By Park Board, constructing Bushwick playground, bounded by Putnam ave. and Woodbine st. extension, between Knickerbocker ave. and Irving ave., Kelly & Kelley, 45 East 42d st., lowest bidder, \$23,234.

New York, N. Y.—Installing fire protection system and compressed air line on Manhattan Bridge over East River, between Manhattan and Brooklyn, as follows: Vulcan Rail and Construction Co., \$20,742; McHarg-Barton Co., \$22,200; M. J. O'Brien \$29,495; Oscar Daniels Co., \$24,900; A. Kaufman, \$28,000.

Spokane, Wash.—Furnishing three asphalt dump wagons for Street Department: J. I. Case Threshing Machine Co., \$200 each; Folson Implement Co., three for \$642; McGowan Bros. Hardware Co., three makes at \$180, \$193 and \$200 each; E. P. Jamieson & Co., \$209 each; T. J. Coffman Co., \$190 each.

Pennsylvania	Pittsburg	May 31, noon	Constr. 2 elliptical arch reinforced concrete stone faced bridges and 1 reinforced concrete semi-circular arch bridge	R. J. Cunningham, County Com. Fred G. Schwartz, County Clerk. Albert Sahn, County Auditor.
Kansas	Garland	June 6, noon	Constr. either a steel or conc. bridge across Drywood Creek	
Indiana	Indianapolis	June 12, 10 a.m.	Constr. a bridge over Fall Creek, on Capitol ave.	
MISCELLANEOUS				
Minnesota	Duluth	May 19, 10 a.m.	Furn. one 5-passenger automobile 40 to 60 H. P.; also one 3 or 4 passenger runabout	Olof G. Olson, Pres. Bd. Pub. Wks. Wilkes Barre Park Com.
Pennsylvania	Wilkes Barre	May 22, noon	Furn. one 35-in. horse lawn plow with shafts and seat	
Kentucky	Middlesboro	May 24, noon	Constr. a city building, courthouse, jail and fire department	Mayor.
Ohio	Cincinnati	May 25, noon	Furn. one automobile run about with rumble seat	John J. Wenner, Clk. Dept. P. S.

STREET IMPROVEMENTS

Sacramento, Cal.—County Supervisors are considering petition for road in eastern part of the Haggin Grant.

Summerville, Ga.—Bids will be received June 1, noon, for \$45,000 bonds for street improvements.

Morocco, Ind.—Jackson Township has voted to build extensive system of stone roads.

Fairfield, Ia.—Hall and Adams, Center-ville, have been selected as engineers to prepare plans for about 3 miles of street pavements.

Nevada City, Cal.—Supervisors have decided to ask bids for building piece of road along Cherry Creek at cost of \$2,000.

Lexington, Ky.—Bids will be readvertised for construction of Clay, Ashland, Columbia and other avenues with macadam; West 3d st. will be resurfaced with sheet asphalt from Jefferson to Henry.

Springport, Mich.—Village Council has \$800 available for graveling and improving road leading to Duck Lake.

Bemidji, Minn.—Citizens will vote May 31 on \$20,000 bonds for paving streets.

Fremont, Neb.—Cost of paving portion of H st. has been estimated at \$12,500.

Atlantic City, N. J.—State Road Commissioner Stevens has given approval to widening of roadway out of May's Landing to Cape May, at dangerous points, and also for its rebuilding.

Clinton, N. J.—Public road from Lebanon to this town is to be macadamized this year.

Trenton, N. J.—Ordinances will be prepared for paving North Stockton st. with asphalt and North Willow st. with vitr. brick.

Binghamton, N. Y.—Citizens will vote June 9 on \$10,000 bonds for laying proposed brick pavement on Main st.

Franklin, Pa.—Council has decided to repave Liberty st.

Mauch Chunk, Pa.—Carbon County Commissioners will build road from Fairview, via White Haven, to Freeland and Hazleton, to cost \$195,000.

Paterson Heights, Pa.—Council is considering macadamizing of Darlington road.

Washington, Pa.—Washington County Grand Jury has approved nine sections of road to be improved with brick.

Beaumont, Tex.—County Commissioners are considering \$5,000 expenditure on proposed county road to Mansfield Ferry.

Fort Worth, Tex.—City Commission has adopted resolution for paving Daggett st. from Summit ave. to South Main st.

McKinney, Tex.—Celina Precinct will vote on \$125,000 bonds for good roads purposes.

Troup, Tex.—Citizens of that portion of Cherokee County lying east of Mud Creek and composing one of the commissioner's precincts of county are agitating question of bond issue for the construction and repair of public roads of precinct.

Waco, Tex.—County Commissioners will consider calling election June 20 on \$600,000 bonds to build good roads in McLennan County.

Danville, Va.—Citizens will vote June 27 on \$150,000 bonds to pave North Warren st. and improve electric light.

Farmville, Va.—South Main st. will be improved at cost of \$5,000.

Richmond, Va.—State Commissioner of Highways P. St. Julian Wilson has announced apportionment of State good roads fund; Warwick County will receive \$1,124.81; Elizabeth City, \$3,093.23; York, \$788.85; Isle of Wight, \$2,000; Nansemond, \$4,132, and James City, \$538.

Tacoma, Wash.—City Commission has adopted resolution providing for improvement of Portland ave. by grading and planking and South Twenty-fifth st., East C and East D sts. by paving with sandstone and brick.

Ashland, Wis.—County Board has passed resolution which will place at disposal of County Highway Commissioner \$13,700 for building a county road from Ashland to Price County.

CONTRACTS AWARDED

Oakland, Cal.—Paving 7th st., by Southern Pacific Co., to Oakland Paving Co.

Redondo Beach, Cal.—By City Trustees, to Fiachilds-Gilmore-Wilton Co., Los Angeles, for paving Pacific ave. from the southerly city limits to its junction with Benita ave.; paving will be of asphalt concrete.

Detroit, Mich.—Paving with cedar block portions of Waterloo st., Cantor and Iroquois ave., to J. S. Affeld, 761 Campbell ave., \$31,340.

Danville, Pa.—Paving East Front and Bloom sts., to Corve'l Construction Co.; curbing, to T. L. Evans Sons.

Springdale, Pa.—Grading 30,000 cubic yards. Thoney Pietro, Morgantown, W. Va., \$10,500; work also includes building of

sewer and water mains at a total cost of \$100,000.

Washington, Pa.—Construction of three Washington County roads that are to be improved with brick; to the Donora Construction Co., Charleroi-Bentleyville road, \$31,808.20, not including furnishing of the brick; road is to be three miles in length; to John F. Howley & Co., Pittsburg, to build the Prosperity-Dunns Station road and McDonald-Venice road, \$23,671.50 and \$11,612.06, without the brick; former road is two miles in length, extending from Prosperity towards Dunns Station; latter road is one mile in length, extending from the McDonald borough line; furnishing brick, to the United Fire Brick Co., Uniontown, two miles of Charleroi-Bentleyville road, \$15.50 per 1,000, or 65c. per sq. yd.; remaining one mile will be furnished by J. M. Porter, a highway block, \$17.25 per 1,000 or 58.65c. per sq. yd.; also highway block for the McDonald-Venice road, \$16 per 1,000 or 54.4c. per sq. yd.; Waynesburg Brick Co. is the lowest bidder on Prosperity-Dunns Station road, but the contract has not yet been let.

Houston, Tex.—To Horton & Horton, city, to pave Washington ave., \$11,159.

Racine, Wis.—Paving Erie st., to White Construction Co., Milwaukee, \$1.89 per yd. for asphalt and 55c. per ft. for curb and gutter.

BIDS RECEIVED

Jacksonville, Fla.—Laying total of 167,767 square yards of vitrified brick pavement on various streets of the city and involving approximate expenditure of \$325,000; Engineering & Paving Co., Jacksonville, was lowest in its bids on 71,855 square yards, prices ranging from \$1.55 to \$1.75, while Georgia Engineering Co., Augusta, Ga., came within figures on 59,110 square yards, prices \$1.60 to \$1.74; the Graves-Matthews Paving Co., Birmingham, Ala., on 22,827 square yards, prices \$1.65 to \$1.73, and Alabama Paving Co., Birmingham, on 12,973 square yards, prices, \$1.61 to \$1.67; 5c. is allowed for maintenance.

Duluth, Minn.—Furnishing a gyratory rock crusher, which will be installed at the Point of Rocks, near Thirteenth ave. West and Superior st.; The Austin-Western Co. bid \$1,047, \$1,342 and \$1,650, and G. E. Ingersol, \$1,630, \$1,825 and \$2,037, according to kind.

Altoona, Pa.—Resurfacing paved streets; Duster Paving Company, of Tarentum—

Removing old paving, per sq. yd., 20c.; asphalt block, as specified, per sq. yd., \$1.65; 3-in. asphalt block, per sq. yd., \$1.86 and \$1.88; repairs during guaranteed period, 50, 33, 25 and 25 per cent.; The Standard Bitulithic Company, of New York.

Removing old paving, 20c. per sq. yd.; for bitulithic block, per sq. yd., \$1.35; repairs during guaranteed period, 50, 33, 25 and 25 per cent.; The Barber Asphalt Company, of New York.—Removing old paving, 10c. per sq. yd.; for paving, per sq. yd., \$1.27; for repairs during guaranteed period, 45, 30, 20 and 20 per cent.; in presenting its bid the Barber people said it was understood that it was for all work, aggregating 50,000 sq. yds.; The Monroe Paving Company, of New York.—Bituminous concrete, per sq. yd., with binder, \$1.06; without binder, 85c.; for repairs during guaranteed period, 40, 30, 25 and 25 per cent.; The W. J. McElhany Company, of Pittsburgh.—Removing old paving, 23c. per sq. yd.; for asphalt block, according to specifications, \$1.65 per sq. yd.; for 3-in. asphalt blocks, \$1.86; for repairs during guaranteed period, 50, 33, 25 and 25 per cent.

SEWERAGE

Summerville, Ga.—Bids will be received June 1, noon, for \$30,000 bonds for sewer and water extension.

Toccoa, Ga.—Time for letting contracts for proposed sewerage system has been extended to June 20.—D. E. Hogsed, Chairman, Sewerage Committee.

Libby, Mont.—Council is considering election on \$15,000 bonds to install sewer system.

Palmyra, N. J.—Installation of sewer system is being considered.

Ashland, Wis.—Board of Public Works will at once ask bids for construction of sewers.—City Comptroller Dillon, Chairman.

CONTRACTS AWARDED

Dallas, Tex.—Building storm sewer on South Harwood st., Jackson and First sts., to Dallas Lime & Gravel Co., \$13,089.59.

Springdale, Pa.—Building sewers to Thoney Pietro, Morgantown, W. Va.: 470 lineal feet, 20-inch pipe sewer, \$1.49; 1,170 lineal feet 18-inch, \$1.195; 970 lineal feet 15-inch, \$1.11; 9,640 lineal feet 12-inch, 80c.; 10,530 lineal feet 10-inch, 77c.; 13,850 lineal feet 8-inch, 73c.; 83 manholes, \$39.50; 28 lampholes, \$10; 5 flush tanks, \$75, and 60 cubic yards concrete embankment, \$10.

WATER SUPPLY

Summerville, Ga.—Bids will be received June 1, noon, for \$30,000 bonds for water and sewer extension.

Marquette, Mich.—Citizens have voted \$75,000 bonds to extend water works intake pipe additional 3,000 feet into Lake Superior.

Trenton, N. J.—George A. Johnson has been selected by Water Board to prepare at once plans for chloride purifier for this city; the idea of the board is to have the plant placed at the pumping station.

Trenton, N. J.—Judge Rellstab has decided that United States government might proceed at once to condemn the lands desired by it in Essex, Hudson and Bergen counties for the purpose of laying pipes to carry New Jersey potable water to fortifications at the Narrows, in New York Harbor, especially those in Richmond Borough. Government has contract with Hudson Water Co., which is in hands of a receiver.

Salt Lake City, Utah.—County Commissioners have decided to install pump near county reservoir.

Tacoma, Wash.—City Commission has adopted ordinance providing for construction of water mains in Dist. No. 573.

CONTRACTS AWARDED

Springdale, Pa.—Building reservoir and water mains to Thoney Pietro, Morgantown, W. Va.: 1,900 cubic yards reservoir excavation, \$2.75; 850 square yards reservoir lining, \$3; 50 lineal feet 8-inch cast-iron cleansing pipe, \$3; 300 lineal feet 8-

inch T. C. overflow drain, \$1.00; 400 lineal feet reservoir fence, \$1.00; 7,710 lineal feet 10-inch water line, \$1.02; 5,780 lineal feet 8-inch, 83c.; 14,730 lineal feet 6-inch, 64c.; 7,140 lineal feet 4-inch, 49c.; 40 fire hydrants, \$30.

Salt Lake City, Utah.—Installation of centrifugal pump to Fairbanks-Morse Co., \$645.

LIGHTING AND POWER

Gravette, Ark.—Harry V. Forest, of Kansas City, has made a proposition to Council for the purchase of lighting plant.

Tucumcari, N. M.—Tucumcari Electric Light Co. is planning improvements to cost \$10,000.

Haddonfield, N. J.—Installation of municipal electric light plant is being considered; cost about \$40,000.

Danville, Va.—Citizens will vote June 27 on \$150,000 bonds to improve electric light plant and pave North Warren st.

CONTRACTS AWARDED

Wheeling, W. Va.—Work in connection with changing present gas works to burning gas plant, removing upper retort and erecting new building, to Bushon & Leham, \$10,109; furnishing water-gas apparatus, consisting of 8-ft. 6-in. sets, cast-iron floor, condenser, elevator and oil tank, to Union Gas Improvement Co., Philadelphia, \$25,393; furnishing pumps to M. T. Davidson & Co., New York, \$185 for iron pumps and \$200 for brass; two of each kind will be used.

FIRE EQUIPMENT

Catlettsburg, Ky.—City will erect fire house and city building at Main St. and Broadway.

Virginia, Minn.—Fire Commissioner has rejected all bids for remodeling Fire Hall No. 1 and will do work by day labor.

CONTRACT AWARDED

Virginia, Minn.—Furnishing auto fire truck to Waterous Engine Works, St. Paul, \$5,500.

BRIDGES

Lawrence, Mass.—City Engineer Marble will prepare plans for proposed White Pups bridge.

Fort Worth, Tex.—Plans, specifications and bids for a 90-foot bridge of reinforced concrete that is to span Marine creek at Twenty-third st. will soon be advertised for by County Commissioners of Tarrant County.

Spokane, Wash.—Bids will be received June 15, noon, for \$415,000 bridge bond issue.—Jas. McGougan, City Auditor.

MISCELLANEOUS

Greenville, Ala.—Erection of jail is being considered.

Catlettsburg, Ky.—City will erect city building and fire house at Main st. and Broadway.

Duluth, Minn.—Health Department is asking for auto trucks for garbage collection.

Syracuse, N. Y.—Resolution asking Board of Contract and Supply to advertise for bids to excavate with steam shovels more than 125,000 cubic yards of earth at Lincoln and Onondaga parks has been passed by the Syracuse Park Commission; commission also decided to buy apparatus for Lincoln School playgrounds, including swings, ladders, horizontal bars, toboggan slides and giant strides.

CONTRACTS AWARDED

Boston, Mass.—To William McKie, East Boston, for double-screw ferryboat for city, \$120,750.

Duluth, Minn.—Rebuilding old Quebec pier at foot of Becker Ave. to Interstate Dredge & Dock Company, \$5,896.98.

INDUSTRIAL NEWS

(Continued from page 726)

Jamestown Block.—William A. Howell, engineer of the street department of the Board of Works, Newark, N. J., visited Jamestown, N. Y., the latter part of last week to make an inspection at first hand of a type of brick pavement known as Jamestown block, which has been mentioned recently in connection with prospective paving contracts. He found that the block had been in extensive use in Jamestown and that it had given excellent satisfaction there. At the plant where it is manufactured he was informed that the demand for it had been so great that largely increased facilities were being provided. Certain features of the process used in making the blocks were interesting and out of the ordinary, Mr. Howell says. There was a brick-cutting machine which was "almost human," he expressed it.

"One special advantage which is claimed for the Jamestown block," Mr. Howell is reported as saying, "is its evenness of quality. This claim appeared to be substantiated by the results of the long service it has given in the Jamestown streets. It has not worn down in patches, as in streets where the quality of the pavement does not run even. Of course it has not had the volume of traffic it would in our busier streets."

Testing Wells.—Tests of the artesian wells, sunk at Mishawauka for the city's water supply were made last week under the direction of Consulting Engineer Dabney H. Maury and Water Works Superintendent C. F. Crabill. There are five wells, varying from 200 to 300 feet deep, and the water rises to within 6 feet of the surface. Harris Air Pumps have been installed. Engineer Maury, after the first test, stated that the wells were doing better than 2,000,000 gallons in 24 hours. Mr. Maury also stated that in nearly every test he had ever attended the first day was marked by breakdowns of some character, but on this occasion none occurred.

Consulting Engineer.—P. R. Moses, consulting engineer, 366 Fifth Avenue, New York City, who specializes in the handling of industrial equipments, announces that the following engineers have been added to his staff: John Fallon, Industrial Engineer, recently Mechanical Engineer of the Tennessee Copper Company, and Stanley G. Flagg & Company; Arthur V. Farr, M. E. Textile Engineer, formerly Szepesi & Farr, 90 West Street; Alfonse Kaufman, E. E., formerly Manager and Chief Engineer Alaska Chemical Company, and associated with Charles B. Jacobs Industrial Laboratories; J. N. Walton, recently Power Engineer and Storage Battery Expert, Brooklyn Edison Company.

MODEL OF PROPOSED PHILADELPHIA PARKWAY, CITY PLANNING EXHIBIT

Scale 1-32 of an inch to the foot

CITY PLANNING EXHIBIT AND CONFERENCE

Held in Philadelphia Last Week—Largest Municipal Planning Exhibit Ever Held in This Country—
Effectiveness of Models Demonstrated—Street Dimensions—Surface and Subsurface Construction

IN connection with the third annual conference on City Planning in Philadelphia last week there was on view in the City Hall an exhibit which had been arranged by the officials of that city, assisted to a certain extent by suggestions from the members of the executive committee of the conference, which is to remain open to the public until June 15, and which is undoubtedly the best exhibit of the kind which has yet been collected together in this country and the first given by a municipality. In mere magnitude it excels other exhibits which have been held by private organizations, the length of the line of charts and maps arranged along the walls of the corridors totaling one-half to three-fourths of a mile, in addition to which there were

models and other forms of display and of conveying information. These exhibits were contributed by from 35 to 40 American cities and a number of European ones, in addition to which a number of exhibits were made by individuals showing suggested or developed improvements for a number of other cities, bringing the total number of cities represented up to about 75.

Mere abundance of material, however, is by no means a commendable feature of such exhibit, and, in fact, has been found in other exhibits of a similar nature to be a decided drawback since the very multiplicity of charts, figures, "suggestions," "studies," "proposed plans" and the like have so overwhelmed

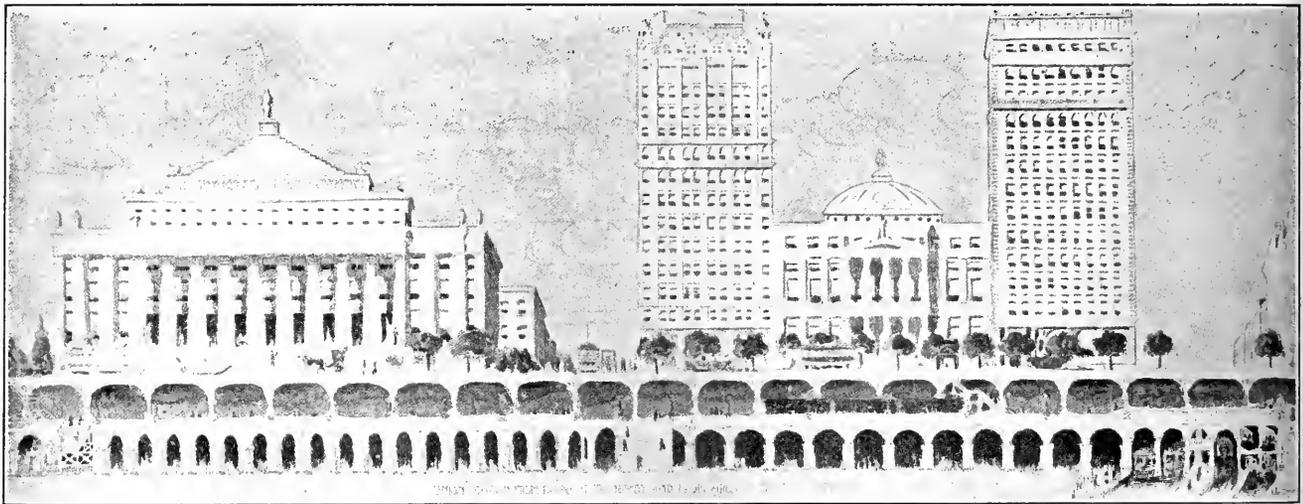

the visitor as to permit him to carry away no definite idea, unless that of the great disproportion between the amount of work devoted to such studies and plans and the number which have been actually carried out. In this exhibit, while there was room for criticism of this kind, an effort had evidently been made and with some success to have the exhibit more practical in its nature, to substitute photographs of realized conditions for wash drawings of architectural dreams, and to introduce models and other forms of representation of topography and city construction for the work of draftsmen, which is not so readily understood by the average citizen. One thing which impressed the writer in connection with this use of models was the fact that even those who are thoroughly familiar with the interpretation of drawings found that they could much better appreciate actual conditions when they were presented to them in the form of a model made accurately to scale.

Undoubtedly the most elaborate feature of the exhibit was the model prepared by the city of Philadelphia showing the proposed parkway leading from the City Hall northwest to Fairmont Park. This model is about 5 feet wide and 35 feet long, and shows, constructed accurately to scale, all the buildings in the blocks touched by the parkway, either those now existing, which

checker-board system, showing the excessive grades produced.

The two models last referred to differed from most of the others in that they represented actual rather than proposed conditions. Another interesting model representing plans which were well on toward completion was sent by the city of Des Moines, Ia. This was a model of the municipal buildings on opposite banks of the Des Moines River. The plan illustrated by the model includes five buildings and four bridges, of which four buildings are nearly or quite completed and two bridges.
